The common names are presented in two lists. In the first an effort is made to bring together, in alphabetical order, all the common names that have been applied to the sunfishes in the United States and Canada, to show the distribution of these names, and to identify the species to which each common name is given. Practically all the names in print are recorded, together with a number of others reported by correspondents and associates, which have apparently not been printed.

The following explanations of the list are given:

1. The vernacular names are arranged in strict alphabetical order, and are recorded in the various forms in which they are spelled or pronounced. The fish may be identified by its vernacular name by noting its technical name, and then, if necessary, referring to the latter in the systematic list of the members of the family.

2. The geographical distribution of the names is indicated as accurately as possible. Names used over a wide area and appearing often in print are marked "general." The absence of locality indicates either a lack of knowledge as to where the name is employed or the appearance of the name only in books.

3. Whenever practicable a reference is given to a published record of the use of the name for the species and region cited. In the case of many names this record was the first known, but for other names, whose earliest application has not been determined, it has been considered sufficient to refer to a standard work. [These references are here omitted.]

The second list comprises the scientific and approved vernacular names of the *Centrarchidae*, and under each species all the common names that have been applied to it.

Notes and Comments on the Common Names.

The fertile imagination of Rafinesque induced him to coin many names for the members of this family, and he is responsible for a large proportion of the book names mentioned in the list. More recent writers have, however, contributed a number of such names, as will appear from the list. In some cases, where common names are given without comment in local lists of fishes and in general works, it has not been possible to determine whether they were in actual use or simply supplied by the writers. This compilation is therefore probably subject to correction in a number of such names which could not be corroborated from other sources.

The names "sunfish," "bream," and "perch" are applied with little discrimination to all the smaller species, more especially those of the genera *Lepomis* and *Eupomotis* in the Southern States. "Bream" is often corrupted to "brim," and "perch" to "peerch" or "pearch." The same names are also given to *Pomoxis*, *Ambloplites*, *Chenobryttus*, and *Centrarchus*, with or without qualifying words.

The name tobacco-box, which is applied to *Eupomotis gibbosus* in Maryland and Virginia, doubtless was based on a real or supposed resemblance in size, form, or color to the old-fashioned pocket receptacle for smoking and chewing tobacco. In regard to another fanciful name of this fish, Frank Forrester remarked that "the numerous spots on its body have procured for it the absurd name of pumpkin-seed in many States."

The two members of the genus *Pomoxis* are very similar in appearance and habits, and exist together in many waters. It is, therefore, no wonder that they bear many of the same common names, although each has some particular appellations.

"Strawberry bass and calico bass seem to be very appropriate designations for *Pomoxis sparoides*, and have the additional advantage of being already generally in use in a large district." (Goode.) For *Pomoxis annularis*, crappie may be recommended.

The names "campbellite" and "newlight," which appear to have originated in Kentucky, and to have spread thence to Indiana and Illinois, are said by Goode to have been given to *P. annularis* "by the irreverent during the great Campbellite movement in the West nearly half a century ago," and Klippart shows the origin of the name in Kentucky by recalling that the fish "appeared in the waters of that State simultaneously with the advent of the disciples of Rev. Alexander Campbell." These names are seldom heard nowadays, but are carried along in the books on fishes, and are interesting nomenclatural relics. That they have not entirely died out, however, is shown by the fact that as late as January, 1903, the Fish Commission received from Kentucky an application for "newlights" for stocking a pond, and Dr. S. P. Bartlett, of the United States Fish Commission station at Quincy, Ill., reports that he has occasionally heard the name "campbellite" in that State. Klippart attaches these names to *P.*

sparoides, but other writers have restricted them to *P. annularis*.

Monsieur Montpetit ("Les poissons d'eau douce du Canada") thus discusses the names crappie and crapet: "Crapet? Nothing similar exists in any French dictionary to designate a fish. I have reason to believe that the American word crappie is simply a transformation by the ear of the Canadian word *crapet*, which must have been applied to this fish a long time before the colonists of New England could have known it. Whether this fish took the name of *crappie* in the limpid waters of the Great Lakes or in the muddy waters of the mouths of the Mississippi, there is not less reason to believe that this name is only the alteration of the French word *crapet* which was given to it, either in Canada or Louisiana, a century and more before the English had become acquainted with it. *Ah! le crapet!* That is an essentially Canadian expression which we have all heard from the mouth of our mother, when for some teasing trick or mischievous act she threatened us with soft and affectionate blows. *Ah! le crapet!* Which meant: 'No matter by what end he is taken, he is always bristling, ready to do us an injury—he is a crapet.'"

The euphonious French name *sac-à-lait* (bag of milk) which is heard in the lower Mississippi Valley and now apparently is applied to other centrarchids as well as to *P. annularis*, to which it was originally given, has been corrupted to "suckley perch" in Louisiana near New Orleans. John Demon and shad, names mentioned by Mr. Goode as being applied to the crappie, have not recently been heard, and their geographical distribution is unknown to the compiler. According to Professor Evermann, tin-mouth and paper-mouth are names now often heard in Indiana, the former having reference to the color of the inside of the mouth of the crappie, the latter to the fact that the mouth tears easily when hooked.

Of the numerous names applied to members of the genus *Micropterus*, none is so distinctive as black bass, with the qualifying terms large-mouthed and small-mouthed, and these are the designations which should be generally adopted and adhered to, even though few, if any, specimens are really black.

Mr. Goode recalls that "Charlevoix, a Jesuit missionary who explored Canada in 1721, mentions a fish called *achigan*, which is thought to have been the large-mouth." M. Montpetit, in his "Les poissons d'eau douce du Canada," has adopted *achigan* as the most appropriate vernacular name, and writes as follows regarding it:

"In the Province of Québec, in more than one American State, the name *achigan* will persist and will perhaps finally prevail even on the continent of Europe. By priority, recognized as a principle by the naturalists of Europe and America, it has incontestable titles, since for centuries and centuries, doubtless, before Laudonnière called this fish *salmoides*, the aborigines of Canada designated it under the name *achigan*. It is a name of terror, the Algonquin name, picked up by Charlevoix and religiously preserved among us. One savant, versed in the savage languages, the Rev. Father Lacomb, O. M. I., has claimed that the word means the fish which disputes, which struggles, which shakes and bungles the line. Those who have seen it at work will admit that that is just its description."

Alphabetical List of the Common Names of the Basses and Sunfishes.

¹ Achigan—Canada.....	<i>Micropterus salmoides</i> .
Achigan.....	<i>Micropterus salmoides</i> .
Achigan grand bouche.....	<i>Micropterus salmoides</i> .
Achigan noir.....	<i>Micropterus salmoides</i> .
Achigan petite bouche.....	<i>Micropterus dolomieu</i> .
Bachelor—Iowa.....	<i>Pomoxis sparoides</i> .
Bachelor—Ohio Valley.....	<i>Pomoxis annularis</i> .
Bachelor perch—Ohio River.....	<i>Pomoxis annularis</i> .
Banded sunfish.....	<i>Enneacanthus obesus</i> .
Banded sunfish.....	<i>Mesogonistius chactodon</i> .
Bank-lick bass—Ohio.....	<i>Pomoxis sparoides</i> .
Bar-fish—Lake Michigan—Wisconsin.....	<i>Pomoxis sparoides</i> .
Bass—General.....	<i>Micropterus</i> .
Bass hog-fish.....	<i>Micropterus dolomieu</i> (young).
Bass sunfish.....	<i>Acantharchus pomotis</i> .
Bayou bass—Southern States.....	<i>Micropterus salmoides</i> .
Big-ear sunfish.....	<i>Lepomis megalotis</i> .
Big-fin bass.....	<i>Pomoxis sparoides</i> .
Big-mouth—Upper Mississippi Valley.....	<i>Chenobryttus gulosus</i> .
Big-mouth bass—General.....	<i>Micropterus salmoides</i> .
Big-mouthed black bass—General.....	<i>Micropterus salmoides</i> .
Big-mouthed sunfish—Kentucky—Ohio.....	<i>Chenobryttus gulosus</i> .
Big-mouthed trout—Kentucky.....	<i>Micropterus salmoides</i> .
Big-nosed sunfish.....	<i>Apomotis ischyrys</i> .
Bitter-head—Ohio.....	<i>Pomoxis sparoides</i> .
Black-banded sunfish.....	<i>Mesogonistius chactodon</i> .
Black bass—General.....	<i>Micropterus</i> .
Black bass of the Huron.....	<i>Micropterus salmoides</i> .
Black crappie—Illinois.....	<i>Pomoxis sparoides</i> .
Black-eared pond-fish.....	<i>Lepomis pallidus</i> .
Black-eared pond-fish.....	<i>Lepomis auitus</i> .
Black-eyes—Ohio Valley.....	<i>Lepomis megalotis</i> .
Black-eyes—Ohio Valley.....	<i>Lepomis cyanellus</i> .
Black-eye sunfish.....	<i>Lepomis cyanellus</i> .
Black fresh-water bass.....	<i>Micropterus dolomieu</i> .
Black Huron.....	<i>Micropterus salmoides</i> .
Black perch—Ohio Valley; Miss.; Tenn.....	<i>Micropterus dolomieu</i> .
Black sunfish—Mississippi.....	<i>Chenobryttus gulosus</i> .
Black sunfish—Ohio.....	<i>Ambloplites rupestris</i> .
Black-tailed sunfish—Ohio Valley.....	<i>Lepomis megalotis</i> .
Black warmouth.....	<i>Chenobryttus gulosus</i> .
Bloody sunfish.....	<i>Lepomis megalotis</i> .
Blue-and-green sunfish.....	<i>Lepomis cyanellus</i> .
Blue bass—Ohio Valley.....	<i>Lepomis cyanellus</i> .
Blue bream—General.....	<i>Lepomis pallidus</i> .
Bluefish—Ohio Valley.....	<i>Lepomis cyanellus</i> .
Blue-gill (or blue gills)—Maumee River, O.; Michigan.....	<i>Lepomis pallidus</i> .
Blue-gilled bream—Michigan.....	<i>Lepomis pallidus</i> .
Blue joe—North Carolina.....	<i>Lepomis pallidus</i> .
Blue-mouthed sunfish.....	<i>Lepomis pallidus</i> .
Blue perch—North Carolina.....	<i>Lepomis pallidus</i> .
Blue sunfish—General.....	<i>Lepomis pallidus</i> .
Blue sunfish—Ohio.....	<i>Lepomis cyanellus</i> .
Blue-spotted sunfish.....	<i>Lepomis cyanellus</i> .
Blue-spotted sunfish.....	<i>Enneacanthus simulans</i> et <i>gloriosus</i> .
Bream—Maine; Massachusetts.....	<i>Eupomotis gibbosus</i> .
Bream—Maine.....	<i>Lepomis auitus</i> .
Bream—Southern Atlantic States.....	<i>Ambloplites rupestris</i> .
Bream—Southern Atlantic States.....	<i>Chenobryttus gulosus</i> .
Bream—Southern Atlantic States.....	<i>Lepomis auitus</i> .
Bream—Southern Atlantic States.....	<i>Eupomotis gibbosus</i> .
Bream—Southern States; general.....	<i>Lepomis</i> , <i>Eupomotis</i> , etc.
² Brème—Quebec.....	<i>Ambloplites rupestris</i> .
Bride Perch—Ohio.....	<i>Micropterus salmoides</i> .
Bridge perch.....	<i>Pomoxis annularis</i> .
Brilliant sunfish.....	<i>Lepomis megalotis</i> .
³ Brim (see bream)—General; South.....	<i>Lepomis</i> , <i>Eupomotis</i> , etc.
Bronze-backer.....	<i>Micropterus dolomieu</i> .
Bronzed centrarchus.....	<i>Ambloplites rupestris</i> .
Brown bass—Ohio Valley.....	<i>Micropterus dolomieu</i> .
Brown river bass.....	<i>Micropterus dolomieu</i> .
Brown trout—Ohio Valley.....	<i>Micropterus dolomieu</i> .
Buffalo bass—Michigan.....	<i>Chenobryttus gulosus</i> .

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Buffalo sunfish—Michigan.....	Lepomis cyanellus.
Butter-fish—Illinois.....	Pomoxis sparoides.
Calico bass—General.....	Pomoxis sparoides.
Calico bream—South Carolina.....	Pomoxis sparoides.
Campbellite—Kentucky.....	Pomoxis sparoides.
Campbellite—Kentucky; Indiana; Illinois.....	Pomoxis annularis.
Chain-sided sunfish.....	Lepomis macrocheirus.
Chain side.....	Lepomis macrocheirus.
Chinquapin perch—Florida.....	Lepomis punctatus.
Chinquapin perch—Lower Mississippi Valley.....	Pomoxis annularis.
Chinquapin perch—North Carolina.....	Pomoxis sparoides.
Chub—North Carolina.....	Chenobryttus gulosus.
Chub—North Carolina; Virginia.....	Micropterus salmoides.
Chub rosin—North Carolina.....	Eupomotis gibbosus?
Common bass.....	Micropterus salmoides.
Common sunfish.....	Eupomotis gibbosus, Lepomis megalotis.
Copper-headed bream—Florida.....	Lepomis pallidus.
Copper-nosed bream—General.....	Lepomis pallidus.
Cow Bass—Indiana.....	Micropterus salmoides.
*Crappet.....	Pomoxis, etc.
Crappet calicot.....	Pomoxis sparoides.
Crappet jaune.....	Eupomotis gibbosus.
*Crappet mondoux.....	Ambloplites rupestris.
Crappet noir—Montreal.....	Ambloplites rupestris.
Crappet vert.....	Ambloplites rupestris.
Crappie—General.....	Pomoxis annularis.
Crappie—North Carolina; general.....	Pomoxis sparoides.
Crappie (see crappie).....	
Cropper (see crappie).....	
Cropper—Missouri.....	Ambloplites rupestris.
Cropper (see crappie).....	
Dollardee—Kentucky.....	Lepomis pallidus.
Dolly Varden—Illinois.....	Pomoxis sparoides.
Dotted painted-tail.....	Micropterus salmoides.
Dwarf bass.....	Micropterus dolomieu.
Eared sunfish.....	Lepomis megalotis.
Female perch—Maine.....	Eupomotis gibbosus.
Flat-fish—Maine; Massachusetts.....	Eupomotis gibbosus.
Flat-fish—Maine.....	Lepomis auitus.
Flier (or flyer)—North Carolina.....	Centrarchus macropterus.
Flounder—Maine.....	Lepomis auitus.
Flounder—Maine.....	Eupomotis gibbosus.
Flying perch—North Carolina.....	Centrarchus macropterus.
Fresh-water bass.....	Ambloplites rupestris.
Fresh-water perch.....	Eupomotis gibbosus.
Fresh-water sunfish.....	Lepomis auitus.
Fresh-water trout—S. C.; Ga.; Fla.....	Micropterus salmoides.
Gilded sunfish.....	Lepomis macrocheirus.
Goggle-eye—General in West.....	Ambloplites rupestris.
Goggle-eye—General; N. C.; Tex.....	Chenobryttus gulosus.
Goggle-eye—Southern States.....	Pomoxis sparoides.
Goggle-eye.....	Pomoxis annularis.
Goggle-eyed bass—Ohio.....	Ambloplites rupestris.
Goggle-eyed perch—Southern States.....	Pomoxis sparoides.
Goggle-eyed perch—Louisiana.....	Lepomis auitus?
Gold bass—Ohio Valley.....	Micropterus dolomieu.
Goldfish—Ohio, etc.....	Lepomis macrocheirus.
Gold ring pomoxis.....	Pomoxis annularis.
Grass bass—Indiana; Minnesota.....	Micropterus salmoides.
Grass bass—Lake Erie; Ohio; Ill.; Miss. V.....	Pomoxis sparoides.
Gray bass—Michigan.....	Micropterus salmoides.
Green bass—Michigan; Ohio River.....	Micropterus salmoides.
Green bass—Kentucky.....	Micropterus dolomieu.
Green perch.....	Micropterus sp.
Green sunfish—General.....	Lepomis cyanellus.
Green trout—Louisiana.....	Micropterus salmoides.
Green trout—Kentucky.....	Micropterus dolomieu.
*Growler.....	Micropterus salmoides.
Harlequin roach.....	Eupomotis gibbosus.
Hog bass—Ohio Valley.....	Micropterus dolomieu (young).
Huron.....	Micropterus salmoides.
John Demon.....	Pomoxis annularis.
Jug-mouth—North Carolina.....	Chenobryttus gulosus.
Jumper—Southern States.....	Micropterus salmoides et dolomieu.
Kiver—New Hampshire.....	Lepomis auitus.
Kiver—Maine.....	Eupomotis gibbosus.
Lake bass—Ohio.....	Ambloplites rupestris.
Lake bass—Ohio.....	Micropterus salmoides.
Lake bass—Great Lakes.....	Pomoxis sparoides.
Lake crappie—Great Lakes.....	Pomoxis sparoides.
Lake Erie bass—Pennsylvania; Ohio.....	Pomoxis sparoides.
Lake Huron black bass.....	Micropterus salmoides.
Lamp-lighter—Ohio.....	Pomoxis sparoides.
Large-finned bass.....	Centrarchus macropterus.
Large-mouthed bass—General.....	Micropterus salmoides.
Large-mouthed black bass—General.....	Micropterus salmoides.
Large-scaled sunfish.....	Lepomis megalotis.
Leather car—North Carolina.....	Lepomis auitus.
Leather wing—North Carolina.....	Lepomis auitus.
Little bass—Ohio Valley.....	Micropterus dolomieu (young).
Little bream.....	Enneacanthus obesus.
Little red-eye.....	Lepomis cyanellus.
Little sunfish.....	Enneacanthus.
Long-eared sunfish.....	Lepomis megalotis.
Long-eared sunfish.....	Lepomis auitus.
Long-finned sunfish.....	Centrarchus macropterus.
Many-spined sunfish.....	Centrarchus macropterus.
Marsh bass—Ohio.....	Micropterus salmoides.
Mill pond chub—Virginia.....	Micropterus salmoides.
Mill pond flier—North Carolina.....	Pomoxis sparoides.
Mill pond perch—North Carolina.....	Centrarchus macropterus.
Minnie bass—Ohio Valley.....	Micropterus dolomieu (young).
*More-mouth bream—South Carolina.....	Chenobryttus gulosus.
Moss bass—Indiana.....	Micropterus salmoides.
Mountain trout—Alabama.....	Micropterus dolomieu.
Mud bass—Indiana.....	Micropterus salmoides.
Mud bass.....	Acantharchus pomotis.
Mud chub—North Carolina.....	Chenobryttus gulosus.
Mud perch—North Carolina.....	Acantharchus pomotis.
Mud sunfish.....	Acantharchus pomotis.
New light—Kentucky.....	Pomoxis sparoides?
New light—Ky; Ind.; Ill.....	Pomoxis annularis.
Northern crappie.....	Pomoxis sparoides.
Northern pomotis.....	Eupomotis gibbosus.
Obscure fresh-water bass.....	Micropterus dolomieu.
Orange-spotted sunfish.....	Lepomis humilis.
Oswego bass—Great Lakes; New York.....	Micropterus salmoides.
Painted-tail—Ohio.....	Micropterus salmoides.
Pale crappie—Illinois.....	Pomoxis annularis.
Pale river-bass.....	Micropterus salmoides.
Pallid sunfish.....	Eupomotis pallidus.
Paper-mouth—Indiana.....	Pomoxis annularis.
*Pearch or pearch—Southern States.....	Lepomis, Eupomotis, etc.
Perch—General.....	Centrarchus macropterus.
Perch.....	Centrarchus macropterus.
Perch—Southern States.....	Micropterus salmoides et dolomieu.
Perch—Southern States.....	Chenobryttus gulosus.
Perch—California.....	Archoplites interruptus.
Perch-mouth bream—Florida.....	Chenobryttus gulosus.
Pond perch.....	Eupomotis gibbosus.
Pond perch—Ohio.....	Micropterus salmoides.
Pumpkin seed—New England & Middle States.....	Eupomotis gibbosus.
Quiver—Maine.....	Lepomis auitus.
Quiver—Maine.....	Eupomotis gibbosus.
Razor-back.....	Pomoxis sparoides.
Red-bellied bream—North Carolina.....	Lepomis auitus.
Red-bellied bream.....	Lepomis megalotis.
Red-bellied perch—South Atlantic States.....	Lepomis auitus.
Red-bellied perch—Georgia.....	Lepomis megalotis.
Red-bellied rosin perch—North Carolina.....	Lepomis auitus.
Red-belly—North Carolina.....	Lepomis auitus.
Red-belly—North Carolina.....	Eupomotis gibbosus.
Red-belly—Ohio Valley.....	Lepomis megalotis.
Red breast.....	Lepomis auitus.
Red-eye—General.....	Ambloplites rupestris.
Red-eye—General.....	Chenobryttus gulosus.
Red-eye—Illinois.....	Lepomis cyanellus.
Red-eye—North Carolina.....	Micropterus dolomieu.
Red-eyed bream—South Atlantic States.....	Ambloplites rupestris.
Red-eyed bream—Iowa; Arkansas; Ohio.....	Chenobryttus gulosus.
Red-eyed perch—General.....	Ambloplites rupestris.
Red-eyed sunfish.....	Lepomis megalotis.
Red-eyed sunfish.....	Ambloplites rupestris.
Red-headed bream—Pennsylvania.....	Lepomis auitus.
Red perch—Texas.....	Lepomis miniatus.
Red perch—Georgia.....	Lepomis auitus.
Red-spotted sunfish—Miss.; Ark.; Iowa.....	Lepomis humilis.
Red sunfish—Maine.....	Lepomis auitus.
Red-tailed bream.....	Lepomis auitus.
Red-tailed pomotis.....	Lepomis auitus.
River bass.....	Micropterus salmoides.
River bass.....	Micropterus dolomieu.
River crappie—Illinois.....	Pomoxis annularis.
Roach—Maine.....	Lepomis auitus.

Roach—Ohio; Maine.....	Eupomotis gibbosus.
Roach—Ohio.....	Pomoxis sparoides.
Robin—North Carolina.....	Lepomis auitus.
Robin—North Carolina.....	Eupomotis gibbosus.
Robin perch—North Carolina.....	Lepomis auitus.
Robin perch—Virginia; North Carolina.....	Eupomotis gibbosus.
Rock bass—General.....	Ambloplites rupestris.
Rock bass.....	Micropterus sp.
Round bass.....	Pomoxis sparoides.
Round sunfish.....	Centrarchus.
Round sunfish.....	Centrarchus macropterus.
Ruff—Massachusetts.....	Eupomotis gibbosus.
Sac-a-lait (lai)—Lower Miss. Valley.....	Pomoxis annularis.
Sac-a-lait—Louisiana.....	Chenobryttus gulosus?
Sac-a-lait—Louisiana.....	Centrarchus macropterus?
Sac-a-lait—Texas.....	Pomoxis sparoides.
Sac-a-lait—Texas.....	Pomoxis annularis.
Sacramento perch.....	Archoplites interruptus.
Salmon-formed growler.....	Micropterus salmoides.
Sand perch—North Carolina.....	Eupomotis gibbosus.
Sand perch.....	Pomoxis sparoides.
Shad.....	Pomoxis annularis.
Shell-cracker—Florida.....	Eupomotis holbrooki.
Shining bass.....	Centrarchus macropterus.
Silver bass—Illinois.....	Pomoxis sparoides.
Silver perch—Ohio Valley.....	Pomoxis annularis.
Silver perch—North Carolina.....	Pomoxis sparoides.
Slough bass.....	Micropterus salmoides.
Small green sunfish.....	Lepomis megalotis.
Small-mouthed black bass—General.....	Micropterus dolomieu.
Small-mouthed black bass—General.....	Micropterus salmoides.
Southern chub.....	Micropterus salmoides.
Southern crappie.....	Pomoxis annularis.
Speckled bass—Michigan.....	Pomoxis sparoides.
Speckled hen—Canada.....	Micropterus sp.
Speckled perch—N. C.; Fla.; Ark.; Ga.....	Pomoxis sparoides.
Speckled perch.....	Pomoxis annularis.
Spotted bass.....	Micropterus sp.
Spotted bream.....	Lepomis punctatus.
Spotted perch—Florida.....	Pomoxis sparoides.
Spotted river bass.....	Micropterus dolomieu.
Spotted trout—Georgia.....	Pomoxis sparoides.
Straw bass—Michigan; Indiana.....	Micropterus salmoides.
Straw bass—Ohio.....	Pomoxis sparoides.
Strawberry bass—General.....	Pomoxis sparoides.
Strawberry perch.....	Pomoxis sparoides et annularis.
Streaked cheeks river bass.....	Micropterus dolomieu.
Streaked head—Ohio Valley.....	Micropterus dolomieu.
Striped bass—Chautauqua Lake, N. Y.....	Micropterus salmoides.
*Suckley perch—Louisiana.....	Pomoxis annularis.
Sun bass—New York.....	Eupomotis gibbosus.
Sunfish.....	Ambloplites rupestris.
Sunfish—North Carolina; So. States.....	Centrarchus macropterus.
Sunfish.....	Chenobryttus gulosus.
Sunfish—General.....	Lepomis, Eupomotis, etc.
Sunfish—bass—Kentucky River.....	Ambloplites rupestris.
Sunfish river bass.....	Ambloplites rupestris.
Sunny—New York; New England.....	Eupomotis gibbosus.
Sun perch—Mississippi.....	Lepomis megalotis.
Sun perch—Tennessee.....	Ambloplites rupestris.
Sun perch—Pennsylvania.....	Lepomis auitus.
Sun perch—Georgia.....	Pomoxis sparoides.
Sun trout—Georgia.....	Chenobryttus gulosus.
*Swago—New York; Vermont.....	Micropterus dolomieu.
Swago bass—New York; Vermont.....	Micropterus dolomieu.
Swago—New York; Vermont.....	Micropterus dolomieu.
Swago bass—New York; Vermont.....	Micropterus dolomieu.
Timber croppie.....	Pomoxis annularis.
Tin-mouth—Illinois.....	Pomoxis sparoides.
Tin-mouth—Ohio Valley; Indiana.....	Pomoxis annularis.
Tin perch.....	Pomoxis annularis.
Tobacco box—Md.; Va.; D. C.....	Eupomotis gibbosus.
Trout—Southern States.....	Micropterus salmoides et dolomieu.
Trout bass—Ohio Valley.....	Micropterus dolomieu.
Trout perch—Ohio Valley; So. States.....	Micropterus dolomieu.
Trout river bass.....	Micropterus dolomieu.
*Warm-mouth perch—Georgia.....	Chenobryttus gulosus.
Warmouth—General.....	Chenobryttus gulosus.
Warmouth bream—Florida.....	Chenobryttus gulosus.
Warmouth perch—S. C.; Ga.; Fla.....	Chenobryttus gulosus.
Welshman—North Carolina; Virginia.....	Micropterus salmoides.
White bass.....	Micropterus salmoides.
White bass—Ohio Valley.....	Ambloplites rupestris.
White croppie.....	Pomoxis annularis.
White perch—Ohio River.....	Pomoxis annularis.
White perch—Georgia.....	Pomoxis sparoides.
*White salmon—Virginia.....	Micropterus salmoides.
White trout—Mississippi.....	Micropterus salmoides.
White trout—Ohio Valley.....	Micropterus dolomieu.
White-mouth sunfish.....	Chenobryttus gulosus.
Yellow bass—Ohio Valley.....	Micropterus dolomieu.
Yellow bass—Ohio Valley.....	Micropterus salmoides.
Yellow-belly—Virginia; North Carolina.....	Lepomis auitus.
Yellow-belly—North Carolina.....	Eupomotis gibbosus.
Yellow bream.....	Lepomis holbrooki.
Yellow perch—Maine; Georgia.....	Lepomis auitus.
Yellow perch—Maine.....	Eupomotis gibbosus.
Yellow perch—Ohio Valley.....	Micropterus dolomieu.
Yellow pond perch.....	Micropterus salmoides.

Systematic List of the Bases and Sunfishes, with the Common Names Applied to Each Species Shown Thereunder.*

1. <i>Pomoxis sparoides</i> (Lacépède). Strawberry Bass; Calico Bass:	Bachelor, bank-lick bass, bar-fish, bitter-head, black crappie, calico bass, calico bream, campbellite (?), chinquapin perch, crappet, crappet calicot, crappie, crappie, Dolly Varden, goggle-eye, goggle-eyed perch, grass bass, lake bass, lake crappie, Lake Erie bass, lamp-lighter, mill-pond flier, new light (?), Northern crappie, razor-back, roach, rock-fish, sac-a-lait, sand perch, silver bass, silver perch, speckled bass, speckled perch, spotted perch, spotted trout, straw bass, strawberry bass, strawberry perch, sun perch, tin-mouth, white perch.
2. <i>Pomoxis annularis</i> Rafinesque. Crappie:	Bachelor, bachelor perch, bridge perch, calico bass (?), campbellite, chinquapin perch, crappet, crappie, crappie, goggle-eye, gold-ring, gold-ring pomoxis, John Demon, new light, pale crappie, paper-mouth, river crappie, sac-a-lait, shad, silver perch, Southern crappie, speckled perch, strawberry perch, suckley perch, timber croppie, tin-mouth, tin perch, white crappie, white perch.
3. <i>Centrarchus macropterus</i> (Lacépède). Flier; Round Sunfish:	Flier (or flyer), flying perch, large-finned bass, long-finned sunfish, many-spined sunfish, mill-pond perch, perch, round bass, round sunfish, sac-a-lait, shining bass, sunfish.
4. <i>Acantharchus pomotis</i> (Baird). Mud Sunfish:	Bass sunfish, mud bass, mud perch, mud sunfish.
5. <i>Ambloplites rupestris</i> (Rafinesque). Rock Bass:	Black sunfish, bream (brim), brème, bronzed centrarchus, crappet mondoux, crappet noir, crappet vert, croppie, fresh-water bass, goggle-eye, goggle-eyed bass, lake bass, red-eye, red-eyed bream, red-eyed perch, red-eyed sunfish, rock bass, sunfish, sunfish bass, sunfish river bass, sun perch, white bass.
6. <i>Archoplites interruptus</i> (Girard). Sacramento Perch:	Perch, Sacramento perch.
7. <i>Chenobryttus gulosus</i> (Cuvier & Valenciennes). Warmouth:	Big-mouth, big-mouthed sun-fish, black sunfish, black warmouth, bream, buffalo bass, chub, goggle-eye, jug-mouth, more-mouth bream, mud chub, perch, perch-mouth bream, red-eye, red-eyed bream, sac-a-lait, sunfish, sun trout, warm-mouth perch, warm-mouth, warmouth bream, warmouth perch, wide-mouthed sunfish, yaw-mouth perch.
8. <i>Enneacanthus obesus</i> (Baird).	Banded sunfish, little bream, little sunfish.

*There are eight or ten other species of sunfishes to which no common names have been given.

9. <i>Enneacanthus gloriosus</i> (Holbrook).	Blue-spotted sunfish, little sunfish.
10. <i>Mesogonistius chatodon</i> (Baird). Banded Sunfish:	Banded sunfish, black-banded sunfish.
11. <i>Apomotis punctatus</i> (Cuvier & Valenciennes). Chinquapin Perch:	Bream (brim), chinquapin perch, spotted bream.
12. <i>Apomotis cyanellus</i> (Rafinesque). Green Sunfish:	Black-eyes, black-eye sunfish, blue-and-green sunfish, blue bass, bluefish, blue sunfish, blue-spotted sunfish, bream (brim), buffalo sunfish, green sunfish, little red-eye, perch, perch or peech, red-eye, sunfish.
13. <i>Apomotis ischyrys</i> (Jordan & Nelson):	Big-nosed sunfish.
14. <i>Lepomis auitus</i> (Linnaeus):	Black-eared pond fish, bream (brim), flat fish, flounder, fresh-water sunfish, goggle-eyed perch (?), kiver, leather-ear, leather-wing, long-eared sunfish, perch, perch or peech, quiver, red-belly, red-bellied bream, red-bellied perch, red-bellied rosin perch, red-breast, red-headed bream, red perch, red sunfish, red-tailed bream, red-tailed pomotis, roach, rosin, rosin perch, sunfish, sun perch, yellow-belly, yellow perch.
15. <i>Lepomis miniatus</i> Jordan:	Red perch.
16. <i>Lepomis megalotis</i> (Rafinesque). Long-eared Sunfish:	Big-ear sunfish, black-ears, black-tailed sunfish, bloody sunfish, bream (brim), brilliant sunfish, common sunfish, eared sunfish, large-scaled sunfish, long-eared sunfish, perch, perch, or peech, red-bellied bream, red-belly, red-eyed sunfish, small green sunfish, sunfish, sun perch.
17. <i>Lepomis humilis</i> (Girard). Red-spotted Sunfish:	Bream (brim), orange-spotted sunfish, perch, perch or peech, red-spotted sunfish, sunfish.
18. <i>Lepomis macrocheirus</i> Rafinesque:	Bream (brim), chain-sided sunfish, chain-side, gilded sunfish, goldfish, perch, perch or peech, sunfish.
19. <i>Lepomis pallidus</i> (Mitchell). Blue-gill; Blue Sunfish:	Black-eared pond-fish, blue bream, blue-gill (or blue-gills), blue-gilled bream, blue joe, blue-mouthed sunfish, blue perch, blue sunfish, bream (brim), copper-headed bream, copper-nosed bream, dollardee, perch, perch, perch, perch.
20. <i>Eupomotis gibbosus</i> (Linnaeus). Pumpkin-seed; Tobacco-box:	Bream (brim), chub rosin (?), common sunfish, crappet jaune, female perch, flatfish, flounder, fresh-water perch, harlequin roach, kiver, Northern pomotis, perch, perch, perch, pond perch, pumpkin-seed, quiver, red-belly, roach rosin, rosin-perch, ruff, sand perch, sun bass, sunfish, sunny, tobacco-box, yellow-belly, yellow perch.
21. <i>Eupomotis holbrooki</i> (Cuvier & Valenciennes):	Yellow bream, shell-cracker.
22. <i>Micropterus salmoides</i> (Lacépède). Large-mouthed Black Bass:	Achigan, Achigan grande bouche, Achigan noir, bass, bayou bass, big-mouthed bass, big-mouthed black bass, big-mouthed trout, black bass of the Huron, black-Huron, bride perch, chub, common bass, cow bass, dotted painted-tail, fresh-water trout, grass bass, gray bass, green bass, green perch, green trout, growler, Huron, jumper, lake bass, Lake Huron black bass, large-mouthed bass, large-mouthed black bass, marsh bass, mill-pond chub, moss bass, mud bass, Oswego bass, painted-tail, pale river-bass, perch, pond perch, river bass, rock bass, salmon-formed growler, slough bass, Southern chub, speckled hen, spotted bass, straw bass, striped bass, trout, Welshman, white bass, white salmon, white trout, yellow bass, yellow pond perch.
23. <i>Micropterus dolomieu</i> Lacépède. Small-mouthed Black Bass:	Achigan, Achigan noir, Achigan petite bouche, bass, bass hog-fish, black bass, black fresh-water bass, black perch, bronze-backer, brown bass, brown river bass, brown trout, dwarf bass, gold bass, green bass, green perch, green trout, hog bass, jumper, little bass, minny bass, mountain trout, obscure fresh-water bass, perch, red-eye, river bass, rock bass, small-mouthed bass, small-mouthed black bass, speckled hen, spotted bass, spotted river bass, streaked-cheeks river bass, streaked-head, Swago, Swago bass, Swago, Swago bass, trout, trout bass, trout perch, trout river-bass, white trout, yellow bass, yellow perch.

The Lobster Situation.

Boston, Sept. 26.—*Editor Forest and Stream:* The convention of commissioners called in accordance with a resolve passed last winter by the Massachusetts Legislature with a view to securing uniform laws for protection of lobsters, convened at the State House on Wednesday last, and the attendance must have been very gratifying to Captain Collins, who was chosen to preside. Dr. George W. Field was chosen secretary. Maine was represented by A. R. Nickerson, commissioner of sea and shore fisheries; New Hampshire by Commissioners Wentworth and Clark; Massachusetts by the three commissioners; Rhode Island by President Henry T. Root, Vice-President J. M. K. Southwick, Secretary W. P. Morton and Messrs. C. W. Willard, W. H. Boardman and Deputy E. W. Kelly. Connecticut sent Chairman G. T. Mathewson and E. H. Greer, of the commission, also Messrs. F. W. Morgan and E. H. Potter, representing the "Fishermen's Association" of the State. From the Provinces came Mr. R. N. Venning, assistant commissioner of fisheries at Ottawa, and Mr. A. C. Bertram, inspector of fisheries for the Island of Cape Breton, N. S. New York sent Fish Commissioner B. Frank Woods, and the Massachusetts Fish and Game Protective Association was represented by President Reed and the secretary.

In opening the meeting Chairman Collins, on behalf of the State, extended a cordial welcome to all those in attendance and expressed profound satisfaction with the spirit which had prompted the delegates to attend. He said: "All that has been done so far by legal enactment or otherwise has failed to stay the decadence in the supply of lobsters. We must decide whether to let present conditions continue or take such action as will perpetuate the industry by insuring proper protection of the lobster."

During the forenoon session of Wednesday Commissioner Root, of Rhode Island, spoke at length of the work of propagation in his State, and was accorded the closest attention by those present.

Egg-bearing lobsters had been purchased and impounded until ready to deposit their eggs. He announced the opinion that their plan had solved the problem of the artificial propagation of lobsters. An essential part of the plan, he said, was to keep the young ones in constant motion to prevent them from

fighting among themselves, as even the very small ones are exceedingly pugnacious. They had used a fan, propelled by an electric motor. This year 1,000,000 lobsters have been liberated by his commission. This work has greatly interested the fishermen and helped to win them over to an observance of the laws.

Deputy Kelly said that thousands and thousands of short lobsters had been brought over from Massachusetts to Rhode Island, 90 per cent. of them still alive, and when seized had been thrown overboard. He wants egg-bearing lobsters held over through the winter until they are ready to deposit their eggs. Two sessions were held on Wednesday and two on Thursday, and I think every man present had something interesting to say. Messrs. Venning and Bertram gave a very full and clear account of the work done in Provincial waters in the line of propagation as well as in restricting the catch, the most important feature being the close time, which varies in its period in different sections. A fuller account of their reports and observations may be the subject of another letter. Great stress was laid by several speakers upon the protection of the egg-bearing lobster, and Dr. Field spoke in favor of allowing 8½ and 9-inch lobsters to be caught and the prohibiting of the catch of the 10 and 11-inch ones.

President Reed spoke of the difficulty in enforcing the present law, speaking from the standpoint of prosecuting attorney. The shorts could be easily purchased and consumed by shore houses and cheap hotels by men who were willing to break the law. He recommended a close time during two of the summer months.

Mr. Nickerson said the shore people in Maine would oppose such a law and would surely cause its defeat if an attempt were made to pass it.

Those who spoke for Rhode Island and Connecticut expressed the opinion that their fisheries were holding their own at present, but Connecticut had no statistics whatever as to the catch, number of fishermen or of pots in use. Statistics presented from Rhode Island showed nothing as to the catch in Rhode Island waters. A committee of these gentlemen appointed on Thursday made these recommendations:

1. A law limiting the catching to men having permits from the State—penalty \$100 and revocation of permit for a year if found violating the laws.

2. Recommending, if possible, a uniform legalized length in the New England States and New York.

3. The adoption of law now in force in Maine as to sale of lobster meat not contained in the shell.

Some propositions made by Dr. Field and a report of discussions at the dinner on Thursday evening must be deferred to another time.

National Beagle Club.

CAMDEN, N. J.—At a recent meeting of the National Beagle Club of America, it was decided that the Fourteenth Annual Trials of the club, which will commence on November 9, 1903, be held at Howardsville, Albemarle county, Virginia.

Howardsville is between Richmond and Lynchburg, distant from Richmond about ninety miles. Full details and information concerning these trials will be given through the sporting papers from time to time, or upon application to the secretary of the club.

CHAS. R. STEVENSON, Secretary.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18 ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

The Camp at Sugar Island.

THE twenty-fourth annual camp of the American Canoe Association was held this year, for the first time in its history, upon its own property—Sugar Island, in the St. Lawrence, nearly midway between Clayton, N. Y., and Gananoque, Can., and just over the Canadian border line, from Aug. 7 to 21.

It was the generally expressed opinion at the close of camp that it was, if not the best, one of the very best in the history of the A. C. A. Several factors contributed to this decision: In the first place, while the camp entailed much hard work on the part of the officers, committees, and members at large, it was felt that all work done in the way of clearing camp sites, underbrushing, cutting trails through the "forest primeval," etc., was in the nature of a betterment to the island, and not work done for merely one camp of two weeks. In the second place, the camp awakened a decided interest in a number of the older members of the Association, who have seen, for years, the folly of going from one new place to another, constantly involving new expenses and trouble, only to be followed by similar experiences the next summer. Now that Sugar Island has been made a permanent home for the A. C. A., the members can rest a spell and enjoy the natural advantages of their own possession before beginning new ventures after untried camp sites.

The island is the most picturesque anywhere in the St. Lawrence River, for its size; it abounds in white birch and endless varieties of evergreens, firs, balsams, and cedars, and plenty of clumps of ash and hickory trees; it is so diversified that members can camp absolutely out of hearing of any other camp, and enjoy as much privacy as though they were the sole tenants. The shore is beautifully indented with numberless little bays and coves, not only adding to the appearance of the island, but furnishing any number of ideal camps, where small docks can be built, and above which tents can be pitched. There are two or more fine sand beaches, and very few spots where the ground is at all low or oozy. The constant sight of loons, owls, and other wild birds of the smaller varieties; of squirrels and woodchucks, not to mention other furry denizens, proves the island to be in a virgin state, and adds much to its charm as a camp. The water is admirably adapted for paddling and sailing courses; it is very deep in many places close to shore, giving fine chances for diving, as well as enabling boats of deep draft to come up to the dock at headquarters.

The camp was not large, but it was most homogeneous, and enthusiastic. Every one who attended, from the oldtimers of the early '80s, to the novices of '03, left with the resolution to return next year, each one with more of his club mates and friends.

Sugar Island is bound to make canoe paddling the principal feature of its camps. The wilderness of the island, and the facility for getting lost on some of the rocky trails at night, rendered the use of canoes absolutely necessary. Many "campers"—for the first time—were obliged to enlist the services of a canoe, and the result was that the shore, and surrounding bays and inlets were dotted with canoes and skiffs at all hours. Far around on the south shore, and away from headquarters were the sailors from Winchester, with Herman Dudley Murphy's latest novice, a paddler, for a change. Still further were the Duquesnes from Pittsburgh, ever hospitable, and beyond them the Grand Trunk men from Montreal, with a fleet of a dozen or more canoes and big tents. Nearer by were the Eastern men from Innitou and Medford; the Knickerbockers from New York, as usual, following the traditions of their ancestors in '84, '85 and '86, secured the most picturesque camp in the island, and kept up their repu-

tation for entertaining, as well as racing. Nearer still to headquarters was New York Bay, with that club on one side and Irondequoit Park on the other—the lair of the Rochester and Irondequoit men, with Deowainsta's sole representative perched on top of the hill back of camp; but even the hill was not snore-proof! To the western end of the island was the Mecca of all good boys, Squaw Point, where Mrs. Leigh, from Toronto, the "Doyenne"—if such a word may be coined—of the ladies; Mrs. Jack MacKendrick, Mrs. Quick from Yonkers, and other "squaws" provided comfortable seats, and tea and other good things for the wearied canoeist, after a day's racing or underbrushing or general work around the camp.

The camp site committee was untiring in looking after new arrivals, pitching tents, handling baggage, cots, etc. No better committee has been in charge for years, and all credit is due to its chairman, J. S. Wright, of Rochester, N. Y.

The mess was good; the location of the mess tent admirable—a permanent floor, with kitchen, etc., having been built well away from the main camp and Squaw Point. The camp store was the best that the members of the A. C. A. have ever had, although its location was a bit too obtrusive. And the ice-house gave unbounded satisfaction. These buildings are the only permanent structures to be erected on the island, the universal sentiment being in favor of leaving everything as natural and untouched as it is possible to do.

Transportation was excellent—daily trips twice each way to and from Clayton and Gananoque, as well as a launch to the latter point.

The weather was unsatisfactory, unseasonably cold and windy the first week, and hot, with calms and squalls the second week. The old reliable St. Lawrence seemed to have changed about this year, and no predictions could be made of a day, an hour in advance. As a result, many of the races had to be postponed; one or two were not called at all, and the regatta as a whole was rather unsatisfactory. Six sailing canoes of the racing type were the turnout, in contrast to the fleets of thirty and forty in the old days; but it is hoped that the interest awakened this year will help to improve things. The sailing and paddling courses, directly in front of headquarters, left nothing to be desired, and met the approval of all the racing men.

Great credit is due Com. Hyatt and Sec'y-Treas. Quick; the former, in spite of a long and serious illness, was at camp during several weeks prior to its opening, looking after things, and during camp, by his never-failing good spirits and geniality made headquarters row one of the most popular spots in camp. The latter, who took over the office on the death of Louis Simpson, in spite of many handicaps sufficient to discourage a less ardent member of the A. C. A., won the approval and thanks of all the camp, and deserves a heap of credit for his labors before and during camp.

A pleasant feature of the camp was the presence of so many of the "old guard," ex-Com. Edwards from Peterboro, Com. Gardner from Cleveland, Dr. Gersster from New York, Major and Mrs. Leigh from Toronto—these and many others proved by their presence that the stamina of the A. C. A. is stronger than it ever was before, and only needed the judicial selection of a camp site to justify it. Next year will see a turnout to rival Jessup's Neck in '90!

The choice of the general officers for 1904 will meet with universal approval from all sections of all divisions: C. Fred Wolters, A. C. A. No. 798, for Commodore, and John S. Wright, A. C. A. No. 2779—newer, but no less popular—for Secretary-Treasurer, would be hard to equal and could not be beaten. With these men at the helm, with Sugar Island picked out for the camp in 1904, probably from Aug. 5 to 19, with a general realization on the part of the members of the A. C. A. of the treasure they possess in Sugar Island, and with an equal amount of energy and enthusiasm, on the part of the committees and members, to that of the camp just closed, the American Canoe Association—now in its twenty-fifth year—may rest secure in the unwaning popularity of the truest sport and recreation, canoeing. 464.

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 24, 1903.

C. F. WOLTERS,

Commodore-Elect.

JOHN S. WRIGHT, Sec'y-Treas.

Canoe Song.

Silent we leave the island shore,
To watch the dancing moonbeams gleam
Upon the water's polished floor;
To sing, to drift, to dream.

The moon is like a fairy ship
That steers her course across the sky.
'Twixt island clouds she seems to slip,
Then softly passes by.

The stars are lights to steer her by,
Stationed on rock or hidden sand,
Or placed perhaps on towers high
That rise from unseen land.

Then back we drift to camp and light;
To merry friends and great good cheer;
Yet we are loath to leave the night,
And all its wonders here.

JOSEPH MASON, JR.

Brooklyn C. C.

GRAVESEND BAY, LONG ISLAND,
Saturday, Sept. 19.

THE annual fall regatta of the Brooklyn C. C. was held off the club house on Gravesend Bay on Saturday afternoon, Sept. 19. The lack of wind prevented as exciting sailing races as would otherwise have been held. The Messrs. W. A. and F. G. Furman, of the P. I. C. A., Trenton, N. J., and J. K. Hand, of New York, were among the canoeists present.

Event No. 1, decked sailing canoe race, 5 miles, triangular course; tide flood; wind light from N.E.: First, M. M. Davis, canoe Clover; second, P. F. Hogan, Unqua; third Walter N. Stanley, Eclipse.

Event No. 2, open canoe sailing race, 3 miles; also open canoe sailing race for the Pagan trophy, over the same course; conditions as above: H. A. Reitzenstein, Mushquash, first in open canoe race; A. W. Walter, Eonac, second in open canoe sailing race and first in Pagan trophy race; J. B. Taylor, Redskin, third in open canoe sailing race; T. O. Brown, —, second in Pagan trophy race.

Event No. 3, tandem, single-blade, paddling race, 1-3 mile: First, W. A. and F. G. Furman; second, T. O. Brown and W. N. Stanley; third, H. A. Reitzenstein and A. W. Walter. Start, 5:55:38 P. M. Finish, 5:58:09. Winners' time, 2m. 31s.

Event No. 4, one-man, single blade paddling race, 1-3 mile: First, H. A. Reitzenstein, Mushquash; second, W. N. Stanley, —; third, W. A. Furman, —. Start, 6:15:20 P. M. Finish, 6:17:59. Winner's time, 2m. 39s.

The mileage record of the Brooklyn C. C. for 1903 was awarded to W. N. Stanley, with a total of 362½ miles to his credit, made principally on the Upper Passaic, Pompton Lakes, Hopatcong, the Delaware, etc.

Yonkers C. C.

GLENWOOD, HUDSON RIVER,
Saturday, Sept. 26.

The Yonkers C. C. held a most successful regatta on Saturday afternoon, Sept. 26, off the club house, at Glenwood, Yonkers. Results:

Event No. 1—Tandem paddling open canoes, single blades, 3 P. M. First, E. Howe Stockwell and G. H. King, Knickerbocker C. C.; second, T. Hale, Jr., and A. Reese, Yonkers C. C.; third, J. E. Taylor and W. G. Harrison, Knickerbocker C. C.; fourth, H. Lansing Quick and R. Edgar, Yonkers C. C.; fifth, G. Reese and Norman Taylor, Yonkers C. C.

Event No. 2—One-man, open canoe paddling, single blade, 3:30 P. M. First, G. H. King, Knickerbocker C. C.; second, H. L. Quick, Yonkers C. C.; third, Thomas Hale, Jr., Yonkers C. C.

Event No. 3—Tail-end race. Won by G. H. King, the only one of the contestants who managed to remain in his canoe right side up; all the others capsizing before crossing the line. Strong S. wind against strong ebb tide.

Event No. 4—Fours paddling, open canoe, single blades, 4:30 P. M. First, E. M. Underhill, W. Schulz, G. Reese, Norman Taylor, Yonkers C. C.; second, R. Edgar, A. Reese, T. Hale, Jr., H. L. Quick, Yonkers C. C.; third, Hinck, King, Barden, Lohr, scrub team, Hiawatha C. C.

Event No. 5—Tilting tournament. First bout, H. L. Quick and R. Edgar beat G. Reese and N. Taylor; second bout, G. H. King and W. G. Harrison, Knickerbocker C. C., beat W. R. Schulz and E. M. Underhill, Yonkers C. C.; third bout, King and Harrison beat Quick and Underhill.

The regatta was held jointly with the races of the Palisade B. C.; after the races a smoker was given at the shore house of the Palisade B. C., where lunch was served, prizes presented, and a general good time enjoyed by the members of the two clubs and their friends from Yonkers and out of town.

Knickerbocker C. C.

ANNUAL CAMP AND REGATTA OF THE KNICKERBOCKER
CANOE CLUB, HELD AT ARDSLEY-ON-HUDSON, N. Y.,
SEPT. 5, 6, AND 7, 1903.

Sailing race, about 1-1½ miles, from buoy off camp to and around yacht Aileen; beat to windward; twice around course. Wind N. by W. and puffy; tide strong ebb; weather clear.

85 sq.ft. Sail Area or Under—Start, 4:55.
Over the Line. First Round. Finish
Foggy Dew, R. H. Kretzmer.....4 55 58 5 21 28 5 59 12
Chiquita, M. Ohlmeyer, Jr.....4 55 35 5 23 48 6 00 20
Papoose, L. C. Kretzmer.....4 55 47 5 20 28 6 02 05
Canuck, W. G. Harrison.....4 56 07 5 28 12 Withdrew

Prize offered by Audubon Y. C., won by R. H. Kretzmer.
65 sq.ft. Sail Area or Under—Start, 4:55.
Tot, Wilbur D. Andrews.....4 55 40 5 23 16 6 07 09
Yankee, J. E. Taylor.....4 55 46 5 28 41 Withdrew
Mudjkeewis, C. Moore.....4 55 52 5 30 35 Withdrew

Nahma, B. F. Cromwell, Jr.....4 56 58 Withdrew

Prize offered by Audubon Y. C. Won by W. D. Andrews.
Tandem paddling race, double blades, about ½ mile with turn. Weather conditions as above. Start, 6:31:00.

Finish.
G. L. Roberts, Jr., and W. G. Harrison.....6 35 50
L. Reichert and R. H. Kretzmer.....6 36 22
F. P. Keller and B. F. Cromwell, Jr.....6 36 00
C. F. Boell and M. Ohlmeyer, Jr.....6 36 45

Keller and Cromwell finished ahead of Reichert and Kretzmer, but second place was awarded the latter crew on account of foul at stakeboat.

One-man, double-blade, decked canoes, paddling race, about ½ mile straightaway, finishing off camp. Start, 10:43:50.

Finish.
G. L. Roberts, Jr.....10 48 45
W. G. Harrison.....10 48 47
Fred P. Keller.....10 48 57

Weather clear; tide flood; sea smooth.
Tandem, single blades, about ½ mile. Weather conditions as above. Start, 12:12:50.

Finish.
C. F. Boell and G. L. Roberts, Jr.....12 16 14
W. G. Harrison and J. E. Taylor.....12 16 17
F. P. Keller and B. F. Cromwell, Jr.....12 16 27
R. H. Kretzmer and Louis Reichert.....Not timed.

Hurry-scurry race, 300yds., about; run, swim and paddle:
First, C. F. Boell; second, W. D. Andrews; third, M. Ohlmeyer, Jr.; fourth, W. G. Harrison; fifth, W. B. Jones; sixth, F. P. Keller; seventh, L. Reichert; eighth, Geo. E. Taylor.

Tilting tournament, 12:30. Weather clear; tide strong ebb; no wind.

First Bout.—F. P. Keller and B. F. Cromwell, Jr., won from L. Reichert and W. B. Jones.

Second Bout.—W. D. Andrews and W. G. Harrison won from C. F. Boell and M. Ohlmeyer, Jr.

Third Bout.—F. P. Keller and B. F. Cromwell, Jr., won from W. D. Andrews and W. G. Harrison.

Time, 13m. 25s.

Fours, paddling, open canoes, single blades. Weather conditions as above. Start, 1:40:30.

Finish.
Boell, Jones, Andrews and Roberts.....1 44 17
J. E. Taylor, Keller, Cromwell and Harrison.....1 44 22
Ohlmeyer, Reichert, R. H. Kretzmer and Scott.....1 44 46

Sailing race, triangular course, about ½ mile to a leg; twice around, making three miles. Called at 2 P. M. Weather clear; wind W.N.W. strong and puffy to light and calm. Strong ebb tide.

85 sq.ft. Sail Area or Under—Start, 2:21.
Over the Line. First Round. Finish
Papoose, L. C. Kretzmer.....2 21 22 2 40 42 2 59 55
Chiquita, M. Ohlmeyer, Jr.....2 21 42 Withdrew
Foggy Dew, R. H. Kretzmer.....2 21 25 2 43 10 Withdrew
Canuck, W. G. Harrison.....2 21 45 2 43 15 Withdrew

65 sq.ft. Sail Area or Under—Start, 2:31.
Tot, W. D. Andrews.....2 31 41 2 58 10 Withdrew
Yankee, J. E. Taylor.....2 31 30 2 56 30 Withdrew
Mudjkeewis, C. Moore.....2 31 40 2 58 20 Withdrew
Hobo, J. T. Farrelly.....2 31 50 2 58 25 Withdrew
Nahma, F. P. Keller.....2 32 14 Withdrew

The failure of the wind and the very strong tide prevented the finishing of the entire fleet of the 65ft. class, and the second man in the 85ft. class.

Sept. 13.—Off the club house. Wind S.E., heavy; tide flood; sea rough.
65 sq.ft. sail area class, postponed from Ardsley-on-Hudson, on account of lack of wind. Start, 1:48.

Over the Line. First Round. Finish
Tot, W. D. Andrews.....1 48 30 2 25 10 3 17 07
Yankee, J. E. Taylor.....1 49 00 2 40 05 3 34 40

A. C. A. Officers—Eastern Division.

The officers of the Eastern Division for 1904 are as follows: Vice-Com., Henri Schaeffer, Manchester, N. H.; Rear-Com., H. M. S. Aiken, 45 Milk Street, Boston, Mass.; Purser, Edw. B. Stearns, Manchester, N. H.; Executive Committee, B. F. Jacobs, Jr., West Medford, Mass.; D. S. Pratt, Jr., Wellesley Hills, Mass.; Marcus Butler, Lawrence, Mass.; W. W. Crosby, Woburn, Mass.

A. C. A. Membership.

The following names have been proposed for membership to the A. C. A.:

Robert Bonner, S. Willard Brigham, Providence, R. I.; B. E. Phillips, Boston, Mass.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

OCTOBER.

3. Seawanhaka Corinthian, club, Oyster Bay.
3. Columbia, special, Lake Michigan.
5. Southern, fall, New Orleans.
10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

PANHARD-LEVIASSOR have planned to establish a plant in the States for the building of motor boats and engines. M. Andre Massenet, president, and M. Andre Magnin, vice-president of the American department of the great French automobile company, have recently arrived in New York, and they will arrange the details for the new enterprise. At first the company will turn out boats of from 30 to 40 feet in length, equipped with gasoline motors of about ten horse-power. As soon as the plant is well under way, however, larger and more powerful boats will be built.

SHAMROCK I., Sir Thomas Lipton's first challenger for America's Cup, was purchased last week by Mr. George de Pinna, who was acting for Messrs. M. Samuels & Sons, of Brooklyn, dealers in old metals. The price paid for the boat is not known. It is stated that she will be converted into a schooner and used in carrying scrap iron between New York and South American ports. This report can hardly be credited, as the yacht is quite unsuitable for any such purpose, and it is likely that if she is not sold to some yachtsman who wishes to convert her into a cruising schooner or yawl, she will be broken up.

THE Royal St. Lawrence Y. C., of Montreal, Canada, has received four challenges for the Seawanhaka cup. The challenging clubs are the White Bear Y. C., of St. Paul, Minn.; Manchester Y. C., of Manchester, Mass.; Minnetonka Y. C., Minneapolis, Minn., and the Royal Portsmouth Corinthian Y. C., of Portsmouth, England. At a meeting of the Royal St. Lawrence Y. C. it was suggested that the boats representing the four challenging clubs hold races on Lake St. Louis and the winner of the series would meet the defender selected by the Royal St. Lawrence Y. C. This plan caused considerable feeling, and the commodore of the club, the Hon. Justice C. P. Davidson, vacated the chair, stating as he did so that such action was at variance with the conditions in the Seawanhaka cup deed of gift. The defense of the Seawanhaka cup has been such a sinecure for the Royal St. Lawrence men for years past that they would be sorry to see the cup lost, and the club's recent action shows that they are anxious to have the fastest possible boat meet the defender. The races for the Seawanhaka cup have been without interest for several years, as they have all been too one sided for anyone to work up much enthusiasm over them.

Greenport to the Virgin's Breasts.

The Days of a Happy Month, July 28 to Aug. 28, 1901.

BY B. H. W.

THIS is the record, as taken from the skipper's notebook, of a cruise in Altair from Greenport, N. Y., a distance as sailed of 1,140 nautical miles.

Altair is a keel yawl built strongly for outside work, 32ft. 9in. over all, 22ft. 5in. on the waterline, 8ft. 4in. beam, and 4ft. draft. Her ballast is lead, cast and bolted on the keel. She carries 608 sq.ft. of sail, and can be easily managed by one man in all weather. Her skipper has taken her over six thousand miles along the coast, and has never had occasion to regret the confidence he has placed in her seaworthiness.

"Now ho! for the joy of a moving ship!

And ho! for the white sails blowing wide!

And ho! for the salt wine on the lip,

And the rush of the mellow tide!

More faintly comes the breakers' boom,

And far arear the home lights slip,

And fast the thundering jetty-side

Runs back athwart the gloom."

—McNeal.

We were alongside the dock at Greenport. Our third man had disappointed us. We, whom you will know as the Admiral and the Skipper, had determined to go it alone, and were busily engaged in stowing our last odds and ends, when a well-built young fellow loitered down to the pier and made himself unostentatiously useful. He was evidently a gentleman, and after sizing him up for a time, during which we learned his name, his business, and various other things, we ended by asking him to be our guest.

5:20 P. M. found us in commission and sailing out by Greenport breakwater. All night we glided softly on, with a gently breathing air from starboard, a clear sky and gibbous moon. For hours Altair sailed her course with helm lashed. At dawn Point Jude and Block Island lights were broad off either bow, and we headed her E. ½ S. for the Vineyard. The wind grew gradually more fresh. The horizon thickened and clouded, with promise of a fresh gale; but we hung on to everything and ran on.

From Gay Head to Succunnetset we had a strong head tide, but a rapidly increasing wind. Soon after passing the light vessel, although the breeze was a point aft the beam, we were obliged to shorten sail, and having a free wind and only a short distance to go, we avoided a reef by dropping the peak of the mainsail, and at 4:30 ran behind Hyannis Breakwater out of a white and tumbling sea.

It was so "swelly," even behind the breakwater, that my crew could hardly manage a mouthful of dinner, so we got up jib and mizzen and moved up close behind the middle of the wall, where we could lie with less motion. Turned in at 8 P. M. and slept soundly, except for a time when a sharp thunder squall woke us up, until 8 A. M. There was then heavy rain, with a sharp northerly gale, and it looked very sloppy. We were all sore and stiff from our unaccustomed exertions in sailing the last thirty miles of our one hundred and five in a very fresh breeze and ugly chop, but after a swim and breakfast at 10 A. M., felt better. The Skipper stayed aboard and cleaned up some odds and ends of work while the others went ashore. Barometer steady all day at 29.81, after a fall of 4-10 of an inch yesterday. Night came in cloudy, with heavy banks to westward, and strong N. E. wind with rain and fog at intervals.

July 30 opened with rain, east wind and fog, but at 2 P. M. it lightened a bit, and wind went to S.W. fresh. Barometer 29.70. At 2:45 P. M. sailed for Monomoy, passing out through the beach channel. At 7:05 set log

CHART OF CRUISE MADE BY ALTAIR FROM GREENPORT TO THE VIRGIN'S BREASTS.

off Chatham whistle. Wind W. fresh; heavy cloud bank in W. and N.W. Passed Nausett, distance $1\frac{1}{2}$ miles, at 9:20. At 11:50 P. M. Highland light bore W. by S., distant 2 miles. Set course N.N.W. $\frac{1}{2}$ W. Clear moonlight, smooth sea, moderate west wind. Soon after this the wind fell, and we drifted until 5 A. M., when we lowered mainsail for a sharp squall. After this a calm continued until 12:35, when it breezed up a little and slipped us along at a 4-knot rate. Made a good landfall, and at 4:45 P. M. dropped our hook in Gloucester Harbor. Distance 95 knots.

As our tank water had a disagreeably foul odor and taste, we loosed the pipe coupling and let it out into the bilge; then cruised after the water boat, turned a strong stream into the tank and cleaned it thoroughly. Now we hope to have drinkable water.

At 9:15 A. M. of Aug. 1 we drifted lazily by Eastern Point, the rounded, woolly clouds over the land showing a strong N.W. wind, while over the sea was a gray veil and a light S.E. wind. Along the shore was a calm streak, and in this we were fated to stay for several hours until at noon the sea wind gained the ascendancy and made itself felt strongly enough to float us the six miles to Cape Ann. After passing Straitsmouth, we made a course N. by E. $\frac{1}{2}$ E., so as to pass outside the Isles of Shoals, and between the Nubble and Boon Island.

At 4:30 were off White Island light. An hour later were drifting in a flat calm, $3\frac{1}{2}$ miles to the N.N.E. of it. During the run-off the wind held steady from S. by W., so that we set our "spinnaker." We call it that when it is not doing duty as a jib. Our new friend, who will hereafter be known as the Steward, turns out to be an expert handler of the frying-pan and stew kettle, as well as a very pleasant fellow.

As there was considerable roll on and no wind to steady things, the Steward thought it best to stay on deck at 7:30 P. M., and the Skipper fed the crew on hot bouillon and bread, which they managed to stow away in great shape. At 8:30 P. M. the wind came out light from ahead, so that it was one the next afternoon before we made Portland Harbor. Left Portland at 3:30 P. M. and sailed up between the ever beautiful islands of Casco Bay to Pott's Harbor, where we spent the night. Passing Sand Island, we saw a large seal balanced on a pinnacle of rock, and passed him close aboard. He kept his weather eye on us, but did not seem at all alarmed. Distance 90 knots.

Early the next morning, with a strong S.E. wind and heavy rain, went out through the East Passage into the open ocean. Had a fine and exhilarating run in the heavy sea to Boothbay, where we went ashore for mail. This is a most beautiful region, and beginning to be

appreciated. At 3 P. M. ran out from the harbor to the eastward. The wind failed and the fog shut in thickly. We crept along by the Thread of Life and Pemaquid, and fearing to run into New Harbor in the dark and fog, with an enormous swell running and hardly steerage way, turned our bow seaward and drifted. It was cold and wet, we rolled atrociously, so that we could not light a stove to make coffee, the Admiral and the Steward were seasick, and the Skipper even was cold and miserable, in spite of sweater and overcoat. At 3 A. M. he came on deck, having been below for an hour trying to get a little sleep, and hearing surf apparently all about us, heaved the lead and found bottom at 17 fathoms. We anchored with a 50-fathom cable, supposing ourselves to be between Western Egg Rock and Haddock Island, the tide having set us in among the reefs. This position was found correct when the fog cleared late the next afternoon. We were in a flat calm from 4 P. M. Aug. 3 to 5:30 P. M. Aug. 4; then a little ripple blew us over the two miles to New Harbor and stopped.

5 A. M. the next morning found us under way, with a crisp breeze from the north, which ran us out by Mark Island, through Davis Strait, by Marshall Light to Whitehead. Here the wind failed and came out light from ahead. We beat up through Muscle Ridge Channel, across West Penobscot Bay and through Fox Island Thoroughfare to Carver's Cove, where we lay over night. Stopped an hour at North Haven for provisions, and met the Gerdaloon, a beautiful little schooner, whose owner very kindly asked us aboard. The day was nearly perfect. The beauty of the little islands, their rugged granite dotted with pointed firs, the clearness and brilliancy of the grays and soft greens of the land, the purplish azure of the sea and sky, the rounded outline of the Camden hills, the clear, bracing coolness of the air, the grateful heat of the sun, our little boat crisping steadily onward, made a combination as rare as it was beautiful, and we forgot the misery of the darkness and fog. Distance 40 knots.

Aug. 6.—A flat calm, but the same wonderful air. If this could last all summer this coast would be almost Paradise. The water is like ice, and one takes his morning plunge with trepidation, comes out with haste, and tingles with the afterglow. Light airs drifted us through Deer Island Thoroughfare, by Bass Head, and to an anchorage under the west end of Sutton's Island, almost in the shadow of beautiful Mount Desert. Barometer 8 A. M., 29.71; 8 P. M., 30.29. Distance, 28 knots.

The next morning we got under way in a thick fog, but the wind failed, and the high, rolling swell driving us dangerously near the Cliffs of Otter, we hurriedly dropped over an anchor and later had to abandon it, and some eight fathoms

of cable, because of our failure to "muzzle it" before trusting it on the rocky bottom. With a growing wind we ran in for Bar Harbor, the cliffs of Bald Porcupine coming out of the grayness only a scant hundred feet off the lee bow. The wind was freshening rapidly, and by the time we were in among the anchored fleet it was blowing a summer gale. Our first anchor dragged on the kelp, so the forty-two pounder was hastily thrown over and checked us a few feet from a large yawl, the Hadassah, after we had drifted so close to Amorita that they had to raise their port boatboom, which they did with very ill grace. After going ashore for a "Khotal" and other necessities and having lunch the wind had increased to a stiff gale with drizzling rain. Amorita was now dragging down on us, and not trusting our holding ground, we got our anchors with some difficulty and cleared out under close reefed mainsail. We had hardly more than gotten clear and out in the open beyond Iron-bound when the wind and rain came in terrific gusts from off Green Mountain, the driven spray and rain stinging like whip lashes, so that we soon had enough and ran in behind Bar Island to a secure berth.

During the night the gale blew itself out. The morning opened clear and fine. Ran over to Winter Harbor for letters and to pay our homage to the "Queen of Grindstone and Empress of Schoodic," with whom we later had the pleasure of dining. At 4:30 ran out with the idea of making a little to the eastward, but found an ugly looking squall rapidly making up to the S. W., so ran back and dropped our hook just as the wind, with the great fog masses, swept over the harbor.

The next morning opened beautiful and clear with a brisk north wind and crisp air. After our morning plunge and breakfast, got under way at 8:10 A. M. At 9:02 were off the north end of Schoodic Island, running E. $\frac{1}{2}$ N. for the striped buoy on Petit Manan bar. Passed this at 10:17 and Jordan's Delight Spindle at 11. The coast has become much more bleak and windswept. The ledges of the hills are bare except for a few stunted firs and tufts of sere brown grass. Moosabek Reach looks like the limit of civilization, and the houses of Jonesport are those of the Noah's Ark of our childhood. We ran by Cape Split, up through the Reach, between the Virgin's Breasts and out into the open by Mark Island, then at 1:10 P. M. turned our prow homeward. Beating down through the Reach in a brisk whistlesail breeze, and against a strong tide we made Nash's Island Light again at 3 P. M., Jordan's Delight at 3:42 and the buoy on Petit Manan at 4:28. The wind had held steady, but the west and so west had become gray and thick. One mile west from Petit Manan bar the wind suddenly shifted from N. N. W. to S. W., and then to W. S. W., and blew so fresh that we had to reef. At 7:45 P. M. we were at our old anchorage in Winter Harbor, having logged 74 knots in 11h. 35m., an average of over 6.4 nautical miles an hour, the best 12 hours' run that Altair has ever made. Our compass, after having no deviation, showed this morning on easterly courses a deviation of one point easterly. In the afternoon, on westerly courses, it was again true to the magnetic north. We were unable to determine the cause of the trouble, having searched in vain for any stray bits of iron in the pockets of the Admiral or Steward, while all of our anchors, lamps, etc., were stowed in their accustomed places.

Aug. 10 we passed at anchor at Winter Harbor in rain and fog waiting for letters.

Drifted next day and finally crept in behind the island off the entrance to Some's Sound, and anchored at 6:30 P. M. In spite of the fact that we had almost no wind, we enjoyed the rugged beauty of Mt. Desert Island and the crisp, clear air of a beautiful day.

Under way at 6:30 A. M., with a fresh easterly wind, which drove us through Casco Passage and Eggemoggin Reach by Cape Rosier and up to Castine. Here we found a green, picturesque little town and went ashore for provisions and a run on the grass. Later a zephyr from the north carried us across the bay to Turtle Head and down the westerly side of Long Island to Seal Harbor.

The dawn found us gliding softly out of the green circle of Seal Harbor and down by the shores of Long Island. The Penobscot is beautiful in its wide expanse, its purple distances and nestling villages. The waters reach up into little sandy or rocky coves, rimmed with green turf showing glimpses of cool darkness as it stretches away between the trunks of the balsam firs, or rocky wooded promontories alternate with cleared and fertile fields. As we ran down by Long Island behind and to the west were the green, softly rolling hills of the mainland and south the misty distances of the lower bay and ocean. Shortly after 8:30 A. M. the wind failed and left us close in toward the shore of a little rocky cove. The Steward tried to lure the wily cod, but failed and did not even get a nibble. A breath came in from S. W. at about one, and gradually freshened for a time, so that we worked down by Owl's Head and Ash Island to Whitehead, and across to Tennant's Harbor.

Fog came in during the night, but by 10 A. M., when we had finished breakfast, there was a nice S. E. breeze, and we sailed away for Mosquito Island and the westward. The wind failed to keep its promise, and we finally drifted in by Ram Island Light with the off-shore fog signals booming dismally, and anchored near Booth Bay at 9:30 P. M.

AUG. 15, 16, 17.

After going ashore for letters sailed off into the fog, through Townsend Gut into the Sheepscot, and up toward Wiscasset. The run through the Gut is along narrow, wooded, picturesque reaches. Going up the river we had a strong head tide and but little wind, so that to keep out of the strength of the ebb we ran close along the bold, rocky shore. We joked of our "local knowledge" and incidentally kept a lookout for snags. We sailed along this way for several miles, and all went well until off Captain Huff's at Edgcombe, when we slid softly but effectually on to a point of rock and stuck. Sail was dropped as if we were a great bird folding its wings, and a kedge was run out into the river, but we were immovable, though

ahead, on either side, and astern the lead showed from 7 to 12 feet. The tide falling rapidly had still 8 feet to drop. We hastily carried out our heavy anchor as far as possible off shore, and the second in weight to a rocky spur on the beach. Then using the throat halliards on the off-shore cable, and the jib halliards on the one toward shore, we purchased the cables to the masthead with an equal strain on each, so that as the tide left us high and dry on the two feet wide, flat-topped pinnacle of rock, which, fortunately, was just under our center of weight, Altair was kept on an even keel and as secure as if she were docked, even though her position looked extremely precarious. As soon as things were secure we went ashore, not caring to stay aboard and run the risk of having the whole outfit tumble off its perch if we moved about. While waiting we had calls and offers of assistance from several passing boats, one party, including a bright and attractive young woman, coming ashore to us, thinking that they knew the yawl. They were living at a cottage a mile above and their private cry, we were informed in the course of an invitation to dine with them, was "Yip-Yip." However, we stayed near Altair and spun yarns, especially with one ancient mariner, who told us in graphic way of "Semmes d-n him" and of three times that his ship escaped from the guns of the Alabama. The first time was off the coast of Nova Scotia, and the escape was made by running inside the islands and reefs, where the warship dared not follow. On the other two occasions a clean pair of heels gave the cruiser the slip. At 5:30 the Admiral opened negotiations with Captain Huff's wife for supper for three, and when this business was disposed of we had more yarns. Altair floated off about 9 P. M., and we had a half hour's disagreeable and wet work in black darkness and rain, getting our tackle aboard. Rode to the heavy anchor all night and cleared out early the next morning for Wiscasset. Went ashore on a crumbly wharf and looked the old town over. In its early years a place of brilliant promise, it is now in its second childhood, but still bears traces of beauty. At 10:30 A. M. started to beat down the river, saluted and were saluted by the Yip-Yips. Had a beautiful sail down against wind and tide, and in an air warm with the scent of pine. At 2 P. M., off Middle Mark Island, in the river mouth, we got the cold wind from the ocean, and there was an instant demand for sweaters. At 3:25 P. M. were off Griffith Head, wind S. W., moderate, considerable swell and sea. Outside the wind seemed stronger off shore, so we ran out by Seguin, expecting to make Small Point and Horse Harbor on the port tack. The wind headed us, however, and dropped, so, rather than run inshore among the reefs in the dark, we kept on for Cape Elizabeth, which we passed at 3 A. M. The night was extremely clear and cloudless, but with only light and fickle airs. At 10 A. M. were off Kennebunkport, wind light. Ran in close under Point Arundel and exchanged salutes with friends. At 3 P. M., off White Island (Isles of Shoals), the wind fell very light, and we came about for Portsmouth. Inside the river the swift ebb, strong enough to pull under the can buoy at Pull-and-bad-damned Point, made it impossible for us to go up to the city, and we anchored of Kittery, on the Maine side of the river. After supper the Admiral and Steward went ashore for some provisions and to find where we could get some water. They returned at 9:30 P. M., and we all turned in for a well-earned sleep.

The water boat came out early and woke us at 6:40 by bumping alongside. At 7 we were trying to make out of the river against the baffling currents.

Steered south for Thatcher's Island and passed it in a very light air at 5 P. M., having to beat the last fifteen miles with a light air against a head tide. Did not reach our anchorage in Gloucester inner harbor until 9:30.

AUG. 19.

Went ashore and said good-by to the Steward, who had been called home, had a leaky valve in our kholat repaired and nearly blew up the plumber, and then went on the trolley to Long Beach for luncheon. In the afternoon wrote letters and loafed.

AUG. 20, 21.

Morning opened foggy, but by 9:30 it showed signs of clearing, and we got under way with a light north wind, which carried us only a mile beyond the harbor mouth. The wind came in light from E. S. E. at 2:45, drove us slowly along for a time and then again failed. At 8 P. M. were able to get a "fix" by a sextant angle and range on Minots and the Gurnet a few minutes before we were shut in by fog. Drifted in the fog all night with light airs from S. to E. At about 2 A. M. we began to hear fog horns, and soon the whole eastern quadrant seemed filled with the sounds. We were on the starboard tack, and so had the right of way through a fleet of mackerel schooners. Time after time a voice would come through the mist: "Hello! How are you heading?" "Southeast by East," would echo back, and then we would hear the quick-spoken command, "Luff!" or "Keep her away!" "Steady!" and we would perhaps for an instant make out a green, or red radiance in a halo of mist. At dawn we supposed ourselves about three miles west from Wood End. Like Noah, we wanted to be sure and so sent out that trusty bird the "blue pigeon," which, after several flights, so as to get a line of soundings, showed that we were a mile south of our calculated position. Made the requisite change of course, and in due time ran up the harbor with a spanking breeze from N. E. Shortly after we reached our anchorage the fog lifted.

AUG. 22, 23.

Last evening, after a swim, turned in at 9:30, and were asleep before we had time to more than pull the blankets over ourselves; 11:20 the next morning found us off Wood End with a bright, clear sky and light S. E. wind that showed a tendency to go around to S. and W., but it backed again to S. E. Bucking against a strong head tide, we finally worked around to the Highland Light, distant one-half mile W. at 6:15 P. M. Soon after this the wind freshened to a reefing breeze, dark, heavy cloud masses piled up in the S. E., while swiftly-scudding wisps of vapor flew past the young

moon. A schooner beating down near us gave up and ran back under the cape. An hour later (8:30), when in sight of Nausett, we had the alternative of setting a storm trysail and spending the night in a foggy gale or of returning to Provincetown, so for the first time in Altair's history we turned tail and ran. Fog soon shut down thick, but the fresh wind held. We had no trouble in picking up the whistle off Peaked Hill Bar, for the rising swell made it moan dismally. Race Point was given a wide berth, and we stood in for Wood End, keeping the lead going as we neared the beach. We had gotten into only 18 feet of water and Skipper was giving the order to go about, when the red glow of the light flashed into view dead over the bowsprit end.

It was a fine sail in spite of the fog, the water fire leaping in broad sheets as we smashed into the seas and trailing in our wake like a million fireflies. Turned in at 3 A. M., at our former anchorage, west of the steamboat wharf, and slept to make up for lost time. In the afternoon, as there was a strong S. E. wind, sailed about the harbor just to keep in practice.

Aug. 24 was rainy and thick with strong S. E. wind. Early in the evening the mackerel fleet of over thirty sail came in, as there was a heavy breaking swell outside. Blew very fresh during the night.

AUG. 25, 26.

The early morning was most gloomy, with heavy clouds covering the sky and a light gale from the north. Determined to have a look at the sea, we ran out. Had to reef mainsail and shift jibs. After a hard beat to Race Point the wind moderated and the sky gave promise of clearing. Shook out reef, set jib and at 2 P. M. passed the Highland. Wind north. Heavy swell from east and from northeast. Wind moderated but held a fair breeze; so that Nausett was abreast of us at 3:30. Shortly after this the wind fell to a light air, and after drifting us beyond the Pollock Rip Light vessel, failed entirely, so that, as the tide was beginning to run against us, we were obliged to anchor, choosing a position well to the south of the steamer line and a little behind a big four-poster, where we would be less likely to be run into in case of fog. There was a heavy, short, confused swell running, so that the motion was most unpleasant. At midnight fog, cold and wet had shut us in, so one of us had to keep anchor watch and ring our "bell," a most efficient combination of the chafing dish cover and a big iron spoon. It seemed that there was no end to the tugs with tows that came our way. At daylight there were many sharks swimming leisurely about, several coming quite near. As soon as the run of the tide favored us, we got up sail and anchor, and though there was no wind, managed to drift in by the Handkerchief. A light air from N. E. finally enabled us to make Hyannisport, where from our anchorage we watched the finish of a regatta, and turned in at 7 P. M.

When we awoke at 5:43, it was a most perfect morning. There was a light N. E. breeze blowing. Swam around the boat to wake ourselves up, dressed, got up sail and at one minute before six were under way. The wind continued fair to Nobska, died away to a zephyr for a while, and then came back true and brisk from east, driving us steadily along with jib set as spinaker. We went through Quick's Hole, by Penikese, with its solitary scrub-embowered house, memorable as the summer home of Agassiz, and straight away across the blue and shining sea for Jude, which we passed at sunset in a failing wind. As the Admiral was worried about his wife and anxious to get home, we kept on for Watch Hill and New London, if possible. The wind soon freshened again and held true and steady all night. The run from Penikese to Watch Hill was made without touching a sheet. From Watch Hill through Fisher's Island Sound to Plum Gut was against a strong adverse tide. At 5 A. M. Altair folded her wings by the basin at Greenport. The skipper took the Admiral ashore in time for the early train to New York, breakfasted in solitary state, hauled into the basin and at 11 A. M. Altair was stripped and out of commission.

Riverside Y. C.

GREENWICH, LONG ISLAND SOUND,

Saturday, September 26.

The fall regatta of the Riverside Y. C. was sailed on Saturday, September 26. There were only thirteen starters, but all the boats that came to the line finished. Mimosa had no competitor in the 30ft. class, and she sailed against Anoatok and Spasm in the class above. The course for the boats in the 30ft. class was from the gas buoy off Greenwich Point to a mark off Matinick Point, thence to and around a mark off Eaton's Point, and back to the starting line, a distance of eighteen miles. The breeze was S. W., making the first leg a beat, the second a reach, and the third a reach. The raceabouts and 25ft. sloops covered a 14½-mile triangle, while the 18ft. sloops and the Manhasset Bay one-design boat went over a 10-mile triangle.

The preparatory signal was given at noon, and five minutes later the 36-footers were sent away. Mimosa got the start, leading both her competitors over the line. They soon passed her, however, and she was the last of the trio to finish. Anoatok finished 25s. ahead of Spasm, but it is very likely she will lose the race to Mimosa on corrected time.

The raceabouts started at 12:10. Jolly Roger led over the line, followed by Galatea, Rogue and Hobo, in the order named. Galatea worked into the lead and won the race. Jolly Roger finished second and Hobo third.

Firefly got the start in the 25ft. class, but she was beaten out by Robin Hood. Hour, one of the Larchmont one-design 21-footers, took a sailover.

In the 18ft. class Cricket gave Ity Bity a good beating, and Lambkin took a sailover in the Manhasset Bay one-design class.

The Regatta Committee, made up of Messrs. Charles P. Tower, George T. Higgins and Edwin Binney, were on Commodore Tyson's schooner Nirvana. The summary:

Sloops—36ft. Class—Start, 12:06—Course 18 Miles.	Finish.	Elapsed.
Anoatok, W. G. Brokaw.....	3 07 23	3 02 28

Spasm, E. D. King.....	3 07 48	3 02 48
Mimosa, T. L. Park.....	3 15 05	3 10 05
Raceabout Class—Start, 12:10—Course 14½ Miles.		
Jolly Roger, T. B. Bleecker.....	3 05 08	2 55 08
Hobo, T. L. Park.....	3 05 36	2 55 36
Galatea, A. P. Stokes.....	3 03 52	2 53 52
Rogue, A. B. Alley.....	3 10 58	3 00 58
Sloops—25ft. Class—Start, 12:15—Course 14½ Miles.		
Robin Hood, George Gartland.....	3 19 06	3 04 06
Firefly, G. P. Granberry.....	3 20 04	3 05 04
Larchmont Y. C. One-Design Class—Start, 12:15—Course 14½ Miles.		
Hour, J. H. Esser.....	3 16 40	3 01 40
Sloops—18ft. Class—Start, 12:20—Course 10 Miles.		
Cricket, F. E. M. Whiting.....	3 36 27	3 16 27
Ity Bity, William Douglas.....	3 46 05	3 26 05
Manhasset Bay Y. C. One-Design Class—Start, 12:25—Course, 10 Miles.		
Lambkin, S. W. Roach.....	3 24 49	2 59 49

The winners were: Galatea, Robin Hood, Hour, Cricket and Lambkin.

Williamsburg Y. C.

FLUSHING BAY, LONG ISLAND SOUND,

Sunday, Sept. 28.

Thirty-three boats of the Williamsburg Y. C. sailed in the Fall Regatta, held by that club on Sunday, Sept. 28. At the start the wind was moderate from the S. W., but it increased during the race, and at the time of the finish it was blowing quite fresh. A heavy thunder storm broke shortly after the boats reached their moorings.

The boats covered a triangular course. The first leg was from a starting line off the club house to a mark off College Point, thence to and around a mark off Hunt's Point and back to the starting line. The first two legs were reaches and the third was a beat. The boats sailed twice over the triangular course, making a distance of about twelve miles.

The preparatory signal was given at 2 o'clock, and the 30ft. sloops were sent away ten minutes later. The summary:

Class A—Cabin Sloops 30ft. and Over—Start, 2:10.		
	Finish.	Elapsed.
Cornelia, Com. James' Lalor.....	4 00 00	1 50 00
Class B—Cabin Sloops 25 to 30ft.—Start, 2:10.		
Amy, William McDonnell.....	4 08 00	1 58 00
Caracen, Muro & Kloppe.....	4 06 40	1 57 40
Ingomar, Silk & Ollejo.....	4 17 14	2 07 14
Pinochle, Babst & Jacoby.....	3 58 00	1 48 00
Allen.....	4 11 30	2 01 30
Class C—Cabin Sloops 25ft. and Under—Start, 2:20.		
Pearl, W. E. Long.....	4 08 40	1 48 40
Jack Rabbit, C. Cohen.....	4 15 00	1 55 00
Ripple, M. Wais.....	Did not finish.	
Class D—Cabin Yawls over 25ft.—Start, 2:20.		
Pastime, James Schuessle.....	4 26 30	2 04 30
Digmus, J. H. Symmers.....	4 25 10	2 03 10
Class E—Open Sloops Under 25ft.—Start, 2:25.		
Imp, Daniel Reynolds.....	4 29 00	2 04 00
Eleanor, McGregor.....	Did not finish.	
Viola, J. Keppler.....	4 40 00	2 15 00
Phidias, C. Kirchlof.....	4 41 30	2 16 30
Class F—Cabin Cats over 25ft.—Start, 2:25.		
Whiteway, M. Cartwright.....	4 16 00	1 57 00
Teddy, Jr., Ed. Rae.....	4 08 30	1 49 30
Class G—Cabin Cats 25ft. and Under—Start, 2:25.		
Yankee Girl, Chapman Brothers.....	4 28 00	2 03 00
Elitay, W. Ebmeyer.....	4 35 30	2 10 30
Johanna, Menz & Kling.....	Did not finish.	
Vagabond, Bell & Dickerson.....	Did not finish.	
Spray, August Eberhardt.....	4 25 00	2 00 00
Sybil, C. H. Frisch.....	Did not finish.	
Florence, G. S. Card.....	4 32 00	2 07 00
Bessie, William Roth.....	Did not finish.	
Class H—Open Cats Under 25ft.—Start, 2:25.		
Mosgett, W. A. Robertson.....	Did not finish.	
Colleen, J. Cochran.....	4 20 00	1 55 00
Myra, H. Bertrain.....	4 40 00	2 15 00
Class I—Open Cats Under 20ft.—Start, 2:25.		
Colleague, Jack Hess.....	Did not finish.	
Demon, B. Fox.....	5 06 00	2 41 00
Chip, Charles Uhlye.....	Did not finish.	
Hobo, Frank McAllister.....	Did not finish.	
Irene, Norwalk.....	Did not finish.	

The winners were: Cornelia, Pinochle, Pearl, Digmus, Imp, Teddy, Jr., Spray, Colleen and Demon.

The Speed of Racing Yachts.

In a recent article in the Scientific American it is stated that Reliance was particularly intended to be fast when reaching and running, the designer taking some chances on other points of sailing in order to secure these advantages. The boat did not fulfil these expectations, being unable to beat Columbia on a reach, but curiously enough she excelled in windward work, even under the trying conditions of a light head wind with a heavy roll of sea. Her best observed speed on a 10-mile reach was 12.6 knots per hour.

Few yachtsmen trouble themselves about "best observed speeds." Many have but a vague idea of what their vessels can really do. Racing records accurately timed over measured courses prove nothing unless the conditions of wind and water are entirely favorable. A record run between two boats is seldom timed to the minute. Even if it is, the distance is often overestimated, land miles are confused with nautical miles, and liberal allowances made for time consumed in setting sails. When an owner has once figured out a satisfactory record he is wise to stick to it, particularly as he may never have a chance to do it again.

Many years ago Dixon Kemp published some best observed speeds of yachts of various lengths. As might have been expected, they varied pretty much as the square root of the respective lengths. In fact, they suggested the following rough and ready formula:

$$\sqrt{L} \text{ (in feet)} \times 1.25 = \text{miles per hour.}$$

Thus a yacht of 36ft. should be capable of 7.5 nautical miles per hour, and one of 100ft. 12.5 miles. This is very near to Reliance's best speed, and she probably sails on an inclined waterline of about 100ft. Many older boats of the size will sail as fast. The tendency of modern design has not been to improve reaching, and any slight gains on this point of sailing are probably due to better sails rather than to the form of the hull. A long lean craft like the old America will reach fast, but will be inferior in turning to windward, and almost the whole result of modern methods has been to develop exceptional weather-going qualities, especially in light winds. For reaching and running the above suggested formula will apply to

EFFORT.

most yachts of the ballasted type, but small craft of the sail boat type will require a much larger co-efficient, especially if they are sailed with live ballast. A case in point is the work of Thorella and Kolutoo in the recent Seawanhaka cup races. A full reach of a mile and a third was covered by Thorella in 8m. 17s., and by Kolutoo in 7m. 59s. This latter speed is plump ten knots, but both these records were beaten on the next leg, also a full reach of 1-3 miles, the times being Thorella 6m. 34s. and Kolutoo 7m. 1s. Thorella therefore covered a leg at the remarkable speed of 12.2 knots. The times were official and carefully taken, and the course was accurately logged—on several occasions—the marks being set permanently. The second and third rounds showed performances almost as good, but after Kolutoo withdrew Thorella was naturally not pushed. It is really astonishing that two small boats that might be carried on the deck of Reliance or Shamrock have actually come within a fraction of the highest recorded speed of Reliance herself.

Even the most unimaginative man will naturally inquire what might be expected of a 90ft. Thorella. This is a fascinating theme for the speculative writer. Thorella's measured waterline is 25ft. 4in., but when heeled she has an increased sailing length; call it 30ft., as the boat is only some 37ft. over all. The square root of 30 is say 5.5, so that a coefficient of 2.2 would be required to account for a speed of 12.2 knots. Applying this to a sailing length of 100ft. we have a suggestion (I do not like to use a stronger term) of 22 knots! To accomplish this it would be necessary to reproduce all the conditions on the larger scale, and this would include a crew for live ballast. The exact number required could be settled by experiment; but assuming that it would be in proportion to the third powers of the respective lengths, we have the following:

$$\frac{100^3}{30^3} \times 4 \text{ (Thorella's crew)} = 148$$

Such a boat would easily pick up all the active members of a yacht club, but this would be an advantage, and the sailing would be grand. There would be no special danger; the rig would be small, say five or six thousand square feet. One of the remarkable things about Thorella's reaching record is that it was made under 500 square feet of sail.

All sorts of reasons may be urged against the introduction of live ballast boats into the 90ft. class, but they would scarcely be more pronounced racing machines than Reliance and Shamrock. They would cost less to build, and incidentally afford some active sport for the Corinthian element. A boat with a working crew of fifty men and a hundred club members on the weather rail would really be a representative club boat.

W. Q. PHILLIPS.

CLINTON, Ont., Sept. 24.

Death of Mr. Arthur E. Payne, M. I. N. A.

From *The Yachtsman*.

YACHTSMEN everywhere will learn with regret of the death of Mr. Arthur E. Payne, the well-known yacht designer, of Southampton, which occurred at his residence, Hope Villa, Portswood, early on Wednesday morning, Sept. 9, after a prolonged illness, which, during its later stages, brought him much suffering. Mr. Payne, who has always been a delicate man, was about two years ago warned by his medical attendant, Dr. Keele, that he was affected with heart disease, and since that time he has taken a mere passive interest in the everyday life around him, and has done little active work in the profession to which hitherto he had been so greatly devoted. He was one of several sons of

brought him more than local fame as a designer. He was responsible for the designs of 175 yachts of various classes and sizes, the largest being Sir Henry S. King's fine yawl *Glory*, 205 tons. *Nan*, *Humming Bird*, *Lollypop*, *Miss*, *Maharanee*, *Decima* and some others, were among his earliest successes. His latest was the *Duet*, 24ft. Solent rater, built early in 1902, for Mrs. Schenley and Miss Cox, as the successor of the *Speedwell*, which was built for Miss Cox in 1896 and held top rank in her class for five successive seasons, and was then only put out of it by the new rule. Other great successes were the *Babe* and *Garreth* 2½ raters. Mr. Payne was architect of three Royal Cup winners—*Corsair*, 40-tonner, which, under Admiral Montagu's flag, won the Queen's Cup at the R. Y. S. regatta at Cowes in 1892, by time, against the German Emperor's *Meteor* I.; *Caprice*, 20-tonner, which gained the Royal trophy for Sir Henry S. King on the Thames in 1899, and was a very successful racing boat; and *Leander*, the Hon. Rupert Guinness's 98-ton yawl, which won the first cup given to the Royal Yacht Squadron by King Edward after his accession. His largest racing venture was the *Tutty*, 65-footer, built in 1898; and other vessels which brought him fame were the *Penitent*, 52-footer; *Gloria*, 20-tonner (now in Toronto), which brought the *Coupe de France* from the Mediterranean; and *Laurea*, which successfully defended that trophy in the two following seasons, under the flag of the Royal Temple Y. C.; *Balcena*, *Gauntlet*, and *Camellia*, 52-footers; the fine, bold cruiser *Betty*, built for Mr. John Gretton, M. P.; *L'Esperance*, yawl, built for the Earl of Dunraven, and afterwards owned by Prince Henry of Prussia; *Vendetta*, 40-rater, built for Admiral Montagu; *Emerald* and *Girleen*, 36-footers; *Mayfly*, 2½-rater; *Palmosa*, a handsome cruiser, turned out last year; and many others which illustrated his genius. Among the numerous other vessels he designed may be named: *Artemis*, 91-ton yawl; *Bertha*, 91-ton yawl; The Earl of Dunraven's two *Cariads*; *Heartsease*, yawl; *Javelin*, ketch; *L'Allegra*, *Endrick*, *Flavia* and *Polynia*, 36-footers; *Hyacinth*, *Isola*, *Seabird* and *Siesta*, yawls; *Chimera* and *Eleanor*, s.s.; *Lady Nan*, *Vanda*, *Nan*, *Nepenthe*, *Papoose*, the two *Banbas*, *Bandicoots* I. and II.; *Wayward*, *Valeria*, *Chiquita*, *Chough*, *Guenora* and *Alwida*. Mr. Payne was only forty-five years of age. He was twice married, and leaves a widow, a son (who is following the same profession), and three daughters. The funeral took place on Saturday afternoon in Southampton Cemetery, the remains being followed to the grave by deceased's son, his two brothers, Messrs. J. and S. Payne, his partner, Mr. W. Summers, and about sixty employees of the firm of which he was a director. Mr. J. G. Fay, several yacht captains and others identified with yachting joined in the cortege and assembled at the graveside.

At the annual meeting of the Keystone Y. C., of Woodmere, L. I., the following officers were elected: Com., John J. Wood; Vice-Com., Frank K. Walsh; Sec., Charles S. Wright; Treas., William H. E. Jay; Governors, John J. Wells, John J. Wood, Charles S. Wright and William H. E. Jay; Treas., Dr. E. C. Smith.

Damage Done by the Recent Gale.

THE recent heavy southeast gale that visited the vicinity of New York on Wednesday, Sept. 16, did great damage to the yacht fleet.

The Gravesend beach shows working schooners and

THE WRECK OF THE STEAM YACHT FULCONIS AND THE SLOOP CORLETTA.

yachts piled promiscuously along the shore. One large schooner capsized lies off the beach with one side and her topmasts partly above water.

Some yachts sank at their moorings, others came almost unharmed, high and dry on the sand—others, and there were only too many so—came in against the piers and walks and ground themselves all to splinters.

Upon Long Island Sound, Echo Bay, at New Rochelle, shows every one of the three floats smashed to bits.

Adelaide, owned by J. Dwyer; Sneaker, F. W. Vulte; Kazabo; N. Vulte, and several rowboats ground to-

PYXIE ON THE ROCKS WITH HER STARBOARD SIDE TORN OUT.

gether on the beach. Gossip dragged in on the rocks and sank in deep water. Others ashore were the Carrie, Sasqua, Katrina, Nonie, Abcona and Edna.

Off Larchmont things were just as lively as our illustration will show. Pyxie, 23ft. waterline, 36ft. over all, designed by Mr. Wm. Gardner for Mr. Oswald Sanderson and built by Wood, of City Island, in 1892, came ashore and pounded all her starboard side in on the rocks at Umbrella Point.

The sloop yacht Corletta went high and dry among the rocks farther around the point in a little cove, with the exception of a chewed up keel, a bent rudder and broken bowsprit, she was not much damaged, but the steam yacht Fulconis, launched from City Island about a month ago for Mr. C. W. Holtz, came ashore at the same place and broke all to pieces, blocking the Corletta. The steamer's bow was chewed all to splinters, her decks broken up, making a total wreck of her.

C. G. DAVIS.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Mr. Charles Barton Keen, a Philadelphia architect, has prepared plans for two buildings for the Corinthian Y. C. of Philadelphia, at Essington. They will consist of a two-story stone and frame storehouse, 96 by 44ft., and a one-story stone and frame sparhouse 41 by 26ft. The cost of the two will be \$6,000.

The New York Nautical College, of New York City, has established a department for instruction in yacht design. The course will be conducted by Mr. George Crouse Cook. Three general courses have been arranged to meet the requirements for the design and construction of both steam and sail yachts. The training to be given in the courses will be very practical, and each student will be thoroughly grounded in the knowledge of elemental and advanced yacht calcula-

tions relating to displacements, centers, stability, strength and propulsion; the types and methods of hull construction in wood and steel, and the theoretical principles of design. Between two and three months are required to complete each course, and day and evening classes can be arranged to suit the students.

Rifle Range and Gallery.

Rifle and Revolver Matches at the Old Guard Fair.

THE shooting committee appointed by Major S. Ellis Briggs, chairman of the executive fair committee of the Old Guard, to build galleries for rifle and revolver shooting in the basement of the Madison Square Garden and plan matches to be shot during the Old Guard fair, which will occupy Madison Square Garden throughout the week opening Monday, Oct. 5, has almost perfected its plans. The shooting committee is presided over by Col. Leslie C. Bruce, of the Old Guard, who recently led the American Rifle team to its great international triumph at Bisley, England. Capt. Thomas W. Timpson is vice-chairman, and Lieut. Lee R. Townsend, secretary-treasurer. The other committeemen are: Capt. George E. Libbey, Capt. James C. Summers, Lieut. Fred C. Seybel, Lieut. C. H. Rockwell, Lieut. Thomas H. Keller, Lieut. J. W. Miller, Sergt. Fred T. Adler and Sergt. James McNevin.

The committee has contracted for the building in the Garden of the most complete outfit of ranges and accessories for rifle and revolver shooting ever erected for an indoor temporary occasion. The ranges will be in charge of the Zettler Brothers, and will be opened at 1 o'clock and until 11 o'clock P. M. each day of the fair.

The committee has already secured cash and merchandise prizes, the latter chiefly guns, revolvers and shooting equipments, amounting in value to over \$1,000.

The events—details and prizes to be published later—already arranged are: Rifles—Continuous match, open to all; souvenir point target match, open to all; 50-shot interscholastic match, open to pupils of any school, for special prizes. Revolvers—Re-entry continuous match, for any revolver, to be shot on Standard American target. Rapid-fire match. It is probable that the committee will add to this list and that the additions may include both rifles and revolver competitions for the members of the press visiting the fair.

Mr. E. I. Kennedy won the gold medal, Mr. W. W. Wobbert the silver medal, and Mr. James Porter the bronze medal at the regular monthly shoot of the Cumberland Valley Rifle Association, Sept. 26.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Oct. 1-2.—Jersey Shore, Pa., Gun Club shoot.
- Oct. 1-2.—Austerlitz, Ky.—Two-day live pigeon tournament of the Hill Top Gun Club. Geo. W. Clay, Sec'y.
- Oct. 3.—Harrisburg, Pa.—Team race, Lykens vs. Harrisburg.
- Oct. 6-7.—Des Moines, Ia.—Two-day shoot of Messrs. Whitney & Milner.
- *Oct. 6-7.—Allegheny, Pa.—North Side Gun Club's tournament. L. B. Fleming, Sec'y.
- Oct. 6-7.—Kansas City, Mo.—First Grand Afro-American Handicap of the Afro-American Trapshooters' League. T. H. Cohron, Sec'y.
- Oct. 7.—Sheepshead Bay, L. I.—Three-man team race for target championship; three-man teams of the East.
- Oct. 8-9.—Dalton, Ohio, Gun Club's fifth annual tournament. H. Santmyer, Mgr.
- Oct. 8-9.—Clinton, Ont., Gun Club's thirteenth live-bird and target tournament; \$300 guaranteed. J. E. Cantelon, Sec'y.
- Oct. 8-10.—St. Joseph, Mo.—Thirteenth annual tournament of the Missouri State Amateur Shooting Association. F. B. Cunningham, Mgr.
- Oct. 9-10.—Harrisburg, Pa., Shooting Association's seventeenth annual tournament. A. H. Roberts, Sec'y.
- Oct. 9-10.—Tournament of the Olney, Ill., Gun Club; prizes and added money. J. W. Marks, Jr., Sec'y.
- Oct. 9-10.—Sixteenth annual fall tournament of the Harrisburg, Pa., Shooting Association. A. H. Roberts, Sec'y.
- Oct. 11.—Brooklyn, L. I.—Opening all-day shoot of the Fulton Gun Club.
- Oct. 13.—Muncie, Ind.—Fall tournament of the Magic City Gun Club.
- Oct. 13-14.—Olean, N. Y., Gun Club fall tournament. B. D. Nobles, Sec'y.
- Oct. 13-15.—Omaha, Neb., Gun Club's twelfth annual tournament. W. D. Townsend, Sec'y.
- Oct. 14-15.—Baltimore, Md.—Ninth annual tournament of the Baltimore, Md., Shooting Association; targets and live birds; \$100 added; open to all. J. R. Malone, 2671 Penn. Ave.
- Oct. 14-17.—West Baden, Ind., Gun Club tournament; \$500 added. John L. Winston, Mgr.
- Oct. 15.—Batavia, N. Y.—Holland Gun Club annual fall tournament.
- Oct. 20-22.—Paducah, Ky., Gun Club tournament. W. A. Davis, Sec'y.
- Oct. 23-24.—New London, Ia., Gun Club tournament. Dr. C. E. Cook, Sec'y.
- Oct. 23-25.—St. Louis, Mo.—Combination live-bird and target shoot at Du Pont Shooting Park. Open to all. Special event, 50 live-bird handicap. Alec D. Mermod, Mgr.
- Oct. 26-31.—French Lick Springs, Ind.—First grand tournament of the National Gun Club; \$500 added. John M. Lilly, Pres.

*Members of Western Pennsylvania Trapshooters' League. Chas. G. Grubb, Sec'y, 507 Wood street, Pittsburgh.

**Members Southern Trapshooters' Game and Fish Protective Association. J. J. Bradfield, Sec'y, Vicksburg, Miss.

1904.

Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Carlisle, Pa., Gun Club, contemplates holding a tournament on Oct. 13.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, was a visitor in New York on Friday of last week.

The Homer Gun Club, of Merchantville, Pa., began its fall series with a live-bird and target shoot at Maple Shade on Sept. 26.

At Mahanoy City, Pa., Sept. 26, John Kates defeated John Bettner, in a 7-bird match, scoring 6 to 3, and is reported to have won \$75.

Mr. B. D. Nobles, secretary of the Olean, N. Y., Gun Club, informs us that Oct. 13 and 14 are the dates for his club's forthcoming tournament.

Mr. W. P. Thomson advises us that the Hamilton, Ont., Gun Club will hold its shoot for 1904 on Jan. 12-15. The competition includes both live birds and targets.

Mr. J. S. Fanning, of the Lafin & Rand Powder Co., after a tour of many months, which comprised nearly all the States in the Union, has returned to New York.

The Independent Gun Club, of Easton, Pa., and the Lehigh Rod and Gun Club, of Bethlehem, Pa., will engage in a ten-man team contest at Easton, on the afternoon of Oct. 3.

The Holland Gun Club, Batavia, N. Y., has fixed upon Oct. 15 for holding their annual fall tournament. The members of the tournament committee are Messrs. J. B. Knickerbocker, Jay L. Robson and Harry Ames.

The cups offered by the Sheepshead Bay, L. I., Rod and Gun Club, for competition in the three-man team race of Oct. 7, will be on display in the windows of Messrs. Von Lengerke & Detmold, 318 Broadway, in the near future. There is one for each member of the winning team.

The Harrisburg, Pa., Shooting Association are energetically preparing for their seventeenth annual tournament, Oct. 9 and 10. The hustling and skillful trade representative, Mr. Frank Lawrence, will act as tournament manager.

Mr. W. L. Alexander won the individual championship trophy emblematic of the championship of Perry county, at Duncan, Pa., Sept. 26. Messrs. R. Owens and F. Diebold tied with him on 22 out of 25; in the shoot-off Mr. Alexander won.

Mr. E. Hough has severed his business relations with FOREST AND STREAM, hence mail addressed to us at Chicago is subject to delay. We suggest to our correspondents that their letters to us be addressed direct to New York to insure prompt delivery.

Eight men strong, Sept. 26, of Poughkeepsie invaded Ossining with a purpose, one of a series, to collocate the cup. A mere matter of ten targets' difference in the team race was the obstacle which postponed the collocation. Ossining, 163; Poughkeepsie, 153.

Mr. J. R. Malone, 2671 Pennsylvania avenue, Baltimore, Md., informs us that Oct. 14-15 have been fixed upon as the dates for the ninth annual tournament of the Baltimore Shooting Association. The competition will be at both targets and live birds; open to all. Added money, \$100.

Mr. George R. Haswell, Mayor of Circleville, O., was in New York several days of last week attending to official business. He left for his home last Friday. Mr. Haswell is eminent in the world of sportsmanship, he being secretary of the Ohio Field Trial Association and eminent as a skillful trapshooter.

The Magic City Gun Club, of Muncie, Ind., has issued the programme for its fall tournament, Oct. 13. There are twelve events, each at 15 targets, entrance \$1.50; purses divided 25, 20, 20 and 15 per cent. Shooting commences at 9 o'clock. Shells shipped to Mr. Claude Stephens will be delivered on the club grounds.

Mr. Carl Bittner, recently of the firm of Bittner & Jaeger, will leave for Suhl IV. 137, Germany, in the near future, where he will join Mr. Jaeger in business under the firm title of F. Jaeger & Co. Mr. Jaeger left New York recently, after completing all the preliminary arrangements for the manufacture of the single trigger in Germany.

At the Interstate Association shoot at Scranton, Pa., Sept. 23 and 24, Mr. J. A. R. Elliott won high average for the two days, 163 out of 175, on each day, 326 out of 350, an average of over 93 per cent. in most unfavorable weather conditions. Mr. L. J. Squier was second each day, 161 the first day, 157 the second day, an average of about 91 per cent.

The Chicago Gun Club weekly shoot last Saturday was marked by some good shooting. W. P. Stannard won first prize in the club shoot, making the only straight score. M. Parker took the second prize, and M. Zacker third. In a 15-target handicap Weart divided the first money with Parker and Stannard. Lem Willard won second money, and Dr. Morton won third.

The following, taken from a local paper, was included to us under date of Sept. 25, and will be a source of genuine pleasure to the many friends of Mr. Lockwood, who is famous as a skillful and true sportsman. The clipping recounts that "Mr. C. A. Lockwood, president of the Jamaica Water Company, Jamaica, L. I., who is staying at the Kolaneka Hotel, and Charles Fuller, of this city, have returned after a short hunting trip in the Adirondacks. The gentlemen brought back two deer, which are now on exhibition at John P. O'Neil & Son's meat market, Johnston, N. Y."

Secretary F. McHolloway writes us as follows: "The programme for the first tournament of the National Gun Club, of Indianapolis, to be held at French Lick Springs, Ind., Oct. 26-31, promises to be varied and interesting, and Mr. Taggart is said to have 'something up his sleeve' for the last day which he does not betray. The sterling silver sparrow and target trophies have been received and are now on exhibition in Indianapolis. Programmes will be mailed early in October, and will give time tables of trains between French Lick and Chicago, Cincinnati, Louisville and Indianapolis."

The target tournament to be held at West Baden Springs, Ind., Oct. 14-17, under the management of the renowned trapshooting expert, Mr. J. L. Winston, has an attractive programme, not the least attractive part being \$500 added money. There are ten events each day, aggregating 175 targets and \$17.50 entrance. In the 100-target handicap, \$5 entrance, \$250 will be added. The moneys will be divided 40, 30, 20 and 10 per cent.

A correspondent writes us that "the Mountain Brook Gun Club, of Lykens, Pa., under the leadership of ex-Senator F. A. Thompson, have accepted an invitation from the trapshooters of Harrisburg to shoot a team race in Harrisburg, Oct. 3. In accepting the invitation, Mr. Thompson writes he will bring thirty shooters, who will shoot on the Lykens team. They will be met at the depot by the Harrisburg shooters and escorted to the hotel, where dinner will be served, after which they will be taken to the grounds of the East Side Shooting Association in a special car. It is the intention of the trapshooters of Harrisburg to do everything possible to make their visit a pleasant one."

In the great tournament of the Indianapolis, Ind., Gun Club, held last week, the admirable trapshooter, Mr. W. R. Crosby, of O'Fallon, Ill., won high average at targets with a 97 per cent. performance, and the sparrow championship after a shoot-off with three others who were in the tie with him, namely, Snyder, Stilwell and Snipe. Mr. Geo. Roll, of Blue Island, Ill., won the English Hotel cup. He and Mr. A. C. Connor, of Pekin, Ill., tied on 98. Two shoot-offs were necessary to determine the winner. In the first shoot-off each scored 24 out of 25; second shoot-off, Roll 24, Connor 23. Mr. Chan M. Powers, of Decatur, Ill., won first highest amateur average by breaking 380 out of 400, a 95 per cent. performance. The professionals close up to Crosby were: Hirschy, 96½ per cent.; Heer, 95 per cent.; Budd, 94 per cent.; Heikes and Gilbert, 94½ per cent. The amateurs close up to Powers were: Connor, 93¾ per cent.; Le Compte, 93 per cent.; Roll, 92½ per cent.

The target tournament of the Western Pennsylvania Trapshooters' League, at Allegheny, Pa., Oct. 6 and 7, has a programme alike for each day, alternately 15 and 20 targets; entrance \$1.50 and \$2; targets, 2 cents, included in entrance. From each target trapped, one-half cent will be deducted in each event and added to the purse in that event. Paid representatives may shoot for targets only. Events 5 and 7, 50 targets, constitute the event for the W. P. T. L. trophy, a four-man team race. "\$125 added money. The North Side Gun Club will add \$5 to each event both days, and \$5 will be given to each of the five high guns shooting through the entire programme. Average money; open to all. Shells shipped prepaid, care of Chas. G. Grubb, No. 507 Wood street, Pittsburg, Pa., will be delivered to shooting grounds free of charge. To reach shooting grounds take Brighton road car, corner of Liberty avenue and Seventh street; get off at Davis avenue, and walk to the right."

The programme of the Missouri State Amateur Shooting Association's thirteenth annual tournament and convention will be sent to applicants by the secretary-treasurer, Mr. F. B. Cunningham, St. Joseph, Mo. The dates are Oct. 8-10. The first two days will be devoted to targets, twelve events each day, eight at 15 and four at 20 targets; entrance \$1.50 and \$2, and added money, \$5 and \$7. On the first day the two-man team contest for the L. C. Smith trophy will be the special feature. It is open to amateurs of the Association; 25 targets and \$2.50 entrance per man. On the second day the special event will be for a trophy, 100 targets, open to amateurs of Missouri, Kansas, Iowa and Nebraska State organizations. The third day is for live-bird competition. Event A is for the amateur State trophy, 15 birds, \$10 entrance, bird included, 30yds. rise. Event B, sweepstake, open to all, 25 birds, \$20 entrance, birds included; handicaps 20 to 32yds. Shooting commences at 9 o'clock. Targets 2 cents. Live birds, 25 cents. Rose system, targets and live birds, 7, 5, 3 and 2. "Guns, ammunition, etc., forwarded by express or freight, must be prepaid and billed to F. B. Cunningham, and shipped in care of the Brown Transfer and Storage Company. Duplicate bills of lading should be sent him, and all shipments will be delivered to grounds free of charge."

BERNARD WATERS.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Sept. 23.—The wind, blowing a gale from the north, raising the targets straight up in the air, it seemed, for half a mile, made hard shooting, and good scores were scarce to-day.

The event for the Marshall cup was well contested, three men. Traver, Perkins and Roberts, tying on 22 for first place.

In the next event Traver and Perkins each broke 23, but Perkins, having the advantage of a handicap of 2, scored 25, which made him the winner.

Scores follow; handicaps follow names:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	10	10	10	10	10	10	10	10	10	10

SNANIWEH.

Topeka Gun Club.

TOPEKA, Kans., Sept. 26.—Yesterday on the grounds of the Topeka Gun Club a live-bird shoot was programmed, in which six members participated. The afternoon was cloudy, and a stiff wind blew from the shooters to the traps, helping the birds wonderfully in their get-away. The pigeons deserve mention, inasmuch as they were a wonderfully tough, strong lot. They kept the shooters guessing, and J. Hill deserves great credit for his performance, as he shot a 20-gauge with but 2 drams of smokeless powder. The star performer was Mr. L. Biscoe, who struck his gait early, and kept his wonderful form throughout the shoot. He shot a 12-bore and ammunition of his own loading, with 3 drams of smokeless powder and No. 8 chilled shot. He drew his share of more than difficult shots, but it made no difference to him, and he centered the birds well, cutting them into rags time after time with the first barrel. He used his second but nine times. On the other hand, J. J. Gorman, considered by the club

as infallible, had the worst streak of missing ever witnessed on the grounds. He came without his gun, and shot every gun he could borrow, trying to find a happy medium. Also, his loads were defective, and unsatisfactory. They were factory loads of a popular brand, but evidently were aged and were undeniably slow. Gorman is standing a large amount of "joshing" just now with great fortitude. Hungate drew some corking birds, and his score of 19 out of 25 means some pretty good, hard shooting.

Only a man in perfect form could have won out with those pigeons, and the hard conditions. Five traps were used, the rise was 30yds., with 80yds. boundary. Biscoe's lost bird was dead out of bounds, hit hard with both loads. It spoiled a perfect score; but it wasn't his fault. The scores:

J. J. Gorman	220021110011001*001101121—15
L. Biscoe	1211221111020112*20121211—24
O. E. Hungate	0211221111020112*20121211—19
J. Hill	201010101102102121002120—16
Doc Williams	011112210020001112011*21—17

CHAS. H. MORTON.

Pawtuxet Gun Club.

PAWTUXET, R. I.—The main contest was for the State championship cup, in the challenge shoot, held on the grounds of the Pawtuxet Gun Club, Sept. 19. Mr. Joseph Armstrong was the preceding holder. There were fifteen contestants. Mr. Hugh B. Bain, of the Pawtuxet Gun Club, is now the State champion of Rhode Island and holder of the championship cup. He tied with Eugene C. Griffith, of the Pascoag Gun Club. Griffith did not care to shoot off the tie, and surrendered his claim and the title that accompanies the possession of the cup. Bain had challenged Joseph Armstrong, of the Pawtuxet club, the former holder of the trophy, and this shoot was the result.

The match began at 2 o'clock, and consisted of five races of 20 targets each. There was no limit to the number of shooters allowed in the event, so it was made the afternoon's shoot of the club's programme. There were several practice events.

Griffith opened with a clean score. Bain missed one in his first string, two in the second, three in the third, two again in the fourth, and finished strongly with 19 for his fifth string, a total of 91. Armstrong, who held the trophy, was sixth in the list, breaking 16 in each of his first three strings, missing but two in the fourth string, and breaking but 11 in the last string, for a total of 79. He was beaten by W. H. Sheldon, who also fell on his last string, making but 14 for a total of 82, and by H. Barstow, with 83, and Sherman with 84. The scores follow:

Bain	19	18	17	18	19	91	Winsor	17	15	15	16	15	77
Griffith	20	19	18	18	16	91	Montieth	18	13	14	18	11	74
Sherman	17	16	18	18	15	84	Scott	15	15	14	15	14	73
H. Barstow	15	17	18	18	15	83	Lambert	17	15	15	15	9	71
Sheldon	16	18	18	15	14	82	Ray	11	10	16	16	17	70
J. Armstrong	16	16	18	18	11	79	Johnston	15	12	11	13	14	65
Mead	14	12	18	17	17	78	Morris	14	12	15	11	11	63
W. Barstow	15	15	19	15	14	78							

The shooting was all at 16yds. Some of the runs made were unusually good.

Harrisburg Shooting Association.

THE Harrisburg, Pa., Shooting Association, one of the oldest shooting organizations in the State, if not the oldest, will hold their seventeenth annual tournament on Oct. 9-10. They are making unusual preparation this year, and expect to have the largest shoot in the State this year, excepting the State shoot. The different events will be shot from two magautraps. Special arrangements have been made to transfer the shooters from the trolley line to the shooting park by stages that will run every half hour. A caterer has been engaged to attend to the wants of the shooters. A very attractive programme has been arranged. One of the special features is a team race for \$85 in cash, open to teams of four men from any gun club in the State. Men shooting on teams must reside in the county that their club is located in. Any club can have two or more teams if they wish, but no member can shoot on more than one team. The \$85 will be divided 40, 30, 20 and 10 per cent. among the four highest teams.

There will also be a cash prize of \$10 to high gun shooting through the programme the two days, open to amateurs only, and \$5 to next to low gun.

The shoot will be under the management of Mr. Frank Lawrence. The programme, which is a very neat little booklet, has embodied in it the game and fish laws of the State, and will be sent to shooters who intend attending the shoot. Address Mr. A. H. Roberts, secretary, corner Fifth and Camp streets, Harrisburg, Pa.

Winchester Gun Club.

WINCHESTER, N. H., Sept. 26.—At the Winchester, N. H., Gun Club tournament, held Sept. 24, the fine cup that the Peters Cartridge Company gave to the State of New Hampshire as a championship trophy at 100 targets, was the principal race of the day. This was a hot race from start to finish. The competition was under the worst of conditions of shooting; the day was dark and very cold, with a fierce wind, and the speediest of targets trapped.

The trophy was won by L. R. Nelson, Winchester, with a score of 84. J. W. Dickerson, Ashuelot, was a close second with a score of 83. Mr. Dickerson put up a gamy fight to the finish, the scores being tied at 97 shots.

Winning this trophy gives Mr. Nelson the State championship, and he also holds the State record at 100 targets, 95, made last season. This trophy is subject to challenge any time by any man in New Hampshire. The price of targets is the only fee charged for shooting for it.

F. D. LESURE, Sec'y.

Girard Point Rod and Gun Club.

PHILADELPHIA, Sept. 26.—On the grounds near Point Breeze two events were shot. One at pigeons and one at crows. In the pigeon shoot, Mr. Edward Kelly killed 9 out of 10. The crows seemed to be a more difficult proposition, if one is to judge of it by the scores:

First event, 10 pigeons, 28yds. rise:

Kelly	2112111110—9	Emmons	1110221022—8
Willis	1210011212—8	Goddard	0222102201—7
Corrigan	1012120112—8	Avery	2022020202—6
Roletter	2012012212—8	Hubley	2220020202—6

Second event, 10 crows, 28yds. rise:

Roletter	2220121022—8	Goddard	1220020220—6
Emmons	0222222102—8	Kelly	0220211002—6
Willis	2202102120—7	Hubley	2012020222—6
Corrigan	0222012021—7	Avery	2202002200—5

The old farmer and his wife had agreed to separate. They had only one child. "Everything friendly?" inquired a neighbor. "Oh, yes," replied the old man, carelessly. "No trouble about making a fair division of the property?" "Oh, no. She gits the kid an' the canned fruit, an' I git the pig an' the apples. That's even enough, ain't it?"—Chicago Post.

Indianapolis Gun Club Tournament.

INDIANAPOLIS, Ind.—The dedication tournament of the Indianapolis Gun Club was an unqualified success. There were manifested a most friendly feeling for it and for its entire success from its inception. All speak in high praise of the club as an organization and of the tournament as a good and interesting competition. Of the famous American team which defeated the Englishmen and Scotchmen in Great Britain not long since, seven were present, and Mr. Ernest Tripp, who was a member of the team, gave a banquet in honor of his fellow members on Monday evening.

The new club house and grounds were much admired for their completeness, and the general equipment for competition was perfect.

The moneys were divided as follows: 20-target events, 30, 25, 20, 15 and 10 per cent.; 15-target events, 40, 30, 20 and 10 per cent.

Sept. 22, First Day.

The famous expert, Mr. W. R. Crosby, was first average in the day's programme with 195 out of 200. The professionals had a purse of \$50 hung up for them, but they were debarred from the sweepstake moneys.

For the English Hotel cup three events, Nos. 4, 8 and 12, each target day, were shot. They aggregated 100 targets. Messrs. Heer, Hirschy, Spencer and Le Compte scored 192, a percentage of 96. Peck, Powers, Sunderbruch, Budd and Hughes scored 190, a percentage of 95. Crosby, Heer, Hirschy, Budd, Hughes and Spencer shot from the 16yd. mark. Le Compte from the 18, Peck 17, Powers 19, Sunderbruch 17.

C. O. Le Compte, of Eminence, Ky., led in the contest for the English Hotel cup. He broke 50 straight. George Roll, of Chicago, scored 49; C. H. Peck, Remington, Ind., 48; Ed Voris, Crawfordsville 47.

There was a large attendance of spectators, many ladies gracing the shoot by their presence and interest. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	15	20	15	15	20	15	15	20	15	15	20	15

The conditions governing the cup, won by Geo. Roll, are as follows:

The English Hotel management has generously donated to the Indianapolis Gun Club, for competition by amateurs, from the States of Indiana, Ohio, Michigan, Illinois and Kentucky only, a beautiful sterling silver cup, to be known as the English Hotel Cup, and under the following conditions: The cup to be first shot for at the dedication tournament of the Indianapolis Gun Club, Sept. 22, 23 and 24, 1903. The initial contest to be decided in events Nos. 4, 8 and 12 of the first day, and events 4, 8 and 12 of the second day, a total of 100 targets. Interstate revised rules to govern. In case of a tie, contestants to shoot off tie at 25 targets. Each contestant in tie to pay for his own targets. The winner will be required to give approved bond for the safe custody of the cup. Any amateur residing in either of the five States named may challenge for the cup by sending \$10 forfeit to the secretary of

the Indianapolis Gun Club, Indianapolis. If the directors of the club consider the challenger eligible, they will immediately notify the holder, who will accept within ten days of the receipt of the challenge, forward \$10 to the secretary, and name a date for the match, within thirty days of the acceptance of the said challenge. Should the decision be against the challenger, his money will be returned. On the day of the match each party will put up an additional \$10, the winner to take the trophy and the stake. In all contests for the cup, at any but the annual Indianapolis Gun Club (cup contest) tournament the two contestants shoot from the 16yd. mark and at 100 targets, unknown angles, per man. In case of a tie, contestants will shoot at 25 targets, unknown angles, each, and repeat until the match is decided. The settlement for the targets will be arranged by the contestants. Should the holder fail in any of the above conditions, the cup is forfeited to the challenger. At the regular annual (cup contest) tournament of the Indianapolis Gun Club the holder of the cup must deliver same to the club officials for open amateur competition, and on the same plan as the initial contest. No challenge will be considered after the holder has been notified to return the cup for the annual tournament. Any question arising not clearly set forth in these conditions to be referred to the board of directors of the Indianapolis Gun Club. All contests for this cup must be settled on the grounds of the Indianapolis Gun Club.

Sept. 24, Third Day.

The third day was devoted to competition at sparrows. To the shooter making the highest general average of the programme the Indianapolis Gun Club presented a beautiful trophy emblematic of the sparrow championship of the world. The list of entries was large, and in consequence, two of the programme events were cut out. The great shot, Mr. W. R. Crosby, of O'Fallon, Ill., won the sparrow championship. Snyder, Stilwell and Snipe were tied with Crosby after the regular programme had been finished, each with a score of 67 out of 70. McStilwell, of Crawfordsville, in the last round seemed to be a sure winner, but he missed his final bird, and thus dropped back to 67.

In the shoot-off Crosby's opponents each killed 14. It was the most stubbornly fought contest at sparrows that has been witnessed in years.

Crosby was greeted with a cheer from the shooters present when the race was decided.

The Indianapolis Gun Club officers and members were roundly congratulated by all of the shooters present. All agreed the ground is an ideal one for the Grand American, and every visiting shooter who faced the traps is an ardent supporter of the movement to bring this event here. The scores follow:

Events:	1	2	3	4	5	Shot
Targets:	10	15	15	15	15	at. Broke.

Interstate at Scranton.

SEPT. 25.—The closing tournament of the Interstate Association series for the season of 1903 was held at Scranton, Pa., Sept. 23 and 24, under the auspices of the Scranton Rod and Gun Club, and it was even more successful than had been anticipated. There were forty-eight different entries the first day and thirty-two the second day, and over one thousand persons witnessed the shooting the afternoon of the first day, the crowd being so large that it was difficult for the contestants to get to the firing points at times. The second day of the tournament was cold and dreary, with every indication of rain, and this kept down the attendance. One set of traps, Sergeant system, was used, and the targets were thrown 50yds. The background was very poor, and some of the scores made do not look well in print, especially when you generally see straight scores recorded for these same contestants.

The first day, among the manufacturers' agents, J. A. R. Elliott was high with 163 out of 175 shot at. L. J. Squier was second with 161, and J. M. Hawkins and E. D. Fulford were third with 158. Fred Coleman was high amateur with 155. Harris was second with 150, and Shoemaker third with 146.

The second day Elliott was again high man of the manufacturers' agents with 163, Squier second with 157, and Hawkins third with 154. The high amateur was Harris with 140, Coleman second with 137, and Fen Cooper third with 136.

The trade was represented by Messrs. Frank Lawrence, J. M. Hawkins, Neaf Apgar, E. D. Fulford, L. J. Squier, Sim Glover, H. H. Stevens, J. A. R. Elliott, J. R. Hull, Capt. A. W. Money, Edward Banks, T. H. Keller, Geo. Benjamin and O. Stull.

The scores of both days follow:

Sept. 21, First Day.

Events:	1	2	3	4	5	6	7	8	9	10	Shot	at.	Broke.
Targets:	15	15	20	15	20	15	20	15	25	25

Scranton, Pa.—Delightful weather and a large attendance of both shooters and spectators marked the opening day of the Interstate tournament held at Scranton, Pa., on Sept. 23 and 24, and the thousand people present enjoyed themselves from Manager Shaner's "little speech" in the morning till Fulford's hat disappearing in the dim distance in the evening.

The trade representatives present were Messrs. Apgar, Squiers, Hawkins, Hull, Glover, Stevens, Elliott, Money, Fulford and Keller, with Frank Lawrence and Ed Banks on the side, the former to show the merits of the "patter gun."

The scores were good, but not phenomenal. High average was made by Elliott. The entry of amateurs in the money events was large, and it was 5 o'clock before the schedule was finished, Coleman carrying off the honors with a score of 155 out of a possible 175.

On the second day a gale of wind and a cold, raw temperature dampened the enthusiasm considerably, about half as many being present as on the first day; but those who did come saw some fine shooting by the professionals. No one could tell whether a target was going to skim along the grass or climb—the writer will make an affidavit that some of them did both—yet it made no perceptible difference in the scores of the visitors. Elliott again led with 163 out of a possible 175, the same score as he made on the preceding day, Squier and Hawkins, in the order named,

being close behind. Among the amateurs the entry was lighter than on the first day, and a number did not finish the events.

"They couldn't hit em, and what's the use." Mr. Harris was high man with a score of 140. The regular schedule was finished at 3 o'clock, and the balance of the day devoted to practice shoots.

This was the first Interstate shoot held in this section, and aroused a great deal of interest. Not a hitch or delay of any kind occurred—probably there couldn't under Mr. Shaner's management—and yet we'll know how to run the next one better.

Perry County Tournament.

SEPT. 26.—The Perry County Shooting Association held their regular monthly shoot at Duncanon, Pa., Sept. 26. About forty shooters participated in the different events. There were shooters present from Marysville, New Brunswick, Newport, Loysville, Landisburg, and Duncanon. About eight hundred spectators came out to see the shoot. The trade was represented by Mr. Frank Lawrence and Mr. J. M. Hawkins.

The individual championship trophy, emblematic of the championship of Perry county, was won by Mr. W. L. Alexander, who shot a tie off with Messrs. Owens and Diebold.

Dr. Morris and Mr. McKling tied with 14 each for the Ithaca gun. In the shoot-off, miss-and-out, Dr. Morris won. The five-man team race scheduled to come off started so late but two teams could enter; other teams that expected to enter had to leave to catch their train. The two teams that shot were Duncanon and Marysville. Teams of five men each, shot at 15 targets per man, Marysville winning by a score of 63 to 49. The next shoot of the Association will be held at Marysville, Pa., date to be published later.

IN NEW JERSEY.

CINCINNATI, O., Sept. 26.—The cash prize shoot of the Cincinnati Gun Club to-day had nineteen contestants. Mr. Ralph Trimble, from the 22yd. mark, scored 41 out of a possible 50, tying with Maynard, 18yds., and Randall, 16yds. The scores: R. Trimble (22) 41, Maynard (18) 41, Randall (16) 41, See (17) 38, Parker (18) 37, Falk (16) 37, Norris (16) 36, Gambell (20) 35, M. Lee (19) 35, Faran (18) 35, Harris (17) 34, Sunderbruch (20) 33, F. Trimble (17) 33, Roanoke (17) 33, Williams (17) 31, Ackley (16) 29, Jack (17) 29, Herman (17) 27, Jay Bee (16) 24.

Franklin Furnace, N. J., Sept. 26.—At the club shoot to-day the following scores were made. Shooting at 30 targets, Fred Southern broke 16, Andrew Wright broke 21. John Williams broke 20 and Frank Kishpaugh broke 15; each shot at 29. Will Pope broke 9 out of 12. Elmer Blake broke 6 out of 26. Harry Pope broke 13 out of 25, and L. Hawkins broke 2 out of the same number.

Pattensburg, N. J., Sept. 26.—The regular monthly shoot was held to-day. Three tied on 20 in the club event at 25 targets. In the shoot-off R. Stamets was first, N. Stamets was second. The scores:

Edgewater, N. J., Sept. 26.—Event 5 was a shoot-off of ties for silver cup; Glover defeated Eickoff, Truax defeated Morrison. Event 9 was the silver cup shoot, and handicaps apply to that event only.

Troy, Pa.—The tournament of the Troy Gun Club, held Sept. 16 and 17, had a programme whose total was 100 targets each day. Events 6 and 12 on the first day were extra. On the second day events 4, 12, 13, 14 and 15 were extra.

The boys are now working to have an interstate shoot held here, and can guarantee a good time and good accommodations. The following scores were made:

We are informed that at the Williamsport, Pa., shoot, Sept. 16, 17 and 18, all the high averages were made by shooters using Winchester factory loaded shells. Of the expert class, H. L. Stevens, J. A. R. Elliott and J. Fanning broke respectively 463, 462, and 460 targets out of 480 shot at. At the practice shoot of the Charlotte Gun Club, held at Latta Park, Sept. 18, J. E. Crayton broke the amateur record of the South by breaking 96 out of 100 targets from the 29yd. mark. At the Indianapolis, Ind., Gun Club shoot, Sept. 22 and 23, Chauncey M. Powers broke 100 straight, a perfect score, in the preliminary match. Mr. W. R. Crosby missed only four out of 200 targets shot at, and Mr. Spencer missed only 6. All these gentlemen used Winchester factory loaded shells.

People who are interested in yachting know no seasons. In they are not getting their yachts in commission or racing or cruising, they are considering models and plans, or are building their new yachts. That the season for this is at hand, is shown by the advertisement this week of Messrs. Burgess & Packard, Naval Architects and Engineers, who attend to the purchase, sale and alteration of old boats, as well as to the designing of new ones.

The ideal Duck Decoy has long been sought for, and there are few gunners who have not given thought to devising something different, and better, than the old wooden decoys, to which, however, most of us still cling. The Acme Folding Canvas Decoy, manufactured by the St. Louis Manufacturing Co., seems to possess very useful qualities, and the description given of it is very attractive.

THE CONNECTICUT TRESPASS LAW.

It is interesting to observe the workings of the popular mind on matters of game protection as expressed in the acts of various State Legislatures now constantly being passed. Twenty years ago little or nothing of this sort was seen. The Legislatures of the different States then contented themselves with making laws providing close and open seasons for different species of game and fish, and providing also protection for what were loosely termed "insectivorous" birds. But further than this they did not go. A little later, in response to the call of the FOREST AND STREAM, came efforts to prohibit the sale of game—now adopted by most States. Then followed, here and there, efforts to limit the bag, and to prohibit the exportation of game. Meantime the suggestion was raised that non-residents who wished to hunt within a State should pay a certain license, and this, as a ready means of raising money by a tax levied on someone else, became popular and has been adopted in many States. In some States, too, the resident is required to take out a license for killing certain game.

An Act passed last summer by the Connecticut Legislature, although recently quoted in FOREST AND STREAM by a correspondent, has not attracted general attention, nor have its bearings been fully understood outside of the State. As is well known, Connecticut possesses a great number of towns, large and small, many of which are devoted to manufactures. These towns are usually within easy reach of country districts where there is more or less shooting and fishing; or, at least, where there is open land, with birds and streams, and pastures and woodlands. On their holidays or on Sundays many operatives from these towns, and, to a still greater extent, the foreigners who work on the railroads, or who carry on various small businesses, have been in the habit of spreading themselves over the land, enjoying the country, but incidentally doing more or less harm in their rambles over other people's land by killing song birds, destroying their nests, knocking down fences, and, in their search for the various desirable things, animal and vegetable, which are found in the country, doing much other damage.

This influx of more or less irresponsible strangers has become a great nuisance, and has resulted in a passage of the Act in question, Chapter 199 of the Public Acts of the State of Connecticut, which reads as follows:

Section 1. Every person who shall throw down or leave open any bars, gate, or fence upon the land of another, or who shall enter upon the land of another without permission of the owner, occupant, or person in charge thereof, for the purpose of hunting, trapping, fishing, or taking or destroying the nests or eggs of birds, or bee hunting, or gathering nuts, fruits or berries, shall be fined not more than fifty dollars, or imprisoned not more than thirty days, or both. The possession by any person, while trespassing upon the land of another, of a gun, dog, ferret, or fish rod shall be deemed prima facie evidence of his intention of hunting or fishing thereon.

Section 2. The owner, occupant, or person in charge of the land, or such persons as he may command to assist him, may arrest any person violating any of the provisions of the preceding section, and forthwith take him before some proper authority, who shall, upon complaint of the proper prosecuting officer, proceed to try such person.

Section 3. The owner, occupant, or person in charge of the land arresting any person, pursuant to the provisions of this act, shall be entitled to the same fees that are allowed by Section 4850 of the general statutes to constables for similar services, which fees shall be taxed as costs by the court before which the trial is had.

Approved June 22, 1903.

The obvious purpose of this bill is, first, to protect the land owner. The ways into his property must not be left open. Secondly, trespassing for the purpose of appropriating to one's own use the wild things living or growing on the land is forbidden, and punitive damages, or imprisonment, or both, are the penalty. The implements of fishing and shooting are prima facie evidence of an intention to violate the law. Third, the owner or tenant, or other person representing the owner, is clothed with

the powers of a constable to arrest anyone violating the law, and to see that he shall be tried for his offense, and this person making the arrest is entitled to the regular fee of the constable for a similar service, and this fee is to be included in among the costs of the trial.

The open season for upland game in Connecticut began October 1, and there has thus been little opportunity to judge as to how this law will work. It is interesting to learn, however, from the testimony of residents of Connecticut that during the first few days of the open season there has been, on protected land, and in its vicinity, very much less shooting than is commonly heard. In the past such shooting has largely been at squirrels, chipmunks, bluejays, and other small creatures, and probably has not done much toward reducing the game supply; but, on the other hand, it has been very annoying to land owners to be constantly obliged to follow up shooters and to warn them off the premises. Sometimes, too, shooters are impudent, and refuse to move away. At other times they appear to be foreigners, and not to understand what is said to them. If the existence of this Act becomes generally known throughout Connecticut, and if it appeals to the hard common sense of the average Connecticut farmer, it will undoubtedly do much to reduce the amount of powder burned in that State, and may well enough result in a very considerable increase of the State's game supply.

All these expressions of the popular will as to game and fish in the various political divisions of the country are well worth noticing, for each one has a direct bearing on the general situation in which the sportsman is so greatly interested. The present tendency of legislation is in the right direction, and while things may not move so fast as we would like, yet by their legislation the Federal Government and the States alike are constantly working toward better things.

It may confidently be said that had a law such as this been passed by the Legislature of New York State, certain atrocities which have recently taken place in the Adirondacks could never have happened.

OCTOBER DAYS.

THE birds are on the move. Night and day, through the golden mist of autumn sunshine, through the silver silence of the crystal-clear night, they slip joyously along the "King's highway." Often an observant eye may even detect the bee-like dash of a tiny hummingbird, as it mingles its flight with the flitting warblers and sparrows. In the chill of the morning, while the sunlight is struggling through the earth mist that so persistently clings to the lower levels, the bluejay appears to be the whipper-in, as it were, for it is his squalling voice that wakes the sleepy echoes and rouses the sluggish life that has apparently slackened in its quick flow through the veins of the tired host. Later, when the sun is in control; when the keen air has lost the sting of the early hours, every bushy lee that lies open to the genial warmth will have its little gathering of merry travelers, rustling the short grass or stretched with half-closed eye and extended wing in the delicious abandon of a sun bath.

Very charming to watch are these little circles where each individual appears to give itself up entirely to present enjoyment. The cosmopolitan make-up of these bush parties is striking. One will see the members of the aristocratic thrush family jostling with all comers in friendly contest for the warmer spots on which to bask. Often an autumn leaf loosing its slight hold on a nearby tree will drift down on the light air, till, reaching the eddy that draws about the copse where our little friends are resting, it loses its impulse to pass, and pitches with a zig-zag lurch to the midst of the happy company. To see a tawny thrush seize the flaming bit of color and scamper to one side, where he holds himself proudly erect, with slightly raised crest, as though he would say, "Who shall dare?" is to look upon a picture of real life such as is found only in nature's gallery; it is beyond reproduction; brush work would be an insult here.

While every sheltered bit of woodland is holding its little carnival of migrants, the dun meadow and reedy marsh likewise offer a widespread welcome to their visiting patrons. Ducks are trailing in long lines, and again in compact flight across the blue sky as they dart in rapid course high above the marshes drowsing in the purple haze of this perfect day. Far away where the glisten of a sandbar mingles with the shimmering water,

the gray geese are pruning and readjusting their plumage after the night journey just ended. An occasional honk! honk! faint, tuneful, a dream-voice one might say, floats in the quiet air, while from the uplands the call of plover and meadowlark are full of peaceful suggestion. Even the wandering crow flaps silently along, as though ashamed to utter even a single discordant note. The pools that dot the marsh land here and there have each its quota of bird life. Yellow-leg, black-breast, dowitcher, all are present, for the tide is sweeping the mud flats and the myriad gleaners that find their food in such localities must retire before the sweeping flood. So here, gathered about the margin of the quiet pools, they rest and preen, and bask the golden hours away. Here also is music, pitched in the minor key beloved of all shore birds. Unlike the joyous twitter—odds and ends of spring songs—that sound in subdued tones among the bushy borders of the marsh land, these minor calls seem full of pathos. As the eye ranges over the quiet scene the tall figure and sentinel-like pose of a solitary blue heron looms enlarged in the purple haze. Presently his broad vanes are spread in indolent motion as he starts in a seemingly aimless flight far away over the dun marsh. There is silence here. Bird voices and the soft swish! swish! of wings are not noises!

SUBSTANTIAL results are promised from the convention of fish commissioners who met in Boston the other day to consider ways and means for the preservation of the lobster. The reason of the lack of a well thought out and consistent scheme of protection for all the Atlantic lobster waters is found in the fact that in the past there has been no concerted effort on the part of the States and Provinces interested. When lobster legislation came up in the Massachusetts Legislature last winter, the chairman of the Fish Commission, Capt. J. W. Collins, very sensibly and with foresight suggested instead of immediate amending of the laws, a provision looking to the convention which has just been held, to the end that data might be secured for wise legislation and such co-operation assured as would give any adopted system of protection a wider application than to Massachusetts waters alone. The end has abundantly justified the wisdom of Chairman Collins' suggestion. If the convention did not settle the questions at issue, it did point the way to an ultimate solution. The measures urged by it will undoubtedly be adopted by the several States; and when the system of licensed fishermen, a uniform length, long or short, and a sale limited to the lobster in the shell, shall be in operation, we may look to see the restoration of the lobster. In addition to the recommendations adopted, a close season should be provided. As President Reed, of the Massachusetts Association, showed, it is exceedingly difficult, if not impossible, to entirely prevent the sale of short lobsters while lobster fishing is permitted. Once make a close season when no pots shall be put out on the lobster grounds, and the sale of shorts will be promptly ended.

THE official statistics just published of the fatalities in India in 1902 caused by wild animals and snakes show that there were in the year 2,836 deaths of human beings from wild animals, and 23,166 deaths from snake bite. Beside this appalling destruction of human beings, the killings of cattle are of comparative insignificance, although they numbered not less than 80,796. A persistent warfare is waged upon the savage powers that prey; bounties were paid during the year for the destruction of 1,331 tigers, 4,413 leopards, 1,858 bears, 2,373 wolves, 706 hyænas and other species, making a total of 14,983; and the snakes destroyed were 72,595. As one reads these returns he may well indorse the sentiment of the Kansas man, who, having returned home after making the grand tour of Europe, declared contentedly, "Kansas is good enough for me."

WHEN a moose was killed in the Adirondacks the other day the deed was ascribed to wantonness. It is some satisfaction to learn that the shooting was done by a hunter who mistook the creature for a deer. This cannot be accepted as a sufficient excuse, but it is one which speaks more favorably for the human nature involved. The moose killer was a poor man who works as a day laborer; and it is said that he will have to serve a term in jail to work out the fine of \$200.

The Sportsman Tourist.

A Day's Hunt in South Africa.

WE had made a camp on one of the small tributaries flowing into the Pungwe River from the north. The main party had moved forward, and I had been left behind to send on meal, etc., for our carriers on their returning. This gave me ten days in which I had nothing to do, and being in one of the best game districts south of Zambesi, I filled the time by morning and afternoon hunts, and making the meat into beltong. Beltong is made in the most approved manner as follows: First shoot the buck; then, if a large beast, quarter and bring to camp. When at camp take out each muscle whole, and rub in a little coarse dry salt. Then make trestles about three feet off the ground, spread the meat carefully on these so that no two pieces come in contact, and half dry with a smudge fire. Then hang up to thoroughly dry and pack away in bundles or sacks.

The gang of "boys" (all male natives are termed "boys" even though they may be gray haired old men) numbered eleven, and included my own six personal servants. We had also a guide from a neighboring kraal (village) who knew the locality well and the likely places to find game. My usual way of hunting was to take the guide in front and have four to six follow on just within sight or call. The guide was a good one and a trained hunter, and an unusually plucky native.

It had become light and the guide had not turned up as he should have done half an hour before, and so I started off without him. There was but slight wind and that from the usual quarter, east-southeast. As I had already spent a week at this camp I knew the country locally better than my camp boys, consequently I went on ahead, and all the others strung on behind. Soon the first stream was passed and we were well away from camp and camp noises. I looked up the clearing where three sable antelope had been bagged, but drew a blank. Next the dry vley (marsh valley) where I had just shot a buffalo, but nothing was found in it. Evidently the game had moved further away, so I struck out due east for fresh grounds.

Suddenly a bush buck sprang out of cover, and as he stopped for a second look, as most African bucks do, I put a quartering shot into his flank and kidneys and he dropped dead. With a kidney shot a buck drops in his tracks at once; it is more sudden than even the heart. The bush buck is a fine antelope of about three feet height at the withers, and has very pretty, graceful horns, sharp and dangerous to dogs. As a rule, it does its best to escape if wounded, but sometimes it will take cover in a bush and make a sudden attack if followed, and a few hunters have been killed or badly wounded by following up incautiously.

As this was a very poor morning's bag I continued on, crossed two more streams, and got into a district none of us had hunted in. A couple of miles further and I became hungry. My tin of cold stew was produced and I sat down on a fallen branch to put fuel in my furnace. As I was eating, one of my boys, a Delagoa Bay native, came to me with eyes open very wide and in a stage whisper said "Injobvu, boss, injobvu," but injobvu was not in my vocabulary, for I was not familiar with the lower South African native tongues, and, excepting that this injobvu was mighty important I had no idea. I reached for my rifle (a .303 British cal. Winchester, '95 model), and looked. My mind was soon cleared of doubt as to what "injobvu" was, for about 100 yards distant, and coming diagonally toward and past me, were a troop of elephants. My rifle, magazine and chamber, was loaded with split bullets, and the bag with my spare ammunition was not at hand. Luckily, however, I had sewn on my belt canvas loops to hold six cartridges (three .303 and three Martini-Henry), and three were holding solid .303. Carefully and quietly I extracted three split bullets from my rifle and put in the three solid, and shifting off the branch and on to the ground I waited. "Buck fever" days had come and gone, and a lot of hunting and matches on the rifle range at military targets had given me confidence and trained me to steadiness.

Many the time had day dreams of shooting elephants by the half dozen filled my brain, and the knowledge I had from such books as "Rowland Ward on Big-Game Shooting," and Sellows' "Wanderings of a Hunter," made it seem quite easy. The three fatal shots were, I knew, the brain (if you could get at it), the knee, which dropped it so that it could not rise, and the heart. R. W. and S. both said that in the African elephant the heart was at the tip of the ear when it was laid back on the shoulder, so of course that was where in day dreams I had knocked them out of time. But these did not work properly. The exact place the brain was did not seem at all certain; the knee was bobbing about so as to be anything but an easy shot, and the tip of the ear was "all over the place," for it kept swinging to and fro like a large fan. Though all this takes a long time to write, the events passed much more rapidly, for the elephants were walking along at about four miles an hour. Well, I made note of the place where the heart should be, and pulled the trigger. All had been going as quietly as Sunday in a Quaker village; but Sunday was over. The hit elephant swung round on its hind legs and screamed in rage and terror; but it looked the wrong way and could see nothing. As it swung back I fired again; it tottered and fell down, head toward me. A big bull, the boss, came rushing up from the rear guard, had a hasty survey of the fallen member and swung about and went crashing away, the others following, while I sat waiting with my last solid bullet to finish the fallen beast if it attempted to rise. How I have regretted this; for had I known then, as now, that an elephant that falls to a shot never rises, I might have had old gran'daddy also. When I looked round for my boys none were to be seen. As the elephant was evidently dying, I got up and went to it, keeping well out of reach of the trunk, for its eyes were watching me. The boys were called and came from cover, the Delagoa Bay boy wild with excitement. He begged so hard that I let him shoot at it with the Martini-Henry. He put a shot in just below the sternum, and a steady spout of blood rushed out. As the poor brute was gasping and groaning, I put a bullet into the brain from the top of its head. The distance

was just 48 yards from where I shot and it fell. It was a cow with a calf, but as the calf had cleared off with the troop, it was old enough to look after itself. The tusks averaged 25 pounds each.

Two boys were dispatched to camp and to the kraal, and the remaining four made me a camp and commenced to cut up the meat. The two shots had entered in about two inches from each other, the first going through the heart and resting on the inside of the rib opposite, and the second taking a forward course cut the large artery under the upper fore leg. I had given instructions to the boys to be careful and cut out the bullets, and was greatly puzzled when they brought me three. On careful examination I found that the one that had gone in obliquely had slipped out of its nickel jacket. Both jackets were slightly turned over at the base. These bullets I sent to the Winchester Arms Company, together with a short account. Late at night my camp gang turned up, and early next morning the kraal natives, and all day there was cooking, with hacking and quarreling, and at night all the meat had not been cut off. When I left next morning there were still ribs and a leg to be cleaned.

Sections of the trunk make capital steaks, but the tid-bit is the foot. This is plastered with mud and roasted in a hole under a big fire for eighteen to twenty-four hours, then the mud and skin knocked off and the pad can be taken out with a spoon. The tongue is also good if well boiled. The meat of other parts is tough and rank.

While on the subject of hunting in Africa it may be of interest to add a few remarks as to camps, hunting togs.

First of all, hunting in Africa is conducted in a way quite impossible to say a moose hunter in the Mat-tawa district, where in the '80s I used to have a few weeks of hunting with my father each winter, making a lumber camp our base. There weight had to be cut down to one's personal carrying capacity; here in Africa the total weight of camp gear is of little moment, if it does not exceed single pieces of over sixty pounds. In speaking of my six camp boys, only bearers for my tent, stretcher, folding table and stool, water-tight trunk, ammunition, rifles and blankets were taken into account, the provisions being quite another affair, and amounting to five boys for each white man. We had 150 carriers in all, and not enough. The tent was a "Protean" purchased from Cook & Son, Chicago, by order. Readers of FOREST AND STREAM may remember it being advertised by Comstock. I ordered six of the 8 by 8 foot size, and kept two for myself, selling the others. Since I have had made locally two larger flies, cut so as to overlap and to reach the ground. Inside my stretcher is spread, and a mosquito netting hung from pole to back wall.

The stretcher is very simple in design, with no hinges, joints or mechanism to get broken or out of order; it is of the cross-leg type, legs 2 feet long and of 2 by 1 1/4-inch stuff; longitudinal pieces 2 by 2 inches, and 6 feet long. (I'm short myself.) The canvas stands one foot clear of the ground.

The mosquito netting is made of 9-foot wide stuff with a spread of 6 feet 6 inches by 5 feet on the base, and 6 feet 6 inches by 2 feet on top, sewn to a piece of strong cotton of this size (6 feet 6 inches by 2 feet). There are loops at each of the four top corners. The extra length rests on the ground and is covered with sand or earth. On the Zambesi it was too hot for a tent, and so I had the simple net suspended from four punting poles and the stretcher under it, the sand piled on the extra length (about a foot) on the bottom kept the netting from blowing against me. The table gives me a spread of 2 feet 6 inches by 1 foot 6 inches, and stands 2 feet high and has simple cross-legs. In carrying, the top and legs are separate; the stool is an ordinary cross-legged one covered with bush buck hide, and stands 1 foot high. My blankets, pillow and mosquito net go into a roll, and as the stretcher is folded goes on the canvas. This makes only a light load; but as the carrier has other duties, he is entitled to a light load. This stretcher has been in almost constant use for eight years, and has had only to have a broken leg replaced once—this broken through the bearer stumbling and falling heavily.

To return to my camp. Besides my tent, a thatched shade was put up for an afternoon doze. The bearers also put up a hut for the extra meat and another for themselves. In all the low veldt (country) of Africa the grass grows very long and rank, and hunting from March to August is very limited on that account. About August the grass fires are on, and when the new grass sprouts up and until it gets too long, the hunting season is on. About the end of November the rains begin, and by the end of April they are all over. The hot season is from the end of September until the beginning of May.

I have tried all sorts of plans whereby to keep dry and have given it up. Waterproof boots only serve to collect the water. Waterproof coats and trousers are a fairy tale, besides being unbearably hot when the sun gets up. I therefore have gone to the other extreme, and make a business of getting as wet as possible when on a tramp or hunt, and changing to dry things in camp, if what I wear is not already by that time dried by the sun.

My togs for hunting are these:

Foot-gear—A pair of Smith's (of Philadelphia) moccasins for wet weather, and ordinary buckskin Indian moccasins for dry. Thick woolen socks cut off above the boot-top.

Leggins or putties—None at all.

Trousers—Cut off above the knee and loose in leg, and with strong kharkee pockets.

Undershirt—Light wool, low necked, quarter-sleeves.

Shirt—Old flannel cut off above the elbow.

Coat—None, the gun-bearer can take what would go in the pockets.

Head-gear—A cap. Very few people can do this, however, on account of the sun's great heat. My hair, however, is thick and not cut close when on outings, and I have never suffered from the sun.

Socks—One pair extra strong wool socks for wading slippery streams. For crossing on damp or water-covered stones wool socks stick much better than any other foot-gear I know of. Rubber boots are not to be compared with them for the purpose.

Shirts and pants are dyed to a dirty brownish-gray by means of a native bark m'kuti).

The rifles are—One Winchester .303 caliber taking the British Government ammunition. One Martini-Henry sporting, .45 caliber, British Government ammunition of 85 grains powder and 480 grains lead patched with paper.

Sights—On the .303 a Lyman bead No. 24 Jack and a receiver sight. On the Martini-Henry the metal bead sight originally on it and a Lyman rear sight. Both rifles are sighted "dead on" at 75 yards. The .303 does not need elevation to 150 yards, and for distances over 100 yards I use the leaf sights fitted to the Martini-Henry.

For heavy game I would like to add a .50-100 Winchester '86 model, for shooting with the .303 pencil-like bullet is risky at elephant, rhinoceros, or a charging buffalo.

For nearly all shooting I use the .303 with a split nickel jacket cut off at the top to expose a little of the lead. The Martini-Henry is to fall back on and it never fails, though it has had eight years of use and very little attention. Many hunters make it their mainstay. However, as I kept record of a hundred shots and had forty-five kills, and this 100 shots included misses, wounded buck getting away, and shots to put a dying buck out of pain, I consider the rifle quite efficient for our heaviest antelope. The eland goes to over 1,000 pounds.

My stamping ground extends from the Zambesi on the north to the lower Sabi on the south, about 300 miles; and from the coast on the east to long. 33 degrees east on the west. This is nearly all low veldt (country), and from nothing to 1,000 feet above the sea on the flat. Near the coast are large stretches of plains with only a few trees fringing the rivers and pools. Further inland it becomes better wooded and there are low rounded hills and high bald granite peaks with pools. This is the home of the elephant and rhino. Buffalo, and zebras, and many antelopes, lions, hyenas, jackals, and wild dogs are there also. At the edge of the low veldt it is more broken and better watered with small flowing streams. The timber is larger but in it are lovely little opens of various lengths, shapes and widths, and when the long grass is burnt and the fresh grass comes up it is the easiest matter to make a successful early morning stalk and pick a good pair of horns or two.

The hunter has a magnificent list to choose from of over twenty different species of antelope, from the little blue buck of hardly a foot high and with hoofs smaller than one's little finger nail to the sable and eland, buffalo, zebra, and hippopotamus. There are also feathered fowl in abundance, guinea fowl, pheasant, partridge, and numerous ducks and geese. Year by year, however, the game is getting less and less, and soon, unless good game laws shall be made and enforced, it will be the old story of the spring buck on the Transvaal flats and the buffalo on the western prairies, as far as the larger game is concerned. The smaller buck do not seem to be thinning out so rapidly; doubtless the jackals, wild dogs, and leopards are their worst enemies, and the man with a gun is not so dangerous. SHUKALILA-A-GWANZA.

Another View of Kipling's Poetry.

Editor Forest and Stream:

In your issue of Sept. 26 Mr. L. F. Brown criticises Kipling's verses:

"Do you know the blackened timber? Do you know that racing stream?

With the raw, right-angled log-jam at the end,

And the bar of sun-warmed shingle, where a man may bask and dream,

To the click of shod canoe poles round the bend?"

For sixty years I have been familiar with the scenes Mr. Kipling is describing, and I thought when I first read it, and still think the same, that there is no description in the English language which so vividly,

A MAINE LOG JAM.

briefly and truthfully tells the story of logs and water. It is true in every detail to what may be seen in Maine any year. How many places of "blackened timber" I remember, and "racing streams" is the exact term for many streams in Maine and New Brunswick.

Mr. Brown says that "no actual log-jam is 'raw,' 'right-angled,' of 'at the end' of such a stream." Any one who has ever seen drives of logs has seen many places where they jam below a short bend and give the appearance of cutting off the stream completely. The two photographs which I inclose, though not typical of such jams, show the tendency of the logs to rear up at right angles. The word "raw" is just the word to use for such a scene, using it, after Webster, as "not altered from the natural state." The color which one sees in any scene depends so much upon the sensitiveness of the individual that no one could object if a man made out all the colors of the rainbow; but as to the "silver of lichens and green and crimson of mosses" they simply do not exist on a log-jam. The logs are driven the first year they are cut, and they grow no moss on their way down our rivers. If by chance a jam has to be left over one season it must be cleared away the next to let the next cut of logs through, and in case of even the most stubborn obstruction, the bark simply peels off, leaving a smooth, shining surface, which, washed by rain and seared by the suns of summer, offers no encouragement to "green and crimson mosses."

Mr. Brown objects to the "click of shod canoe-poles"

round the bend," asserting that "not one canoe-pole in a thousand in either the United States, India (outside of army equipment), Norway, British Columbia, or any of the maritime provinces of Canada, is 'shod'; and when it is, it does not 'click'; and if it did, even its impact on rocks 'round the bend' would not be heard along quiet water, much less in the tumult and uproar of that 'racing stream.'" The odd circumstance here is that Mr. Kipling is right and Mr. Brown is wrong on every point. I have seen hundreds of setting-poles in Maine, and I have yet to see the first one which was not shod, except in cases where a shod pole had been broken and a makeshift was used till a better could be procured. In the Provinces I have seen poles both "shod" and "barefoot," but the latter were used only because their owners were too poor to buy irons. Then the "click" of a pole telegraphs like the rattle of railroad iron. It can usually be heard from fifty to a hundred yards at the least, unless there is a strong wind blowing, or it is very rough water. I have hundreds of times heard the click of the poles long before the canoe came in sight round the bend. It can often be heard above the roar of the water nearly as far as one's voice could be heard. To any one who has been in a canoe in quick water the "click" of a shod pole is as familiar as the sound of an oar in a rowlock is to a boatman.

Mr. Brown objects to the Indian being called "smoky"; it is the precise word. In my early childhood we used to have from ten to twenty Indian vis-

A MAINE LOG JAM.

itors in a day. Living in smoky camps as they did, their clothes were saturated with the smoke, and, with one's eyes shut, one could have told when there was an Indian in the room. In another way, too, they were "smoky." The smoke darkened their skins. I have often seen white men who, from living in smoky camps, had grown much darker from the smoke-tan.

"Real canoeists and anglers would go to the stream and not to the Indian." But if the Indian was needed to handle the canoe they would probably have to go to the Indian. My experience with Indians has been like Brigham Young's when he sent for Ben Simonds to come and see him, and got for an answer: "When Indian want Brigham, Indian go Brigham. When Brigham want Indian, Brigham come Indian." If one wants an Indian he goes to the Indian.

As for the statements that a "bar is always a deposit of alluvium earth-sediment," and there "never was a 'bar' of 'shingle' * * * to which the word 'bar' cannot be correctly applied," I must sorrowfully assert from much experience in running upon them, that we have the thing even if we do not know the name of it. But as for that matter, the Century Dictionary, if it may be fairly pitted against the Standard—which seems to be Mr. Brown's authority—not only covers this ground by definition 2 of "bar," as "anything which obstructs"; but under 4(a) expressly states that a bar is "a bank of sand, gravel or earth forming a shoal in any body of water." In our swift streams and rivers a bar of mud or fine sand cannot form in most places; only the heavy pebbles can withstand the current. The idea of basking and dreaming "on the bar of sun-warmed shingle" which Mr. Brown ridicules brings up very pleasant recollections to woodsmen. It is a very common thing when tired of poling upstream to haul the canoe out on a gravel bar and lie and bask in the warm sun. "Neither do campers sleep on a couch (bed) of hemlock twigs if they can get spruce boughs; and when they do there is no 'starlight on their faces.'" Now, no man but a greenhorn ever uses spruce boughs to bough down with if he can get anything better; and every other evergreen is better. Fir is most generally used because it is commonly the easiest to get; but hemlock is fully as good. Fir, hemlock, cedar and even pine are preferred to the stiff boughs and prickly needles of the spruce. And as to the "starlight on one's face," one has missed something out of life who does not know what it is to lie out without cover. I can recall many nights when I had no tent above me but the stars.

I would not wish to make any animadversions upon Mr. Brown's criticisms of woods life if I understood that he was confining himself to the region he knows; but I thought it was a general criticism of Mr. Kipling's poem, and I have yet to hear that Mr. Kipling was writing about Sand Lake, Michigan.

If Mr. Kipling had been foresighted enough to label it "Maine" or "Canada," there is no question but he might have been passed *summa cum laude* on every point.

Natural History.

The Advent of Josiah.

ANOTHER citizen of the great West has taken up his abode in New York. Events such as this are not uncommon. The newspapers are constantly telling us of millionaires, who, having accumulated fortunes in California, Colorado, Montana or New Mexico, have hied themselves to New York, believing—we may presume—that in no other place on this side of the Atlantic Ocean, can the surplus revenue be so quickly and easily disposed of. This belief, we think, is founded on fact, for New York City is full of struggling rich who are doing their best to keep their financial noses above water, and to let their wives and children have all they want while they themselves still preserve their business credit.

This new citizen of the town, however, hardly belongs in the category of millionaires. The interest that attaches to him is less financial than political; less economic than ethical. We do not say that he is a statesman; what we do say is that he has associated with statesmen, and who can tell how much of statesmanship he may not have absorbed in this association?

Let us begin at the beginning. Where was he born? What his parentage? What the struggles of his early life? Here is the tale as it came to us from the newspapers. Last spring when the President of the United States was passing through Kansas, he delivered an address from the car platform to the people of Sharon Springs, who had gathered there to meet him. Just as he concluded his address, a little girl in the front rank of the spectators offered him a basket, which proved to contain a tiny badger. As the train moved out, the little girl, anxious to be helpful, shouted to the helpless President, who still held the badger, "Call it J. R."

"Who is J. R?" the President shouted back.

"He is my brother Josiah —" but the last name was lost in the rumble and puffing of the moving train. So it is that Josiah is Josiah plain and simple, and lacks a patronymic.

Being a badger, Josiah naturally has the ways of a badger, and a few people know what that means. If he had happened to be an elephant or hippopotamus, this might have been different, and he would perhaps act differently. Now, he is simply a plain badger, who, under other and less favorable circumstances, would have devoted his life to waddling about over the prairie, digging deep holes in the ground in pursuit of prairie dogs, 13-lined squirrels and other gophers, and robbing the casual bird's nest when he came upon it. But Providence had other plans for Josiah.

After extensive wanderings through the West in the Presidential car, he was brought back to Washington, and for a time lived in the White House. Thence he moved to Oyster Bay, and for many months was guarded by secret service men and others. Incidentally he was a playmate of the children of the President and of their playmates, and all this seemed to agree with him so well that he is now almost a full grown badger. He is absolutely tame, and perhaps as good natured as any badger can be expected to be. Even the most cheerful of badgers always appears to be a pessimist, and acts as though life were going wrong with him; and Josiah, like all his kind, even when playing with the children, wrinkles up his face, turns his flexible nose threateningly in one direction or another, and makes sounds suggesting the suffering of considerable pain. Occasionally, too—when he thinks he has reason for doing so—he grasps the nearest human leg and sinks his teeth into it so deeply as to make marks that last for quite a long time, but we believe he has never drawn blood.

When the President left Oyster Bay this autumn, he made up his mind that Josiah was getting to be too large for the White House; that there was not room enough for him in the edifice unless the President's family should move out. It was determined, therefore, to transfer him to the New York Zoological Society's Gardens at the Bronx—since these grounds are more roomy than those of the White House; so Josiah was turned over to one of the attendants of the Zoological Park and was transferred to quarters there, which he will continue to occupy.

It may be questioned whether Josiah's life at the Bronx will be what it has been for the last six months, and we imagine that often as he is running around his cage, gazed at by thoughtless and not too intelligent visitors to the Zoological Park, his mind will revert sadly to the happy days on the pleasant hills at Oyster Bay, when he was the pet of the President's children.

Audubon Society Annual Meeting.

THE following notice has been issued by the chairman of the American Ornithologists' Union committee for the protection of North American birds:

The annual business meeting of the National Committee of Audubon Societies will be held Wednesday evening, November 18, at 8 P. M. at the residence of Mrs. Edward Robins, No. 114 So. Twenty-first street, Philadelphia, Pa.

The joint meeting of the American Ornithologists' Union and of the several State Audubon Societies will be held on Thursday afternoon, November 19, at which time the report of the National Committee will be presented. The place of the meeting will be announced later.

WM. DUTCHER,

Chairman.

The New St. Petersburg Mammoth.

FREQUENT reference has been made in FOREST AND STREAM to the carcass of the mammoth discovered in Siberia some years ago, and from time to time we have noted the progress of the expedition, organized by the St. Petersburg Imperial Academy and led by Dr. Otto Herz, which set out for the scene of the discovery with the purpose of securing the carcass and transporting it to St. Petersburg.

It will be remembered that the mammoth was found on the banks of the river Beresowka, a tributary of the Kolyma, in the Province of Yakutsk, after a landslide, which entirely exposed the great head. Soon after its discovery the inhabitants of the village near by took away one of the tusks, while foxes, dogs and other carnivorous animals gnawed away the flesh. As soon as the Governor of the Province learned that the carcass had been found, he protected it until the arrival of the St. Petersburg expedition. The carcass was partly buried in ice and partly in sand and gravel, and was so covered with earth that it did not thaw at all.

Dr. Herz began his excavations from the front, and found the fore legs widely spread and bent at the wrist, and the hind legs turned forward under the body. The mouth was filled with grass, and the well preserved tongue was hanging out of the mouth. The chest cavity of the animal was full of clotted blood, and it has been concluded that the animal fell into a hole, and, while striving to escape, burst a blood vessel near the heart. It has been ascertained that the ice surrounding the carcass was not of a river or lake, but was formed from compacted snow, and it is concluded that the mammoth, while grazing over a meadow which formed the thin

THE SIBERIAN MAMMOTH.

covering of a glacier, fell into some crevasse that was hidden by the loose earth, and perished at once.

The remains, which have now been mounted in the Zoological Museum of St. Petersburg, show the animal as he died and was found. The frozen skin has been carefully prepared, the skeleton and all the soft parts that could be saved have been taken from the skin and preserved separately. The skin of the head and ears, which had been destroyed, has been copied from the specimen obtained from Siberia about one hundred years ago, but, apart from the head, the skin is nearly perfect, and it was found necessary only to add in one or two places wool and hair from other specimens. It is to be noted that the tail was well preserved, and that it bears at the tip the tassel of long black hair. The mammoth is a young male and not a large one.

The discovery and subsequent inspection of this specimen at the Zoological Museum at St. Petersburg has led the director, Dr. Salensky, to make a careful scientific investigation of this specimen, as well as to show all that is possible of it. His studies will be published in the series of memoirs which will appear from time to time; the first—that dealing with the skeleton—having already been issued. Unfortunately these memoirs are written in Russian.

Quail in Town.

MORGANTOWN, W. Va., Oct. 1.—*Editor Forest and Stream:* Yesterday a flock of quail came right into the heart of our city of ten thousand population, and, becoming scattered, alighted on shade trees along the principal streets, and for quite a while amused and interested throngs of people by their calls to one another, being scattered over a whole block. They could be seen in the trees not over ten feet above the pavement where people were passing continually, and seemed to have little fear. Many people did not recognize the call which they utter as being that of quail, being only familiar with their Bob White call; thus many had a practical lesson in ornithology right at home. To-day the same flock, no doubt, were scattered through the campus of the university, making the autumn air ring with their calls, which almost made one feel that they were away out in some good quail cover, and it produced a pleasing sensation and diversion in city life. It suggested to the writer that if those who shoot could only forego the gratification of killing, such pleasures as this might become every day occurrences, but when the first day of November dawns our little friends which would help to make life pleasant for us will be eagerly hunted and shot on sight! What queer mortals we be, anyhow!

The Recreation Rod and Gun Club, of this place, but recently organized, has been active in getting game wardens stationed at different points, and have had the game laws of the State printed and posted at all the post-offices and conspicuous places in the county offering liberal rewards for any violations of the game and fish laws.

EMERSON CARNEY.

Animals of Pennsylvania and New Jersey.

In a new country like ours, rapidly filling up with restless and energetic people, the face of nature is constantly being disturbed, and changes take place almost without being noticed. Forests are cleared off, swamps dried up, the courses of brooks changed, animals exterminated or driven off, plants once numerous cease to grow, even the climate is changed. To earlier American naturalists it seemed enough to give general statements concerning the distribution of mammals, birds, reptiles and plants, but in these later days, when so much attention is being given to the geographical distribution of the life and the causes which influence that distribution, we need information that is specific. In many cases such information cannot now be had; the time when it was accessible has gone by, the people familiar with conditions as they existed at or soon after the settlement of the country are dead and buried, and no records remain of the facts we desire to learn.

Modern naturalists are now working on the life of old and well settled regions, as well as of deserts and mountains still far from the haunts of man, but often it is most difficult for them to secure the information that they want. As we have said, recorded facts are wanting, and it is necessary to appeal to individuals likely to be informed on the points in question; naturalists, trappers, hunters, aged men living in or near the region to be investigated, and the descendants of old hunters who have passed away. All this entails great labor in the way of travel and correspondence.

A large and singularly interesting volume on this subject has just been published under the title, "The Mammals of Pennsylvania and New Jersey." Mr. Samuel N. Rhoads, its author, here gives us, in more than 250 pages, the results of eleven years' study of the mammals found in the States in question, including in this list not merely the native mammals, but those introduced by man, so that as a matter of fact the work "treats of both living and extinct, recent and fossil, land and sea mammals found in Pennsylvania in the feral state," for there were many cases where horses, sheep, swine and cattle ran wild, and were hunted and slaughtered; in fact, it is said that at certain points in New Jersey wild cattle and sheep have ceased to exist only within the past decade.

In making his list and in drawing the zoogeographic map which accompanies it, Mr. Rhoads has endeavored to conform as nearly as possible to our knowledge of primeval conditions, though no one recognizes better than he how difficult it is to reproduce these conditions, so changed from what they were by the deforestation of the land. "Fire, ax, flood, summer sun and winter frost have made the famous hunting grounds and natural game preserves of the Pennsylvania Alleghenies a wilderness indeed. Where once the Canada lynx, wolverine, fisher, martin, Canada deer mouse, woodland jumping mouse, northern hare, and marsh shrew found a congenial home, the average midsummer temperature may now be roughly said to have risen twenty degrees; drought and flood quickly succeed each other, winds become tempests and winter takes on an Arctic severity. Instead of white pines and hemlocks we have scrub oaks and briars; instead of fern beds, sphagnum and moist shade, we find bare rocks, glaring sun and withered vegetation. The grinning opossum sneaks up the south slope as the last snowshoe hare hops down the northern one, and the lowland cottontail forthwith jumps her ancestral claim. While the rifle and the trap remain their greatest enemies, the beasts of the earth and the fowls of heavens have an even chance. But the era of ax and fire and commercialism has doomed them unless the era of forestry soon rescues them from extinction."

The life zones found in the two States considered by Mr. Rhoads are the Canadian, the Transition, and the Austral. According to laws laid down by Merriam, these zones are limited by temperature; the southern boundary of the Canadian zone being defined by an isotherm showing a normal mean temperature of six hottest consecutive weeks of 64.4 degrees, of the Transition zone a temperature of 71.6 degrees, and of the upper Austral 78.8 degrees.

While the food habits of many of our birds have been quite fully investigated, comparatively little has been published as to the food of our mammals. Mr. Rhoads has given attention to this in his studies, and declares that there is only one species of native mouse in Pennsylvania—the underground meadow mouse (*M. pinetorum*)—whose food habits are so noxious as to make its extermination desirable. Moles, shrews and common meadow mice are greatly misunderstood from an economic point of view, while the rapacious carnivora still found in Pennsylvania and New Jersey have an importance far greater than is generally supposed. Thus the trade arising from muskrat trapping in the Delaware Valley amounts to many thousands of dollars annually, while the muskrat is commonly eaten in portions of New Jersey, bringing from five cents to eight cents each.

Excepting the black bear and the deer, the larger wild animals have long been exterminated from Pennsylvania; yet the Canada lynx is perhaps still to be found by individuals, while beaver has been reintroduced. The last Pennsylvania elk or wapiti was killed in 1867, and the last cougar or panther of which there is definite and satisfactory proof was killed in 1871. The date of the extermination of the wolf is much more uncertain, and Mr. Rhoads tells us that native wolves apparently existed in Pennsylvania as late as 1890.

Of the marine mammals, such as whales, dolphins and porpoises, no less than eighteen species occur on the coast of New Jersey and Pennsylvania, while three species of seals, the common harbor seal, the harp seal, and the hooded seal, have been reported from the New Jersey coast.

Mr. Rhoads gives the typical Virginia deer as well as the northern Virginia deer of Miller as found in the region under consideration, but states that the first has been exterminated from Pennsylvania, but still exists in some numbers in New Jersey. Perhaps one of the earliest deer laws of the Northern States was that enacted for New Jersey, December 21, 1771, providing a fine of 40 shillings to be paid by anyone who "shall kill, destroy, or take any Roe Buck, Fawn, or any sort of Deere" between January 1 and September 1. Through-

out much of the wilder portion of Pennsylvania, however, the northern Virginia deer is common, and this also exists in New Jersey.

Of the great animals of North America formerly covering a transcontinental range, the wapiti or elk is the greatest, and has been exterminated over the greatest extent of territory. It is thus with extreme interest that we read the very full account printed by Mr. Rhoads concerning the former range and distribution of the species in Pennsylvania and New Jersey which shows that up to the beginning of the 19th century elk were common in the entire Pennsylvania Alleghenian mountain system of the Alleghany River, but were rare in the Blue Ridge and Cumberland ranges, while once they were numerous on the Pocono Plateau. It formerly was found in the valleys of the Alleghany, Susquehanna and Delaware rivers, as shown by its remains. He says:

The favorite haunts of the Alleghenian wapiti in Pennsylvania were in the forest-covered mountain elevations where open glades or savannas and old beaver meadows were surrounded by the primeval forest. Where these features were combined in the vicinity of a "lick" or saline spring the greatest numbers of these animals congregated, and it was in such localities that the last representatives of this noble deer vainly sought to escape their final destruction. From accounts received from numerous correspondents, it appears that the "Flag Swamp," situated in the eastern part of Elk county, near the Cameron county line, and forming one of the headwaters of Bennett's Branch of the Susquehanna on the east and of a branch of the Clarion River on the west, was the last refuge of the wapiti in Pennsylvania. A few are recorded as living there in 1850 in a History of Elk County of that date. Between the dates of 1860 and 1867 I have secured records of the capture of two or three which are each claimed to be the last taken in the State. To one of these undoubtedly that distinction belongs, so far as can be discovered. The one recorded by Roosevelt for 1869 is the same as the one stated by Captain Clay to have been killed in 1866 (see records). It is probably the same as the one stated in the Utica Globe article to have been killed by an Indian in 1867, and in the History of Elk County the same date is given for its extinction in that county, reference no doubt being made to the same individual. This "Flag Swamp Elk," taken in November, 1867, in Elk county, by an Indian of the Cattaraugus Reservation, named Jim Jacobs, appears to have been the last of its race in the Allegheny Mountains, unless it shall be proved that some existed later in the mountain wilds of West Virginia. In the northeastern Alleghenies of Sullivan, Luzerne and Wyoming counties they seem to have totally disappeared in the second decade of the nineteenth century, although a few remained in a favorite haunt called "Elk Forest" in the Pocono range of Wayne county until exterminated between 1830 and 1840. In Tioga, Lycoming and Potter counties they haunted the headwaters of Pine Creek and the Black Forest until 1862, when the last was killed. The veteran pioneer, Mr. Austin, saw their tracks as late as 1857 in Potter county, and near the same time a party of hunters captured three alive in Tioga county. In Somerset and Bedford counties, where the mountain glades and saline or sulphur springs were sought out by numerous bands of wapiti and buffalo in early colonial times, their extermination must have been of very early date, as records of them in these localities seem to rest upon place-names and tradition. (See note under Somerset county.) Even more obscure is the evidence of their former occurrence in the southwestern counties of Pennsylvania, and in the parts of New Jersey pertaining to the valley of the upper Delaware. Elk View, Elk Mills and Elk Creek in Chester county, and Elk River in Maryland, are names whose origin I have not satisfactorily traced, but indicate the former presence of this animal nearer the Atlantic seaboard than anywhere else in the United States. From our knowledge of the partiality of the wapiti to mountain districts, it is very unlikely that it ever resided permanently in Chester county. Kalm and one or two historians of the seventeenth and eighteenth centuries record them in southeastern Pennsylvania, and Kalm relates how the "stags" (as distinguished from the common deer) were driven down from the mountains into the vicinity of Philadelphia and killed in great numbers because of a great snow. Such lowland invasions probably account for the place-names we have mentioned as well as for the remains of this animal in camp and village sites of the aborigines on both sides of the Delaware as far south as Trenton. Not only would the rigors of winter drive them from their mountain fastnesses, but the increased persecutions from the starving wolves and of the Indians, and the freezing of the Susquehanna and Delaware rivers, would induce the stricken creatures to scatter over areas hitherto unknown to them. It is likely that at no time during man's existence in New Jersey was the wapiti a voluntary resident of that State, even in the Kittatinny range, which is the natural continuation of their ancient haunts in the Blue Ridge, and in its northern section was in easy reach of a hunted wapiti from the Pocono region seeking to throw its pursuers off the scent in the waters of the Delaware. Only as a straggler, therefore, can the wapiti be considered a member of the historic fauna of New Jersey. It should be borne in mind, however, that the accounts of earliest historians, coupled with our knowledge of the wapiti in the Far West, indicate that this species may have roamed at will in pre-Columbian times over almost the entire region included in this paper.

Regarding the habits and food of the wapiti, it may be stated that they are similar to those of the Virginia deer in most respects. They are, however, more addicted to keeping in companies throughout the year and, like the moose, "yard up" during the season of deep winter snows. The males cast their horns in February and March, and by the month of August they are again renewed in all their perfection. They make a loud whistling snort when alarmed, and during the rutting season the bucks utter a loud note of defiance, which Godman says resembles both the neighing of a stallion and the bellowing of a bull. Caton says it sounds like the whistle of a locomotive. The young females give birth in May or June to one fawn, the

older ones generally two, and rarely three. When wounded, the wapiti is more ready to turn on its pursuers than a deer. In flight they pursue a straight course and will sometimes outstrip the chase of the most enduring hunter and hounds for two or three successive days.

When deprived of their usual winter browse of elk grass and brake by deep snow, they subsist for months on the buds and branches of such trees as they would not touch in summer, and when a crusted snow prevents them from going outside their yards for water they do without it for a long period.

Among the favorite trees which they seek to eat in summer is one called by hunters the elkwood.* This they attack, not only devouring the leaves and twigs, but denuding it of bark. By this means their whereabouts are easily detected, the peeled saplings forming a conspicuous "sign" for the hunter. Basswood is also much sought after, but very few deciduous trees come amiss at any season, the elk being a most omnivorous and hearty feeder.

Audubon, in the book "Quadrupeds of North America," thus speaks of a pair which he had in captivity (Vol. 2, 1851, p. 90): "The pair from which the figures on our plate were taken we purchased at Philadelphia. They had been caught when young in the western part of Pennsylvania. The male was supposed to be four or five years old and the female also was full grown. . . . They often whistled (as the hunters call this remarkable noise) which in calm weather can be heard nearly a mile. This shrill sound appears to be produced by an almost spasmodic effort, during which the animal throws its head upwards and then backwards." Audubon further speaks of their gregarious habits, congregating to the number of 50 to 100 in a herd under one master buck, whose movements are closely followed by the whole band, whether in flight or on the watch; easily domesticated and living to a great age, even 25 or 30 years in captivity; lying down in midday and feeding before sunrise and after sunset. Caton, who had a large number in captivity, and hunted them in the West, gives an account of them in his book on "American Deer," from which the following points may be summarized: The fawn is spotted as in the common deer; in wild, undisturbed country not a nocturnal feeder; more polygamous than any other deer except the red deer of Europe; master deer of the herd nearly always dangerous in captivity, a perfect tyrant during the rutting season, and at all times supremely selfish and abusive; does more courageous than bucks against a wild enemy, giving chase in a body and striking with forefeet, the bucks following at a distance; better adapted to domestication than any other deer; more healthy and hearty feeders, eating fodder a cow or horse will reject; young—feign death, when picked up, lying limp; follow dam in two days after birth, unusually precocious in this respect as compared with other deer; wallowing in summer like the bison; natural gait a trot, very rapid and continued when pursued; when closely pressed into a run soon become exhausted; in their natural freedom inhabiting all kinds of country, contiguous to woodland or forested, whether mountain or plain, ranging from above timberland 10,000 to 12,000 feet to the sea level, but preferring mountainous regions, from which they never stray a great distance unless from hunger or enemies; not as tenacious of life as deer, an ordinary shot soon disabling or killing them; hide of little economic value, being soft and pliable as in other deer similarly tanned, but of little strength and durability; meat much esteemed; horns used by the Indians as bows; canine or fang teeth of males used as a valued ornament or charm.

* Also called the moose tree. It is the *Acer spicatum*, a dwarf species of maple, growing about 15 feet high in the forests.
[TO BE CONCLUDED.]

Passenger Pigeon—Where?

PRINCE'S BAY, N. Y., Oct. 1.—*Editor Forest and Stream:* It is about the time of year that wild pigeons should show up if there are any at all. I am a doubter myself, but last of all I will believe an honest man's word when I cannot deny it. On Sunday morning, September 20, I was talking with a man who had just driven through Staten Island toward the south shore. He was telling me what quantities of birds he had noticed along the route, and he said, "I saw some wild pigeons, something I had not seen for thirty years." I laughed at the idea, and got him worked up to the point where he began to insinuate I did not know what I was talking about. This gentleman is on the three-score mark, and has lived on the island all his life, and he told me that when he was a boy he had often shot them by the dozen in the same spot where he saw the seven pigeons that Sunday morning. As the conversation progressed I found I had no ground to stand on, and I hope they will not be destroyed by Italians or any other pot-hunters. ***

[The question is not of the veracity of those who report wild pigeons, but of their competence as observers. Our correspondent is no doubt familiar with the fact that readers on the Pacific Coast, in the Central West, and all along the Atlantic Coast have very frequently within the last few years reported wild (passenger) pigeons as occurring in some numbers. It may very well be that some wild pigeons have been seen in certain localities, but, on the other hand, we know very well, because we have seen the specimens, that in a number of cases these supposed passenger pigeons were band-tail pigeons, or were mourning doves. On the other hand reported passenger pigeons, only seen flying at a distance, may have been plover, since it is well known that some plover fly very much like pigeons, and at a distance might easily be mistaken for them.]

It is but a few weeks ago that it was reported to us that sixty wild pigeons were feeding on a rye stubble within seventy-five miles of New York. Cross examination of the observers drew from them only a repetition of the statement, with the further declaration that the birds could not have been mourning doves, because they were too large. However, a visit to the rye stubble by a competent observer showed that the birds seen were doves and nothing else. There was no question as to the good faith of those who reported the "pigeons," but they do not know a passenger pigeon when they see it.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Sport on Long Island.

LONG ISLAND is not an exactly ideal spot, looking at it from the sportsman's standpoint, not the happy hunting ground pictured in the Indian's dream, but still the game life of the island is not by any means extinct; and from its close proximity to New York, the island each year furnishes enjoyment to thousands of men who love both gun and rod, but who cannot spare but a few days, or perhaps hours, from their business.

The island is about 125 miles long by twenty in width, the northern side hilly and heavily timbered, while the southern shores are low and indented with numerous bays and creeks. The center of the island is the most unattractive portion of it. Nothing but level plains intersected by occasional roads and covered with yellow grass and scrub oaks, hardly ever more than knee-high, the monotony of the landscape being broken by lonely pine trees, seared by the fierce fires that sweep across these plains every fall and spring, giving the vegetation a sooty, burnt-up appearance which serves to intensify the dreariness of the scene.

The main line of the Long Island Railroad runs across these plains, and the farmer, speedily taking advantage of this method of quick transportation, has reared his homestead and successfully struggled with Mother Earth in his fight for existence, and now the farms stretch in a nearly unbroken line on each side of the railroad, from one end of the island to the other.

Quail, ruffed grouse and woodcock are found on Long Island. In the course of a season's hunting the sportsman may find one or possibly a pair of pheasants that have escaped from the pen of some club or private person.

Although there are more or less quail on both the northern and southern shores, the principal hunting grounds lie in the center of the island in the farming belt. Owing to the absence of thick, heavily timbered woods about these farms, quail shooting, so far as being able to see the bird is concerned, is an easy matter, but while there is nothing to obstruct the vision, there is a tangled mass of briars and short scrub oaks which make walking an arduous task and seriously interfere with your dogs' hunting abilities. For hunting game birds in this section, the setter far excels the short-coated, tender-skinned pointer, who, although willing and probably able to hunt for a day or two, soon becomes so cut up by the cat-briers and burnt scrub oaks with their fire sharpened branches that it is rank cruelty to hunt him, while his long-haired relative enjoys greater immunity from similar causes.

Among the hills of the north side and in the thick swamps and cedar thickets along the southern shore, there still live a few ruffed grouse, more commonly known as partridge. Of late years the grouse has rapidly decreased in numbers. It is found in the greatest numbers in the vicinity of Brookhaven, but a few are scattered over nearly all the island, and there is hardly a local hunter who cannot account for one or two of them when summing up the results of his fall shooting.

While the sportsman is strolling through the fields in the summer or early fall, accompanied by the pup who is to make his debut on the first day of the open season, he may flush an occasional woodcock, but this long-billed wanderer is not found in large enough numbers to warrant hunting him. It is only by lying at dusk near some little pond or water hole in the hills that one may see sufficient birds to enable him to make a decent bag. This is hardly a sportsman-like way of shooting them, however, and is left to the farmer's boy, who, after the chores are finished, takes his single-barrel of ancient make and patiently waits by the edge of the pond, in the shadow of the surrounding vegetation, until he sees the luckless bird, eager to quench its thirst, alight, then remorselessly pots it.

The meadows, which lie all along the southern shores of Long Island, also furnish their fair quota of sport. Yellowlegs, krikeers, golden plover and that little grayish-brown fellow, the English snipe, whose erratic flight has caused many an ounce of number eights to be wasted, frequent these marshy grounds. To the south of the village of Freeport, one of the largest summer resorts of the island, lies a noted snipe meadow, and during the summer months the incessant popping of guns proclaims the presence of many gunners. Rail and meadow hens also live in the long grass along the banks of the meadow creeks, but these birds do not attract as much attention from the sportsman as do the swifter-flying, and consequently more prized, snipe.

The islands near the beach, in the Great South Bay, particularly Oak Island and the Fire Islands, furnish some of the best snipe shooting obtained on the whole south side. Not so easy of access as are the meadows of the main land, the snipe are not disturbed by continuous shooting, and are, therefore, more plentiful and stool much more readily.

If one, however, wishes to kill the larger varieties of snipe, the willet, jack, marlin or black-breasted plover, the narrow strip of sand separating bay and ocean is the spot upon which to set out your stool. Find one of the many shallow ponds that abound on the beach, in which the water, during the last of the ebb tide, is only one or two inches deep, build your blind, stick your decoys up in the water, in the most natural manner, and, especially if all this is accomplished when a blustering sou-wester is blowing, ac-

companied by a little rain, in all probability your gun will not lie idle by your side.

The sand bars lying north of the Shinnecock Life Saving Station, in Shinnecock Bay, form another well-known resort for the snipe shooter. Sedge grass grows on the bars in many places, and in this the sportsman either builds his blind, or if the depth of the water will permit, pulls his sharpie, the tall grass making an excellent cover. Over these bars fly nearly all the varieties of snipe; and famous bags have been made there in past years by men prominent in the highest political and social circles.

The one sport for which Long Island is particularly adapted is duck shooting. From Coney Island to Montauk Point stretches a continuous chain of bays, four in number, all connected by canals, and each one containing excellent feeding grounds for wild fowl. Of these four, the Great South Bay is the largest and Peconic Bay the deepest, but the two on which most of the duck shooting is done are the Shinnecock and Great South bays. On both the same devices are used; when the bay is open the battery, or, as it is locally known, the machine, is anchored on a flat, from one to three hundred stool thrown in the water around it, and the gunner lying comfortably in the coffin-shaped box in the midst of this delusive gathering of decoys deals death and destruction to the unwary wild fowl that comes within shooting distance. The battery is a box built of some light wood, preferably white pine, about six feet long, sixteen inches deep, and if for two men, forty inches wide. This is known as a double battery, the single one being only twenty inches wide. These wings, as they are called, are made, extending from two to three feet on all sides of the box. The purpose of these is to make the box float steadily and prevent water from splashing in upon the occupant. A head fender, made of canvas tacked to narrow strips of wood and generally from fifteen to twenty feet in dimension, is always anchored just to windward of the battery, and enables the gunner to lie in much rougher water than would otherwise be possible, as it keeps the waves from breaking over the machine. This, together with from one to three hundred stool, forms a rig, as the bay gunners call it, and is all carried in the stool boat, generally a large sharpie, which is towed by the sail boat on which the gunner sleeps and lives.

When the bays are covered with ice the scooter takes the place of battery and stool boat, and also carries the sportsman to the air hole in which he does his shooting. This little boat is about sixteen feet long by four in width, and is shaped on top somewhat similar to a turtle, hence the derivation of its name—turtle-back, scooter. These boats all have brass runners on their bottom, and are supplied with an ice hook, lateen sail, oars and sixteen decoys, generally hollow, for lightness is an important feature in the scooter construction. In this boat the sportsman is able either to sail or row over ice and water; and when the ice is so thin that the scooter's runners cut through, the ice hook is used, pulling or pushing, as the case may be, but the craft is always able to go where nothing but a similar boat could follow.

Point shooting is but little indulged in on the island, unless it be on the north side, where the coots that live in the Sound all winter, are sometimes killed when flying past or over one of the numerous points. This style of shooting is principally done by residents of Northport, who stand on the narrow neck of land separating Northport harbor from the Sound, and those of East Marion, who shoot off Rocky Point, just to the west of the life saving station of that name.

Shinnecock Bay sportsmen have a few days of goose shooting each fall and spring. The wary birds are shot from boxes sunk into the sand bars, which make the southern part of the bay unnavigable, unless in a small boat. Generally live decoys are used, and the method of inducing the geese to come to them is rather unique as well as exceedingly interesting to watch. For this sport two, or still better, three men work together. The ones who are to do the shooting are left on a bar near, but not too near—for geese are the wisest bird that flies, and could never be driven to a spot where they have seen men but a short time before—the flock of geese that they have designs upon and proceed to stake out the live decoys, arrange the fox grass about the boxes and in every way endeavor to make the spot look as natural as possible. In the meantime the man in the boat—a small sailing skiff is used for this business—has been sailing off in the direction of the particular flock that has attracted the gunners' attention, trying to get them between him and the bar on which his companions are rigged out. When this is accomplished he sails down on the geese, and they, of course, swim away from him. He then draws off until they have recovered from their alarm, then closes up on them again. This maneuver is repeated time after time until finally the geese, who have been swimming toward the bar, see some of their own kind near and confidently hasten toward what are really the live decoys of the gunner. Though this driving geese, as it is called, may seem to be a comparatively easy operation, not many men are capable of doing it. Patience, perseverance and the ability to correctly estimate distance, as well as to know when to hurry the geese or when to wait until they have entirely recovered from the scare occasioned by the close proximity of the boat, are all required, and many a man has found that driving geese is not the easy task that it seems to be to the onlooker.

The majority of ducks shot are broadbill, but black duck, redhead, canvasback, sprig-tail, brant, old-squaw, coots and whistlers are all killed in greater or less numbers by the gunners of the island. The last named bird is seen only when the bays are frozen over, and then many of them are shot from the scooter.

The four-footed game of Long Island is limited to the smaller varieties of fur-bearing animals, with the one exception of deer. Rabbits, squirrels and fox constitute about all the other species that are hunted, although a few opossum, coons, mink and muskrats are trapped or shot.

The deer shooting is confined to Islip township, the swamp owned by the Southside Sportsman's Club being the home of most of these animals. This swamp

is watched by the gamekeepers of the club, and, owing to the protection thus provided, the deer have increased in the last few years. Indeed, many of the farmers complain each summer of the ruin wrought to their gardens by deer, which have grown so accustomed to the sight of man that only vigorous measures are of use to drive them from the irate owner's vegetables.

The method of shooting these, you could hardly call them wild, deer, on the days provided for in the game laws; to wit, the first two Wednesdays and the first two Fridays after the first Tuesday in November, is not in a strict sense of the term sportsmanlike. If you should happen to live in any one of the different villages adjacent to the shooting grounds—Babylon, Bay Shore, Islip, Bayport, Sayville or Central Islip, you would probably be awakened near midnight by the baying of hounds, rattling of wagons, and the horns and voices of crowds of men and boys who have started at this early hour to reach the selected spot on the fire line, surrounding the Southside Club's preserves, before dawn. These gangs, each comprised of from ten to twenty men, on their arrival at the chosen place, wait until it is light enough to distinguish any object fairly well; and then spread out along the cleared strip, known as the fire line, about seventy feet apart. Then two, or possibly three, of the party, mount their horses, and taking the hounds with them, ride off into the scrub oaks, shouting and making all possible manner of noise in the endeavor to jump a deer. When this is accomplished both dogs and horsemen give chase, the men with the object of claiming the deer if shot by other than one of their own party. The deer always make for the club swamp, and though they may succeed in distancing dogs and huntsmen, some one of the men on the fire line, by this time stationed from one railroad track to the other, a distance of three miles, either kills or wounds the unfortunate animal so severely that its capture is certain. Once in a while an old deer, wise from the experience of many seasons, skulks across the fire line, and these fortunate ones remain on the club grounds until the absence of log and man proclaims peace to the hunted.

Shotguns loaded with buckshot, are used in this kind of shooting, rifles being tabooed, as their range is dangerous to the thousands of men scattered through the woods. This style of sport, while not lacking a certain degree of excitement, is rather suggestive of butchery, and has called forth many expressions of disgust from those who believe in giving the deer a better show for their lives.

In the winter, when the snow covers the ground to a depth of three or four inches, fox hunting is indulged in, and many an exciting run is enjoyed. The Meadow Brook Hunt Club has made Long Island famous for this class of field sport, but not a few of the farmers protest against the methods of this celebrated clique. The foxes run by the club members are not always natives of the island, so the farmer claims, and a goodly proportion of these imported foxes escape, to roam at large, increasing the supply of these devastators of chicken coop and duck pen, and causing an additional trouble and expense to the man who already has had his spring wheat trampled down and fences broken by the hunters.

Rabbits are plentiful in all parts of the island; but squirrels, though shot occasionally on the south side, are more abundantly found in the big timber that covers the hills of the northern portion.

If, in this description of the sports of Long Island, the fishing were not mentioned, all lovers of the rod would have just cause for saying that one of the greatest attractions had been woefully neglected. The trout that inhabit nearly every brook and pond on the island are every whit as gamy as those of the famous lakes of Maine, and though not found in such generous quantities, furnish many an hour's pleasure to persons whose pocket book is not of the plethoric dimensions required for a trip to more distant fishing grounds.

The sport, however, from an angler's standpoint, that yields the most enjoyment and annually draws thousands to this little isle, is bay fishing. Every day in the summer the channel, from Fire Island Inlet to the spot known as the head of the channel, where the shoal water of the Great South Bay commences, is covered with sailing craft, generally hired for the day, but many flying the private ensigns of their owners, and all having on board a merry party energetically striving to fill the fish boxes to the brim. The same conditions prevail on Jamaica and Peconic bays, and many a dollar finds its way into the pocket of the bayman from renting boats and supplying bait.

The gamy bluefish is caught in, perhaps, larger numbers than any of the other inhabitants of bay or ocean, by trolling, or that more killing but rather nauseating method, especially on a hot day, known as chumming. Weakfish, flounders, sea bass, porgies, blackfish, Spanish mackerel and other species are found.

Brief mention has been made of the Southside Sportsman's Club, which, though not the only club of its kind on the island, is one of the oldest and largest. It is near Oakdale. Founded in 1866, it has grown into a large organization representing many millions of dollars; and it owns or controls thousands of acres through which flow numerous brooks, and both land and water are abundantly stocked with game and fish.

The Wyandanch Club is a similar institution, with considerable land in the vicinity of Smithtown. Some of the finest quail shooting on the island is enjoyed on the preserves of this club, which turns out hundreds of quail each year, and not only rigorously protects them, but takes excellent care that they shall not want for food during the severe winters.

The Westminster Kennel Club is at Babylon. These are three of the most prominent sportsman's clubs on Long Island, but there are numerous others as well as many private preserves, among which may be mentioned those of W. K. Vanderbilt and W. Bayard Cutting.

Life in the Rockies.—IV.

(Concluded from page 258.)

For a few days in the timber camp I had been slightly indisposed, during which time we had run out of meat, and I did not feel equal to going out to hunt. One morning I took a glance around, as I invariably did when coming out of the cabin, and saw a deer standing about 100 yards away, taking a look at our camp. I went inside, got my rifle, and stepping to the door I fired at it, when it humped its back, went a few steps and lay down. We had in camp a large shepherd dog, old Jack, the best hunting dog for big game I have ever seen. I had not then an opportunity to see him after big game, but had heard his master, Mr. P., talk of his worth, and thought this was a good time to try him. The dog was 200 yards above the cabin with Mr. P., who was making fence-bucks. I went up and told him the situation, and he came down with the dog to help. We started over, and when we were half way to it, it got up and old Jack saw it, but as usual would not go a step toward it until told to go. I told him to go after it, and he went with a will. It was in a bad windfall, and the way that deer cleared that down timber and left the old dog behind was a revelation to us, who expected Jack to come up with the deer immediately. I followed a short distance, but could not go far. I sat down and in a very short time Mr. P. gave a whoop, which I knew meant something, and I made my way about a mile down the gulch which we were near, and there found that Jack had caught and killed the deer in short order, and we prepared it for transportation to camp. Previous to that I never would allow him to go with me hunting, but after I saw how much sense he had, and also how speedily and surely he could run down and capture a wounded deer, I generally took him with me on all my hunts.

It was seldom that I needed to take time during my regular working hours to go hunting, but generally managed to kill enough to keep us in meat by going out late in the evening after the day's work was done. One evening, just as the sun was sinking behind the great towering mountains in the west, old Jack and I started out to look for meat. We went straight up the side of a timbered mountain, then followed one of the numerous deer paths around the side of the mountain toward some little open, grassy spots. It was a perfectly still, quiet evening, without a sound of any kind of life, and the only thing to be heard as I slipped noiselessly along with moccasined feet, was the panting of old Jack, who was fat and covered with long, woolly hair. As long as I would keep walking he would keep up his panting, but the instant I would stop he would cease, and not a sound would escape from him as long as I stood still. While I would be listening he would look up at me, then turn his head to one side and listen so intently and eagerly that no one, seeing his great, intelligent eyes, and noting his actions could doubt that he knew as well as I what I was looking for. Just as it was getting dusk I stopped near a thick, brushy place, and heard the muffled thud! thud! of deer, which had probably winded us and were taking a hasty leave. Jack heard them also, and knew well what it meant, but never budged. Some fifty yards ahead was a little rocky knoll, beyond which was a steep slope of open ground, at the bottom of which there was a windfall, and I judged rightly that they would go through this. I therefore made a lively run for this opening, and when I got there saw the deer—two of them—just entering the windfall, 100 yards away. They stopped to look back after entering the windfall a few rods, and I immediately got in my work and brought down the largest of the two, but fearing it might not stay down, as is frequently the case when they drop in their tracks at the crack of the gun, I told Jack to go, and he went like a whirlwind, but he missed the one that was down and got after the other one, and did not get back until after I got to the one that was down, which was dead when I reached it. I was then about a mile from camp, and thought I could call to Mr. P. to assist me in getting the meat to camp, so I sent out some wild whoops, and succeeded in making him hear me, and he started out to hunt me, but not getting the direction exactly, he failed to locate me, and went back to camp and to bed.

I had never tried packing a fresh killed carcass of a full-grown deer alone, but concluded to try it. Shouldering the warm, slippery thing I took my rifle in one hand and started for camp, and about an hour after dark staggered into camp, as hot and tired as any American who ever shouldered venison. One afternoon we had a hard rain, and about three o'clock, after the rain was over, Mr. P. said, "Guess you had better take the rest of the day looking for meat." I took my rifle and started up through the woods and in twenty-five minutes was back to camp for a horse to pack in a deer which I had killed.

It was seldom that I went out for meat and came back empty, but one day I went out right after dinner and spent all of the afternoon without seeing any big game. While sitting along a game trail, watching, I heard a rustling noise, and soon an old mother grouse with about a dozen young ones following her, came in sight only a few steps away, and it was with much interest that I watched them as long as they were in sight. They were tiny little fellows, and it was most interesting to see how suddenly they would dart off and seem to vanish out of existence at the least warning sound from the old hen. I have since thought that if some of the debaters who have been recently advocating the theory in FOREST AND STREAM that the young have to be taught by example what to do rather than by knowing it by instinct, could have watched that family for half an hour or more as I did, they would weaken in their belief, for could these little youngsters, but a few hours old, have been taught what they knew by seeing other grouse run and hide at the same sound? No, they knew it by instinct, before they were two hours old. To those not familiar with birds of the grouse family, it is surprising how shifty the young ones are. I knew of the nest of a quail being passed in the morning when the eggs were all there, none of them being broken open, and in the evening of the same day the eggs were all hatched and the young gone.

The next day at 4 P. M., as I was chopping about one and one-half miles from camp, I took my rifle along, and

took a circle on my way to camp. When passing the point where I had killed my first elk, it was getting so dusk that objects were very dim, and I jumped a yearling bull elk, which ran toward camp, into the heavy green timber. Not having a good opportunity for a shot, and being much opposed to shooting at game by random, I withheld my fire and went on into the green timber toward camp. After going some distance into the woods I saw the elk off to my left about fifty yards, running parallel with the way I was going. It being so dark in the woods, and the timber so thick, I did not risk a shot, but saw at once where I could maneuver to its undoing. About 200 yards straight ahead of me was the head of a ravine, around which was a favorite pass for all kinds of game, and I was quite certain it was making for that pass. I got down to a 200 yard sprint in a way that could only be induced by the vision of 250 pounds of good, tender elk meat. It was so dark, and I was so busy watching for a clear track through the underbrush that I was within a few yards of the head of the ravine before I realized it. Just as I put on the brakes to stop, I saw his majesty coming straight toward me; he had gone rather beyond the place, in his hurry, and was coming toward me to get around the head of the ravine, rather than going down through it as I had planned he would. I dropped on one knee, which was always my favorite attitude for good shooting, and when he was within about 25 yards of me I whistled and he stopped. It was so dark I could only level the rifle at him, without seeing the sights; when the rifle cracked he whirled around and ran back a few rods and lay down by a tree, with his head directly behind the tree, so that I had no difficulty in crawling up within a few steps of him, and I broke his neck with the next shot. Mr. P. had been in bed when he heard me shoot, and when I came in he suggested that I had better just do my hunting at night thereafter and save time.

Work in the wild woods, which have never been touched with an ax, and where the wild creatures live in their natural state, is full of interest, and I have at times become so engrossed in the study of wild life about me as to almost forget what I was working at. To note with what engineering skill their trails are laid out through the mountains, so as to take advantage of every ravine, canyon, ridge and peak, so as to get from one point to another through rough, wooded country by the easiest possible routes, would cause anyone to admire and wonder at their seeming wisdom. I never crossed one of these well-beaten and long used trails along the steep mountain slopes without thinking, "What could an observer have seen could he have been stationed by the side of this trail all through the past ages, and seen all the wild creatures which contributed their share toward the making of this trail?"

Once, while removing an old log which was so decayed as to be readily torn to pieces by the hands, I found, directly under the log, and consequently several inches under the ground and old leaf mould, a pair of buck deer antlers, with the skull attached to them, which had evidently been protected from the rodents all these years by being covered up. I spent considerable time holding an inquest over the remains, to try to determine how and when it met its death; and whether it was lying there and was killed by the tree falling upon its head, or whether it had met its death before the tree fell. It was all so fascinating to try to picture in the mind the tragedy that must have happened there in the solitary wilderness long before the foot of any white man was set in those mountains; for, judging from the great length of time which the fallen pine timber on those dry mountain sides will remain solid, the log must have lain there more than a hundred years.

While working on the same spot at another time, I stopped, straightened up and looked around to see if any living thing was in sight, as was my habit. Up on the mountain side in the open timber, less than 100 yards away, stood an immense buck deer with wide spreading antlers, watching me at my work. I began to talk to him in a loud voice, and apologized for intruding on his territory, and told him with some genuine sadness that he and his kindred were doomed to be crowded out, like the Indian, whose tepee poles were scattered around only a few rods from that spot. He stood and listened to it all, then walked slowly away, as if in a deep study.

The next camp meat was that of a full-grown elk which I found late one evening about one and a half miles from camp, as I was on my way from my work.

I frequently got on my horse and rode over to Big Creek Park, to see my neighbors, and look after my ranch. One evening while on my way back to camp, and while going through a little open park, I looked off to my left, and there was a fine buck deer with large antlers standing in the edge of a windfall, about seventy-five yards away, watching me as I rode by. I had no gun, but remembered hearing of people who had roped deer and other game from their horses. As I was riding a horse that was swift for a short distance, my plans were made in an instant. After getting somewhat past the buck, so as to keep him unsuspecting, I began circling gradually around toward the windfall, to get as near as possible to him, hoping when he would start I could get him to go out into and across the park, which was about 200 yards wide, and believing that in such case I could make a dash and come up with him. All this time I was taking my rope from the saddle, and had it all ready to throw, and was just getting ready for the chase when he wheeled around and went off through the windfall, after I had gotten quite close to him, and spoiled my plans.

One day I was at Luke Wheelers' and they had been out of meat for some time. It was getting late in the season, and the deer were gathering in bands preparatory to leaving for their winter quarters, and were hard to find. As the country between there and the timber camp was all unsettled and full of game, Luke suggested that I take his rifle with me as I went back to camp and try to kill a deer for him, which he might get the next day, as he intended driving to our camp with the wagon and take his wife and sister over for a day's outing. While I was allowing my horse to climb slowly up the side of a steep mountain on the other side of which was our camp, just as the sun was setting, I saw a deer standing away above me feeding. I had a lariat rope tied around my horse's neck, and fastened in a coil to the

saddle, so that it could be taken loose in an instant. I loosed the rope from the saddle, jumped off my horse, and dropped the rope at my feet, dropping on one knee on top of it to keep the horse from leaving me, and took a shot at the deer. The horse made a plunge to get away and my feet in some way got caught in the coils of the rope, and, for an instant there was a general mix-up. By some of the most creditable high-kicking and contortions ever executed, I was disentangled from the rope, and as soon as the horse found it was free it stopped and began grazing.

I gathered up the gun and my scattered senses and slipped up a little ravine a few yards, where I could get a better view of where I had seen the deer, and raising up I saw not only the one I had seen, but about eighteen or twenty others, all standing within gun-shot.

It was the largest bunch of deer I ever saw together, and it was a splendid sight. They were in their short gray coat, and looked so much the color of their surroundings, in the dusk of the evening, that it was difficult to see them only as they would move a big ear or turn their head.

Taking careful aim at a large doe, which was nearest to me and standing broadside to me, I shot, not doubting that it would collapse right there. It never moved when the gun cracked. Pumping in another load I shot with even more care, if possible, than before, and it still remained motionless. Then it just occurred to me that I was shooting a strange gun, and I knew it was sighted entirely different from mine, but how I did not know. Some of the deer were by that time getting uneasy and beginning to walk cautiously away toward the timber a few rods distant. I was uneasy also, but remained where I was. I concluded that the gun was shooting high, and aimed for the fore leg, half way between the knee and the body, and when the gun cracked that time the deer dropped, but I knew full well that it was not down to stay. I jumped up and ran with all possible speed toward it, and did this so suddenly that I was fairly among the others before they were aware of it, and such a stampede as was on for an instant would have made a picture for an artist, could it have been continued. I was within ten steps of my doe when she saw me, and seeming to rally all at once did what I had expected—jumped up and started off on a good run. I was as close as I wanted, and at the second jump put in a shot that brought it down to stay. The first shot had simply creased it on top of the shoulders, as I supposed. By the time I had the game dressed and got my horse it was dark, and I left it there and rode on to camp by starlight.

If in all the affairs of life I could profit as well by the mistakes made, to guard against a recurrence of the same, as in the art of hunting, it might be well. I owed my success of that evening to a failure on a previous occasion, when I was stopping at Wheelers' for a few days. Deer were very hard to get just then, and I volunteered to try and get one for them. I had hunted hard and faithfully until about two o'clock, when, in coming over a bare ridge, I saw a fine bunch of deer, but they saw me at the same time, and were off. There was some snow, and I followed after, but soon found that they were sighting me at intervals and moving on. At last, by great care and some maneuvering, I saw one of them standing on a bare hill nearly a mile away. Having them once located and stationary, I knew it was only a matter of time until I should get to them, unseen, for stalking was my strong hold. By much circling I kept in ravines and sheltering places, and crawling on my hands and knees the last hundred yards I finally got to the nearest point to them that it was possible to get, which was still a long shot. There were quite a bunch of them standing and lying around, at a point where they could see far back on their trail, and were evidently feeling secure in their advantageous position. The one which was nearest to me was lying down, and taking a very careful aim I fired at its shoulder. When the gun cracked it began to flounder and kick around, but could not get up. In my inexperience at that time I supposed of course that if it was disabled for the time being it was so for good, and after taking a few long running shots at some of the others, I began hunting around for the empty shells which I had thrown out of my gun, and after a minute or more of search for them, I started leisurely over to take care of my deer. When about half way to it I saw, away down to my left, a deer running away, and it fell, but got up quickly and went on at a good rate. I realized as soon as I saw it fall that it was the one I had been so sure was mine. I fired a couple of parting shots at it, but it went on, and although I followed it for miles, I never again got sight of it, and never even found where it had stopped. Subsequent experience taught me that it had been creased on top of the shoulders or neck, and I have never followed any game thus wounded and come up with it, though I have followed some animals many miles. Such wounding is probably not fatal, and they soon recover from the effects. When I looked back through my "hind sight" and saw how easily I could have gotten it before it got up at all, and then realized how badly I wanted it, my remorse was a just and full punishment for my mistake. A day or two later, when telling the famous hunter, Cooke Rhea, of my blunder, he said: "Take this advice, which I can give from a long experience: when you shoot at anything and it drops at the crack of the gun, get to it just as quick as you can!" With the above experience and advice I never lost another head of game in that way, but have frequently had success which depended on getting on the spot with all speed. On the other hand, when a big-game animal is shot and runs a few rods before falling, then it is safe to take plenty of time in getting to it, for it will stay down.

The time was drawing near when our work would be finished, and camp would be broken. I was anxious to get some meat to take home with me to my ranch. My saddle horse and a mule belonging to another fellow had left the range where they usually stayed, and Andrew Pennoyer and I started out one morning to hunt for them, and I took my rifle, hoping to see something to shoot. The mountain on which we were camped was mostly covered with timber on the north side where we were camped, and on the south side it was open, and covered with fine feed for stock; it was there we believed our stock had gone, and we went over and found them

away down at the foot of the mountain, fat and well contented. We caught them and were leading them up the side of the mountain when a deer ran out of a small patch of timber and went out of sight over a ridge. Leaving Andrew in charge of our stock, I took a sneak up to the top of the ridge to look for the deer. I could see nothing of it, but while looking carefully over the vast open mountain side of ridges and ravines, I saw, away near the top of the mountain, several animals moving about, but as they were fully half a mile away I could not be sure what they were; anyhow it was game, and I knew it was deer, antelope or sheep, and I instructed Andrew to keep well into the ravines and make his way with our saddle animals to the top of the mountain and there wait for me. I went straight up the mountain over the top, then keeping just over the top, followed up to a point opposite where I had seen the game, then crawled down until I could look over, where I saw a small bunch of antelope just where I had first seen them. They were all lying down, and I began one of the most difficult stalks ever I tackled. It was all open except for a few scattering sage-brush and an occasional rock, with a fallen tree as the objective point to be reached, which would bring me within good range. The most of the distance had to be covered by crawling flat on my belly, which is a slow and by no means easy mode of locomotion, but serves a good purpose when no other will bring the required results. I did not raise my head to investigate from start to finish, and when I finally slid up to my position and peeped under the log, they were all standing up looking intently in my direction, having probably seen some northeast corner of my anatomy as it may have risen above the prescribed line of vision, while of course my head was crowding the earth.

I poked my rifle over the log and shot at the nearest one to me, which started on the run with the rest of the bunch, but fell dead after running a few rods. The others ran within a few rods of Andrew, who was on top of the mountain nearly a mile away.

Some years later while spending some months with my friend, James H. Cook, a famous hunter and ex-chief of scouts during the Indian wars in the West, on his ranch in Nebraska, he told me a story of his own experience which brought to mind this particular stalking of antelope. He was guiding a party of four Englishmen on an elk hunt; they were without any hunting experience whatever, and were very raw. He sighted some elk, but had a difficult stalk to get near enough for sure shooting. The only way to come up with them was to go on hands and knees, and keep very low at that. He started to lead the way, and told his Englishmen to do just as he did. When he had crawled some distance, squatted as close to the ground as was possible, he stopped and looked back to see how England was coming on. He said: "They were coming, all four of them, strung out in single file, and crawling, not on their hands and knees, but on their hands and feet, with their heads so low that their ears were trailing on the ground, and their rumps as high in the air as they could possibly get them, looking as if they were trying to stand on their heads, and the sight was so ridiculous and comic that to suppress an outburst of laughter was the severest strain of the day." Of course he accompanied the description by getting down and showing how they were coming, and afforded food for such laughter as adds years to a lifetime.

A few evenings later I went for a final hunt with old Jack, and on the old familiar grounds, as I intended leaving the next day. After following the top of the mountain a distance of nearly two miles from camp, I started to go down the side, when I saw about a dozen deer away below me, scattered in and around a quaking asp thicket, and they saw me. They were so far away that they did not take alarm, but I knew it was useless to try to get closer, as there was no way of doing so only to walk down the bare open side of the mountain in plain sight; so I decided the only thing to do was to try a long shot. I sat down on the ground and took a shot at the one nearest to me, and none of them seemed in the least alarmed, and I kept shooting away at different ones until I had fired about a half dozen shots, and still they kept browsing around without any concern, and I gave it up as a bad job, as they were beyond my range. I went on down then toward them, and they soon disappeared in the thicket. I went on through the thicket and came into more open woods by the side of a small ravine, and saw the glimpse of a deer as it went up out of the ravine into the woods above. It did not belong to the bunch I had seen, and had not seen me, so I crawled carefully down into the ravine and followed it up a short distance, then came up so I could see up into the woods. There I saw my deer, a splendid buck, standing broadside to me, about fifty yards away, and, fortunately for me, his head was entirely hid by a bunch of leaves, while the whole body was exposed, thus allowing me to see him while he could not see me.

I laid my rifle across a rock right in front of me and shot him through the shoulders, when he fell, but seemed to be trying to get up. Old Jack had been sitting close behind me all this time, and he looked so eager for a share in the fun that I couldn't deprive him, and said "Go get him!" He had him by the throat before I got half a dozen steps toward him, and how he did enjoy the tussle. It was one of the fattest deer I ever killed, and was a valuable addition to my larder for the coming winter. There I learned something new again. It had always been my belief, as it is of many others, that deer always add additional numbers of points to their antlers for each year of their age, and I always believed that a two-point buck (two points on each side) was always two years old. I have killed quite a number of bucks which had the small two points, where the size and appearance of the deer would indicate that they were two years old, but this one, though having but the two points on each side, had much larger horns with wider spread, and the size and appearance of the deer indicated an older animal. Being certain it was more than two years old, I was puzzled, and called a Mexican, who was working in our camp, and who was an experienced hunter, to explain what I believed to be an uncommon freak. He opened his mouth, and as soon as he saw its teeth he told me, by signs, that it was four years old, and that the points on the horns had nothing to do with determining the age.

So far as I have been able to observe, all two-year-old bucks have the two points on each side, but all two-point bucks are not two-year-olds. Like the old adage on lawyers, "All lawyers are liars, but all liars are not lawyers."

MORGANTOWN, W. Va.

EMERSON CARNEY.

A True Bear Story.

SOUTH CHATHAM, N. H.—I had shot at two bears before the one about which I am going to tell you.

The first one I saw last year, and Dr. E. A. Chase, of Brockton, Mass., who was spending the summer at my place, was with me. We were out fishing, and the bear came quite close to us. Having brought my shotgun along, I fired at him, but as my gun was loaded with fine shot, it could not have injured him much.

The other bear I saw up in the woods, where I was hunting small game. At sight of the bear I drew my charges of fine shot and put buck shot in their places. By that time the bear was nearly out of sight. I fired at him, but it did not take effect, and he got away. But now to return and begin my story. One September afternoon I went up in the woods to hunt small game. I had been away from home only a little while, and had just entered a beautiful grove of oak trees when, about a hundred yards away, I saw a large black bear.

He was down on his haunches eating acorns. The next instant, however, he had raised himself on his hind legs, as tall as a man. I decided that it would be impossible to kill him with my shotgun at so long a distance, and I had almost made up my mind to go home for my rifle, when bruin started away, and making a circle to the left, disappeared from view. Fearing that I should be unable to find him again if I went home for the rifle, I decided that I would do the best I could with the shotgun, which was loaded with buck-shot.

So crossing a ravine to my left, I crawled up the hill on my hands and knees to head the bear off. In a moment I caught sight of him standing on a large, flat rock about eighty yards away. The distance was so great I thought it best not to fire. The bear stood watching some cattle that were a short distance away, for a few moments, and then started off again. I followed until I lost sight of him. In a few moments, however, I saw him again, this time coming toward me. I dropped behind a large boulder close by, and waited. He kept on coming, and when he was within thirty yards of my hiding place, his side being turned toward me, I fired. I only wounded him, however, and he started off again. I followed a little way, and fired a second time. I hit him back of the fore shoulder. He started to walk away, nevertheless, but he had only gone a short distance when he fell, and in a few moments he was dead.

I then got a team and some men to help me, and we got the bear home. He measured six feet and three inches long, weighed 160 pounds, and was one of the largest bears ever shot in this vicinity, which is in the edge of the White Mountains, near North Conway.

A. B. F. STILES.

The Maine Season.

BANGOR, Maine, Oct. 3.—*Editor Forest and Stream:* The game season is on in Maine, but the usual rush of sportsmen that usually marks the beginning of the season is conspicuous by its contrast with preceding years. Those who advocate the license idea and believe that it was a good thing for the State at large, now say that the great majority of non-resident sportsmen, having to pay fifteen dollars for their privilege, are waiting until their outing will permit them to kill both moose and deer, and so will not visit this State until later. The camp and hotel owners, transportation companies, and others interested are sincerely hoping that this may be so, and look forward to the middle of next week to see the promised influx of sportsmen from other States. One dreamy representative of the game interests is reported as saying to a reporter that the way sportsmen were pouring into the camps is beating all records—and so it may be, but just the opposite of what he may have meant to be understood as saying. One year ago the night Pullman from Boston to this city brought twenty sportsmen, and the same night this season it brought six. That night a year ago there were as many more who sought sleeper tickets that could not secure berths; this year those six were practically all the hunters aboard the train. "In ten years," said one of the party, "I never saw the Boston station so lacking in evidences of outgoing sportsmen as it was last night." Still, the crowd may come later, and there are many who are trusting sincerely that it may be so. Those guides whose old established parties have cancelled their dates don't hope for anything but a chance to kill a couple of deer and a moose and sell them to the markets, thus earning a few dollars at least in the spare time they expect to have this fall.

This, by the way, is a great year for bears. A prominent taxidermist of this city told the writer to-day that he had received upward of twenty bears in the last three weeks, which beats all records in Bangor. Some of these have come from New Brunswick and some from Bangor, but they have all been bears, and the sportsman who wants to hunt b'ar needs no license, this year or next, in Maine.

But if there are few sportsmen coming into Maine just now, her neighbor "across the line" is having an abundance of business in the way of moose hunters, while some are coming out from Newfoundland with their gracefully horned caribou. A large number of these Canadian-killed heads find their way to this city for mounting, and the first to be received here this season was killed by Dr. J. C. Wilson, of Philadelphia, who hunted in the country reached via Bathurst, N. B. The largest head from that country measured 60 inches, and was sighted by C. Carnegie, of New York city. The antlers spread 60 inches. A. B. and T. W. Roberts, of Bala, Pa., and Joseph G. Rosengarten, Jr., and A. L. Wheeler, of Philadelphia, Pa., have been on to the Newfoundland barrens, sending out three fine caribou heads

apiece. Amos P. Webber, M.D., of Boston, has one of the handsomest heads seen here in a long time, the antlers being very massive and spreading 58 inches. Other trophies received from the Provinces include one moose and bear, H. G. Rowe, Medina, O.; a moose, Thos. G. Rowe, Bucyrus, O.; a bear, C. E. Warren, Cleveland, O.; one moose, Dr. Benj. Pennabaker, Philadelphia, Pa.; two moose, R. H. Stevenson, Boston; one caribou, H. Cummings, Jr., Boston; one very nice moose, B. L. Longenecker, Brooklyn, N. Y.; a caribou (from Quebec), E. L. Pollock, Bridgeport, Conn.; moose (head spread 58 inches), George F. Norton, New York city; an entire family of five bears, Joseph Adamowski, the widely-known Boston musician. Perhaps the most astonishing story of the game season in New Brunswick this season is that of the experience of George Wilcox, of Meriden, Conn., who was accompanied by his little son, eleven years old, in a trip to Newcastle. The boy shot his moose with a .22 caliber rifle. Judge H. J. Cookinham, of Utica, N. Y., had a fine trip into Newfoundland, and sent two caribou heads here to be set up. Benson Mann and son, of Philadelphia, secured four in the same barrens, and Rev. Harold Pattison, of Hartford, who left his summer camp at Moosehead Lake a month ago or less to try the same sport, succeeded in shooting three caribou. Charles W. Keyes, of East Pepperell, and Henry W. Keyes, of North Haverhill, Mass., secured three caribou apiece, and E. Otz, of New York city, made a double trip, getting three caribou in Newfoundland and then coming over to New Brunswick, where he secured two moose.

HERBERT W. ROWE.

Massachusetts Fish and Game.

BOSTON, Oct. 3.—*Editor Forest and Stream:* The readers of Boston dailies last Thursday were given a genuine surprise by the report of a buck perambulating the streets of Chelsea, a city comprised in greater Boston, and within the limits of Suffolk county. The deer, by good fortune, turned into a street where is a stable, and, by intuition, I suppose, considered that the proper place of abode. At any rate he took possession and was secured. The owner was nonplussed and not knowing just what to do, telephoned in various directions for information, the result of which was the advent of Deputy Warden Bent, who was sent by Capt. Collins to take possession of the deer, as the property of the State. The deputy secured needed assistance and succeeded in transporting the deer to a remote forest several miles from the city limits, where he was set free, and it is quite probable that he will have full enjoyment of his liberty till the expiration of the close time five years hence.

It is also reported that the people of Gloucester are greatly exasperated by the killing of a deer in the outskirts of that city. The Commissioners have been informed that several owners of dogs have allowed them, or encouraged them, to chase deer, and have sent warnings to those persons, and have instructed their deputies to see that the law is enforced to the letter. Your readers may rest assured if the deer are not saved it will not be the fault of the State Commissioners and their deputies.

Deputy Bent had a case against a Boston dealer for shipping short lobsters which came before the court on Wednesday last. I am informed that the dealer admitted to Mr. Bent that he shipped them, and the deputy asked the judge whether his own statement would be sufficient, and was told that his testimony would be of no account—that he had no standing with the court. At first the judge objected to having witnesses come from Fall River, where the lobsters were delivered, on the ground that it would involve too much expense. However, several witnesses were brought from that city and gave their testimony, and it would seem the case against the dealer was clearly proven, but for all that he was acquitted. The source of my information is such as to preclude the possibility of doubt as to the facts above stated, and the case should, it seems to me, be carried to a higher court. As President Reed, of the State Association, said at the conference of commissioners, the 10½-inch law is a very difficult one to enforce, and when a case is brought before a judge who is prejudiced against the law, a conviction is impossible.

It is too early yet to learn how our hunters find the partridges, but that the quail shooting will be good is certain, the reports from various parts of the State indicating that they are abundant, many having been seen in sections where they are not usually found at all.

Commissioner Wentworth writes that the gunners who have sought the covers in New Hampshire have not as yet secured large bags, but he anticipates better results later.

A party of Boston sportsmen are arranging to visit Sandwich, N. H., in a few days for deer hunting, and it is quite certain that a considerable number who have been accustomed to hunt big game in Maine will go to the northern section of the Granite State this year instead. For the man who can spare but two or three weeks from business, this furnishes an inviting field, not only on account of accessibility, but for the abundance of game as well. The great host of hunters who can only go out for a day or half a day will welcome the time when they can get now and then a deer near home.

Our Commissioners tell me they have of late been called on to appoint three of four unpaid deputies every week, and now almost every town wants one or more fish and game wardens. This is unmistakable proof of the increasing interest on the part of the community. Capt. Collins has not only kept his deputies on the move, but says he has made a careful examination of about thirty ponds, and has notified a number of sawmill owners to keep sawdust out of the streams.

Your correspondent received a pleasant call recently from the well-known Springfield sportsman, Mr. Charles Clark Munn, author of "Uncle Terry" and other interesting stories. His latest book, "The Hermit, A Story of the Wilderness," which I have just read with much pleasure, appeals especially to those who enjoy woods life. Mr. Munn was one of the leaders in the convention of clubs in November, 1899, which resulted in the formation of the Central Committee and the consequent improvement in the bird laws of our State.

Dr. Bishop's party returned this week from New Brunswick with two bull moose and a caribou, killed in

the Canaan River country. It is reported that fifty deer have been shipped through Bangor. The proprietors of camps reached from Bingham are expecting a poor season, although they have a very good moose country. Mr. Davis, of the Lakeside, reports deer and bear abundant, as well as grouse. This is a good point from which to hunt in New Hampshire. CENTRAL.

State Game Preserves.

NELWOOD, Ill., Oct. 5.—*Editor Forest and Stream:* I have noted the several communications in FOREST AND STREAM regarding the preserve question, and wonder if any of the anti-preserve writers own their own homes; and how, if they have a pool on their farm or in their dooryard, or a deer or two in their pasture, or a nice bunch of quail in their stubble, they would like it if some person came along and caught the fish or killed the game, and they had no right, under the law, to say them nay.

I do not own a farm, neither a game preserve; but I do think that if I did I would wish to say who should have the permission to hunt or fish thereon.

This country threw off the English yoke because that Government failed to protect a man in his property rights, and imposed on him in other ways.

Our forefathers declared a man's house was his castle, and in it he was supreme, so long as he kept within the law; and so it stands to-day, and I predict that when this right is taken away then there will be trouble.

I hold the rich man's property to be as sacred to him as the poor man's home is to him, and that he has just so much right to forbid trespass as the poor man has. These are rights that may not be taken from any man, nor should they.

The question has now simmered down to, What is the remedy?

In some of the States the question is easily solved, while in others it is a difficult one indeed. In well settled old States, where the land is all owned by individuals or corporations, it would be a hard nut to crack. On the other hand, in States like Michigan, Minnesota, Maine and all the Western and Northwestern States, it should be quite easy.

Take for example Minnesota, where they are making a national park out of some of the most valuable pine lands of the country; and where the pine has been cut off thousands of acres of land that will not be used for any purpose whatever for another generation.

The cut off and burned land lies in tracts of thousands of acres, which have reverted to the State to sell for taxes. Why not make a State preserve out of some of this worthless land? It can be done; and the game laws will protect the game that thrives in that portion of the State. Let no hunting be done except during the hunting season, and a moderate license be paid for the right to take a limited number of deer or moose; and let any one hunt who pays the license. I know of enough such land, in St. Louis, Lake and Cook counties, to make a State park that would keep stocked in spite of all the hunters that would go there; for from actual observations I have learned that not over one-third of the hunters who go out during the season get the lawful allowance of game.

These lands will no doubt be bought up in time, for no other purpose than for game preserves; and if they are, individual ownership will bar any one from hunting or fishing on them. On these lands are beautiful lakes and streams, all of which abound with several varieties of fish; and the deer by thousands and moose in plenty live and thrive all through that section.

Why not agitate this question with the several States, if for nothing more than the preservation of big game? J. P. B.

A New Wrinkle in 'Possum Hunting

A MAN who was raised in the country in Virginia and says that he has never been "possum huntin'" has not only missed the best of sports, but the average man would either vote him a "Miss Nancy" or a lazy, good-for-nothing fellow. I will admit that the negro, with his characteristic sayings, adds largely to the fun of the thing, and the "new issue free nigger" who has been to school is not capable of getting off the funny sayings that we used to hear, but still, a successful 'possum hunt cannot be had without having one or more negroes along. I have just come through one of the most successful, as well as amusing, in all my experience.

At this season of the year the foliage is very thick, and it is difficult to look up into the tops of the trees.

I took with me last night a small quantity of red fire, such as is used in tableaux scenes, and set fire to it with a match. Instantly it shone through the thickest boughs, and not only enabled us to locate the game, but had it not been for the fire we might have lost it altogether, for it often happens that the possum goes up one tree and crosses over to another. Then it is impossible to get him, and oftentimes the negroes say "dat dorg done tole a lie," when in fact he has barked up the right tree.

Twice last night the red fire revealed his whereabouts by showing every portion of all the trees for a hundred feet around. I want to tell of this for the benefit of brother 'possum hunters.

A New York city man, and a gentleman from Buffalo, N. Y., accompanied us, and as they had often read about such things in the South, they had the very best opportunity of seeing it in all of its phases.

We rarely ever cut down trees, as the young negro men can climb almost any sort, and either grab the game by the nape of the neck or shake him out, after shoving him into the topmost boughs.

Last night a young negro climbed up within a few feet of the 'possum and commenced to shake. Failing to dislodge him, and as the varmint had his head turned toward him, he was afraid to take him by the neck, and he cried, "I'll jes' spring off an' ben' de tree down, an' you'll can take him off." "All right," said I, "come ahead." And I prepared to catch him; but, although the tree was not a large one, it was a tough one, and the negro couldn't "ben' it down" as he thought, and it lacked about twenty-five feet of reaching the ground.

There he was suspended in midair and struggling with all his might to get his toes back to the tree. Seeing that he had to drop, he asked us to look to see if there were any stumps for him to fall on. While we were looking, the top of the tree broke, and here came the man and the 'possum, with about fifteen feet of tree, to the ground. In the melee the dogs got excited and could not tell the negro from the 'possum, and pounced on him. Amid the peels of laughter, the 'possum got away, but only for a time, as he was soon caught by the dogs on the ground.

The negro is a great believer in ghosts (they call 'em hants for haunts). Certain dogs in our pack have a way of treeing game, and on investigation we find nothing. The darkies conclude at once that they are "chasing hants," and if they go out alone, and one of these "hant dogs" strikes the track first, they call them off. One of my dogs last night while running got into a barbed wire fence without seeing it, and made a noise as if something had hurt him badly. A darkey at once exclaimed, "Dar, now, a hant done slap him!"

The negro is a great believer in the value of the stars as a guide by night, and if they didn't get mixed on them they would prove a veritable compass; but as the old woman said about her ability to tell a bad egg from a good one, "it would either sink or swim, she didn't know which." We got lost for two hours within half a mile of home because we followed the negro and his "seven stairs." When we left home, they were in the east, and later, they got toward the west; but the darkey forgot, or did not know that stars, as well as the moon, are moving bodies.

I have made a long letter in trying to tell you readers what a good thing red fire is on a 'possum hunt, but I couldn't help it. We got four 'possums.

POLK MILLER.

RICHMOND, Va.

The Adirondack Close.

Editor Forest and Stream.

It is publicly asserted that the lives of half a dozen or more millionaires who have bought and appropriated for their private use large tracts of wilderness land in the Adirondacks which have hitherto been open to the public, have been threatened by the settlers or squatters, whom they have sought to evict under their right of acquisition and possession.

Without attempting to discuss the various phases of the situation, which are not the pleasantest imaginable, either for the parties immediately interested or for that very large class of "Adirondack Murray's" followers who annually set their faces toward the forests for recreation, I would suggest to the gentlemen owners of the preserves in question, several of whom I know personally, that an easy way out of a like difficulty was discovered and adopted by the directors of the "Blooming Grove Park Association" in the early days of its incorporation, thirty odd years ago, when the appropriation of large tracts of land by clubs or individuals was a new thing, and quite at variance with the ideas of personal freedom and eminent domain inherited from those who had originally driven out the Indians and "subdued the wilderness" to their own use. We simply made game wardens and camp keepers of the settlers or squatters who had log cabins or houses on the premises, paid them fair salaries, hob-nobbed with them around the open fire-places, and so made them interested sharers with us in the privileges and benefits of the park, which were to be enlarged and promoted by the protection and propagation given to its forest denizens by our joint efforts. Their experience and lifelong knowledge of the tract made them far more efficient, and loyal to the club's interests than introduced hirelings would have been, and their services were obtained at a minimum expense. Several of their sons are helpers to this day; some of them keepers of out-stations at distances remote from the club house.

Of course, there are lots of outsiders, jealous of our prerogatives; and some who live adjacent to the park boundary have made no end of trouble and expense by malicious prosecutions for supposititious infractions of the game laws. But the Association has had upon the whole undisturbed peace for a generation, and I doubt not some similar course of procedure by the princely Adirondack owners would bring surcease of annoyance and anxiety.

CHARLES HALLOCK,

First Sec'y B. G. P. A., 1871-4.

The Mississippi Bottom.

SANDIS, Miss., Sept. 23.—*Editor Forest and Stream:* I took a short trip down among the lakes in the great Mississippi bottoms (it is now very common to call the bottoms the "Delta," and is a mistake, if we understand the meaning of the word "delta"), and oh, how things have changed within the last few years. Two railroads enter and pass through what used to be some of the best and most desirable hunting grounds, and along the banks of some of the lakes. One can hardly get out of sight of a sawmill, timber camp, or railroad; and of course this makes game rather scarce and wild; but really not so much as one would suppose under such circumstances. Reports from timber haulers and choppers say that deer and turkeys are quite plentiful, while the bear has not given up all claims to this long resort of his race. But with the present strides of settling up that great cotton belt, it will be but a few years before that vast territory will be thickly filled with small towns, and all the timber will be cut down and sawed into merchantable lumber; and then one of the finest hunting and fishing regions of the South will be a mere dream. But the vastness of this bottom will yet take several years to turn it into towns and plantations, instead of the "Sportsman's Paradise," as it now is. There is a strip ranging from a point at Lake Cormorant, on the Y. & M. V. R. R., running south for more than 250 miles in length and from 10 to 20 miles wide, that is as wild and dismal as it was a hundred years ago, and there are some few places away down where the Tallahatchie and Lallabunsha rivers come together and form the Yazoo River, that I believe will be unsettled a hundred years later on.

There is one thing the sportsmen have got to see—that the law is enforced, and that a stop must be called on

dynamiting the lakes and shooting game out of season, which is now very common with some men. We have a moderately good law on this subject, but not such as I am anxious to see passed and enforced.

DENNIS.

Down at Chatham.

CHATHAM, Mass., Sept. 21.—*Editor Forest and Stream:* Perhaps you would like to know something about the shooting at Chatham this season, and taking advantage of an off day (a dry nor'easter having been blowing for the past forty-eight hours), I send you the result of two days' work in the boxes. We were favored the past week with strong southeast and southwest winds, which are considered at this place to be the most favorable, and in conjunction with a temperature like mid-summer, the birds seemed to be in no hurry to continue their flight south, and were not at all shy, decoying easily, and nearly every box showed a good bag at night. The following score will give you an idea of the different species of birds usually shot here during the season:

Sept. 14.	Sept. 15.
Brown backs 2	Beetles 38
Beetles 23	Grass birds 18
Chickens 2	Winters 12
Grass birds 23	Red breast 5
Summers 1	Golden 1-74
Winters 5	
Red breast 15	
Golden 1-72	

It is rather unusual not to have had days when we were able to kill at least from 75 to 100 grass birds, but the extremely warm weather seems to have made the feed on the marshes too dry for them, and the few that have been shot are not in the condition of former years. The kind of birds given in the score are what are called at this place large birds, or birds that are swift of flight, although there are a great many sanderlings that offer to the gunners who run down for a day or two a chance to get a little practice. You will understand that with us here it is an unwritten law among the gunners that a bird is to be shot only on the wing (unless crippled), and a wounded bird to be killed, even if a 'gunner has to leave his box to do so. I am pleased also to write that the practice of shooting on the Sabbath is discontinued by mutual agreement, and I can see the effect of this in the class of people I meet here this season as against that of three or four years ago. Should anything of unusual interest occur before my return in October, I shall be pleased to send it to you, for I am much interested in Chatham Beach, with its grand ocean view and the good fellows I meet here, that I feel that you ought to know something about it. HOWARD WADE.

Duck Shooting Extraordinary.

OSSINING-ON-THE-HUDSON, N. Y., Sept. 28.—*Editor Forest and Stream:* This morning while reading the article by L. F. Brown in your issue of this week entitled, "Spurious Writings About Angling and Nature," I was reminded of an article which might come in for a share of attention. It was printed in last Sunday's New York Sun under the heading, "Duck Hunters Who Are Rich." It should have been labeled, "Something Rich for Duck Hunters." I will wager the man who wrote it never fired a shotgun in his life. Here is a part of it, and enough of it. "Old Dick," the star duck hunter of Spesutia Island, tells of "Duck hunters who are rich."

"Good shots? Yes, some of 'em pretty to'ble," said Dick, between pipe puffs, "and the curious part of it is I've seen a man knock down black-head after black-head who didn't know how to clean his gun after it was wet—gave me something extra to fix it for him. I took a man out last spring who brought along as fine a pair of barrels as you'd want to look at, but he didn't seem to be able to shoot at all. I 'member we got up a brace of fine canvasbacks at close range—dead easy shot. I knew he was an old hand from the way he kept his nerve while waitin' and the way he handled his piece, but when they rose the charge went 'way over 'em. We waited half an hour and along came four more—as pretty a shot as I ever saw. He fired just at the right time, but the shot went all over the place—never near 'em. He looked at the sights—they were of the telescope kind—to see if they were adjusted right, and took the piece apart and put it together again, but there was nothin' wrong about it; it seemed to be in first-class shape," etc. Then he goes on to say the man borrowed his old muzzleloader and killed three out of the next five—like the old story of the alder pole and bent pin. There is no use picking it apart, as it is "hash." How the sporting editor of the Sun allowed a duck gun fitted with telescope sights to get action on itself in the paper is more than I can comprehend. C. G. B.

The Old Familiar Charms.

From the Clinton Courant.

FOR we all know that the same blue ocean still surges above us and the same kaleidoscopic variety of clouds flit across the heaven's arch, the same sun journeys from the Orient to the Occident of our vision now as in the olden time, the birds sing the same tunes on the same key as did their feathered ancestors, the verdure of field and forest remains unchanged, the streams and brooks course their way through equally attractive landscapes, and the man in the moon as graciously smiles down upon the hills and vales as he did in the years of yore. The supernatural charms of that landscape which we, whose youthful home was in the country, so thoroughly enjoyed, and the apparent loss in scenic attractions as the years go by, have a ready and satisfactory explanation.

Those mountains of cloud which we vainly attempted to fathom and measure—that dazzling sun which daily toured the sky, spanning long days of innocent pleasure—the birds which favored us with hallelujah chorus as a sunrise accompaniment—the stream on which we sailed and in which we sported—the brook in which we constructed dam, dike and reservoir, with no damage to the marginal owners—and the moonlight evenings when all the world was hushed to peace—these several attractions all came to us as our introduction to a world of many and varied beauties, making an ineffable impression upon the then unsullied tablets of our memory; then we were new to the world and the world was new to us. In later

years, while similar experiences gain from us but slight permanent notice, remaining as a partial blur on the memory, those early first impressions are retained in their original distinctness, and come back to us at our bidding in the revival of the long ago which comes with the return of home week; and so we again see our early home, meet the friends of other years and once more hear familiar voices which have long been silent, but are not forgotten.

A View of Maine.

MALDEN, Mass., Sept. 25.—*Editor Forest and Stream:* The smell of frost and the rustling leaves makes me think of Maine. But shall I go? I see that our friend Kinney, of Worcester, says that the Worcester gunners are going to New Brunswick instead of Maine. As near as I can learn what is true of Worcester is true of the rest of the State. Perhaps from no city of its size in Massachusetts has there been so large a delegation of hunters to Maine as from Malden; but this year it is different. I can count with the fingers of one hand all who have expressed their intention of going; but there is now a large number in New Brunswick, with two parties to start this week. I am a native of Maine, but I must admit that for the first time I am a little ashamed to own it. They have an impression that we have got to have their game, but we will let them see. We will let them run their empty trains; we will let the farmer and storekeeper keep their potatoes and their groceries. We will let the guide wait at the wharf and the station for his patrons, from whom he has decided that his services are worth four dollars per day, but who is content to work the balance of the season in the logging swamp for \$25 per month. E. M. W.

Five Wagon Loads of Minnesota Ducks.

ST. PAUL, Minn., Sept. 30.—The State Game and Fish Commission received word yesterday morning from Jackson, Minn., that five wagonloads of ducks which were shipped from Heron Lake out of the State were seized near the Iowa line. The seizure was made by Capt. Bird, a member of the Commission. The Commission has had a great deal of trouble protecting its game in the vicinity of Heron Lake, and the seizure is regarded as a very important one.

Last year this gang was broken up, but they are at it again, with ten men employed and each to average 100 canvasbacks or redheads per day.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Musings at Sand Lake, Michigan.

III.—A Glance at Some Fragments of its Indian History and the March on Toledo from Tecumseh, in 1836.

"On Marquetuas' flowery marge,
The red chief's wigwam stood,
Before the white man's rifle rang
Loud through the echoing wood.
The tomahawk and scalping knife
Together lay at rest;
And peace was in the forest shades
And in the red man's breast."

—Michigan School Ballad.

At least a few drops of the wild, savage blood of primeval man remain in every sportsman, no matter how "cultured" he may be—the slave of conventionality and civilization, the busy user of the trolley, telephone, and limited railway train, the stock-ticker and wireless message. He may scamper over Europe and stare at the "old masters" in a dozen galleries, eat elaborate course dinners at the Cecil in London, or the Waldorf in New York, and chat with the Boston savant about Psychic Research as he speeds in the automobile along Commonwealth avenue; but there is that inside of him which sometimes calls for life in the tent; for the camp-fire, the noonday lunch of roasted fish beside lake or stream, the sighing of winds through woods, and the whispers of waves on beaches as they tell their story to its rocks and pebbles.

So the angler here at Sand Lake will not only note all these factors of Nature's hypnotism, but will dream of what the savage life must have been in that long ago when the Stone Age man or the dusky Indian belle fished here, and watched this panorama of bluffs, woods, waters and flowers. What manner of men were those old lake-dwellers? Did they have a religion? And what were its rites? Did they have a language of their own? What did they eat and wear, and how did they secure it?

These, and a hundred other queries, will grow in interest, until he may search the libraries, question aged residents, write dozens of letters, read the journals devoted to American Folk Lore, and mourn over the scanty and meagre facts, and that the legends and traditions are nearly always so fantastic and unreliable.

And here at Sand Lake, nearly every mail brings to us some new proof that almost nothing is known of the life of the red men of this region. The Pioneer and Historical Society, with rooms and a library at Lansing, has published thirty volumes relating to Michigan history; and it has a few unverified old manuscripts of interest; but few real messages come from that olden time. Almost the only real facts have been obtained by personal conversations with old residents, who tell the stories of the red men as told to them by the aged white men when they were boys. Special acknowledg-

ment is here made of the service and courtesy to us in this matter, extended by the octogenarian, Mr. Charles F. Dewey, of Cambridge, who came to Lenawee county in 1829, and who is yet hale and hearty.

The writer does not vouch for the authenticity of the legends given here; taken from books that cite no real authority for them. But the facts furnished by three or four old citizens as having been handed down to them from their fathers and friends, are fairly authentic—always subject, however, to the objection that it is next to impossible for any man to relate Indian "history" without "romancing."

The earliest known Indian history of the Sand Lake—Prospect Hill—Tecumseh region seems to begin about 1735, when a sub-tribe of the Algonquins had villages at

A NOONTIDE LUNCH.

Sand, Devil's, Wolf, and Allen's lakes. Some of the names of their chiefs were Man in the Clouds, Tall Chimney, Black Wolf, Comes by Water, Blue Cloud, and Maize Grower. These names purport to be translations from the Algonquin equivalents for them. About 1775 this sub-tribe, which extended at least as far as Morrison's Lake, near Coldwater, south to Angola, Indiana, east to the Detroit River, and north to Long Lake in Genesee county, were decimated by the smallpox, which had been brought by a Wyandotte Indian from what is now Lake St. Clair. The different villages established a partial quarantine against the disease. A famine followed, and in the war that resulted from the non-observance of the quarantine, the region was left with almost no survivors.

This handful of Algonquins became a part of the comparatively numerous tribe that came into the region about 1800, and known as the Pottowottomies. They certainly had one village near Sand Lake, and one between Wolf and Allen's Lakes in 1815. The chief in charge was named Meteagah, a tall, thin Indian, who had a wigwam of birch bark imported from "across

thunderly midnights at the top of the "wādtchu," or what is now Prospect Hill. He claimed power to talk with the bears, wolves, foxes, wildcats and catamounts, then plentiful there. He made a monthly (moon) journey to see a sister who lived near White Pigeon, and followed a "trail" through what is now Addison, Wheatland, Jonesville, Coldwater and Sturgis. The tribe had burial places near Tecumseh, and near Siam, and another on Section Eleven of Cambridge Township, Lenawee county. The remnant of this sub-tribe was removed to some reservation, and their villages were abandoned in 1830.

Their burials are said to have taken place at dawn, the corpse being placed with the head to the rising sun. Some grains of the corn from their scant fields, a small piece of deer meat, a deer bladder full of water, a knife, bow, two arrows, and a tomahawk, were buried with a warrior. Squaws were buried with the head to the west, and with nothing, it would seem, to help them by way of food or weapons when they reached the "happy hunting grounds."

They worshipped the Great Spirit, who lived above the stars and kept a sleepless vigil over all. They assembled once a month (moon) and faced in a body to the east before a fire of birch, and sacrificed deer meat to this deity. They had wordless songs of reverence and entreaty, which contained prayers for the ill, and for success during the hunt, and in war. These songs were carefully taught to their young men, and handed down by an official "Wiladtcuppen," or song-keeper. They often endowed the largest trees with a personality that was supernatural, and under them the tents and "shacks" were sometimes placed. At Wolf Lake was a supposed snake, about forty feet long, which had to be placated with offerings of birds and meat—a water deity.

Their language was a *patois* of the Algonquin. Here is a list that was taken down in 1810, of a few of their words, by a settler or trapper named Ross, who camped and hunted at the "hill" (Prospect) lakes, and whose great grandson, Mr. C. W. Marshfield, now nearly seventy years old, handed to me here in New York last year:

Fish	Pabsi
Canoe	Molchu
Lake	Poagan
Great Spirit	Manitou
Woman (squaw)	Lapsi
Muskrat	Fubgro
Bear	Olachumli
Deer	Klabtowoli
River	Chumcatat

The list could be considerably extended. At best, it was merely the sounds, crudely written in English, as pronounced by Indians, to an unlettered, probably ignorant trapper. But some of the words show their Algonquin origin. For example, "pung" was a sled, pure Algonquin, as was "netomp," or "my friend." But I leave the subject for the antiquarians, merely stating that some of our best-known words come from the Algonquin language, as chipmunk, totem, terrapin, woodchuck, persimmon, porgy, coon, pone, and caucarouse, or a head man—chieftain.

But we leave the subject—it is too obscure.

ONE OF THE LANDINGS AT SAND LAKE.

the flowing water," Canada. He had from six to a dozen wives, was left-handed, smoked dried leaves, and carried an eagle's wing pendant from a wampum belt, as a symbol of his rank. His royal head-dress was made of untanned buckskin sewed with deer-thongs; his moccasins alone were stained red with chokeberry juice, and his was the only canoe at Sand Lake which was entitled to two paddles—the chief's prerogative.

He had charge of the village for about twenty-five years, and was succeeded by "Siam," a lazy, dirty tribesman, who had "cured" diseases by making signs, mumbling incantations, and pouring deer blood and the dry gratings of wild turnip moistened with cherry juice, down the throats of his ill victims. He had a bow of ebony, arrows tipped with rattlesnake poison, and claimed that he had frequent talks with Manitou, the Great Spirit, who visited him under an oak tree on

One well authenticated custom was the forcible carrying from her wigwam of any Indian girl whom a brave desired for a wife. In Siam's village at Sand Lake as late as 1815, a girl so seized killed her assailant with a single blow of a tomahawk. But even when a girl desired to be the wife of her abductor, she kicked and squallied and resisted as if that were the last thing she wished. Women, savage and civilized, often have this trait.

Even in 1829 the Siam village was little more than a camp of squalid Indians, dependent on the bounty of the Government. They started for Malden, with others from the West, in August of that year. Mr. Dewey, the old resident of Cambridge, writes me that "on their return they stopped on the trail that passed our house (about 400 of them), having blankets, guns, shoes and coats, but especially considerable money, and more whisky in deer bladders. They were very

noisy, yet seemed to be under control of certain squaws, one squaw to each division. They would 'mind' her when the chief could not keep them quiet."

But more interesting history, and well known, is that of the pioneers who were settling in these Prospect Hills for twenty years before, Jan. 26, 1837, when Michigan, the thirteenth State, after the thirteen original ones, was admitted into our Union. The woods below Prospect Hill were even then showing many patches of clearings. What a hardy, self-reliant, brave, hustling lot of men and women those settlers were! They showed their native courage when the State of Ohio confiscated their southeast region, in order to secure a port on the lakes at Toledo. The territorial governor of Michigan, Stephen T. Mason, the former secretary of the greatest man Michigan has ever produced (Lewis Cass), called for volunteers to "repel boarders"; and from these very hills at Sand Lake about sixty men left their cabins and joined the "army" of over two hundred men that gathered at Tecumseh, about nine miles east of this lake. They carried flint-lock muskets. One battalion, said to have been led by a son of Gen. J. W. Brown, had charge of the army's one little cannon. In testing it before starting for Toledo, they fired it too close to the bass drum, and burst one of its "heads." One of the soldiers, Asa Gilmore, became famous. He marched to the strip of disputed territory with his "regiment," under Col. Smith. On arrival at Toledo it was found that the Government had promised the Territory of Michigan what is now the Northern Peninsula of that State in exchange for what Ohio claimed at Toledo. This was satisfactory; but private Asa wanted some gun-firing anyhow. He stepped out from the "line" and asked permission to burn powder. So the Colonel arranged what he called a surprise in the camp. It was awakened at midnight by a scattering volley from a few of the old flint-locks, and rose to defend itself from a night attack. Asa loaded his old musket as often as ordered, but forgot or was afraid to fire. He got five or six charges into his gun, when his fear to fire it left him, and he "blazed away." The gun burst, doubled, knocked him down and filled his face with grains of powder, which he carried to his grave. He is said to have applied to the Territory for a pension, which was refused. He was the one wounded veteran of the bloodless Toledo war—a very triumph of comic opera campaigning. His ruined gun is preserved at Lansing as a souvenir.

That was almost seventy years ago. How different from the "forced march" of that plucky band, is the ride of this train-load of passengers, excursionists from Toledo, over the Lake Shore road. We reach Toledo from Pentecost station, near Sand Lake, in less than an hour, doff our brown jackets and outing shirts, help to eat the four black bass we took this morning at the lake, and smoke and chat with our host before taking a train for the East.

But we know that the joys of our outing will linger in memory. Beautiful Sand Lake! May its shores, green for centuries, still show their beauty, and attract sportsmen to their hospitable cottages and tents, when we, in turn, have been forgotten.

L. F. BROWN.

The Flight of a Flying Fish.

I HAD intended to say considerable about a second visit recently paid to that "abode of the blessed," Avalon, but a writer in a late number of FOREST AND STREAM has, with little regard for my feelings, said most of it, and thereby stolen my thunder. I cordially indorse his sentiments on the subject of fishing as carried on at Avalon, and the senseless slaughter attending it, but I think he has neglected some of the more pleasing features, among them the glories of the big glass bottom power boats, and the wonders of the pictures they show one. The boats themselves are so large and comfortable, and, drawing as they do only about a foot of water—the largest draws only ten inches—they carry one through scenes of enchantment extending for miles, the like of which is to be seen nowhere else on earth under such favorable conditions. Then, too, he had nothing to say of a trip of sixty miles around the island that was to us, though devoid of accident or even incident, a keen delight of eight hours' duration.

I dwelt at some length in that article which I wrote for, but shall not send, you, upon the pranks and antics of the kids of all ages in the water and out of it, and of the walks and rambles about the island, with a word for the band that seems to me the very best band of all the world, just because it plays at Avalon; then there was "The Gibson Girl," and the "Cake Walk Girl," and—well, you've missed a whole lot of things I was going to tell you, but what I am really inflicting this screed upon you for is to take issue with your correspondent on the flight of a flying fish. It doesn't seem to me that he has got it just right.

On the trip from Los Angeles to the island and back, and going around the island, I had many chances to study the subject, for the fish were plenty and incidents few to distract the attention; and here is the way it seemed to me.

In the first place, the fish didn't leap from the water and fly through the air. He popped his head out, spread his great pectoral fins and sailed along with his tail in the water working like mad; seen from astern it was a blur. This continued for a hundred feet or even a hundred yards; suddenly his ventral fins opened like another pair of wings, and this raised his tail out of water, and he sailed along on a line parallel and not more than a couple of feet above it. Now if while sailing along in this way he sank near enough to the surface of a long swell to reach it with his tail, the ventral fins were closed, the propeller started up, and he got a fresh impulse.

I saw one fellow who in the course of a flight of considerably over a thousand feet (I think it was a great deal over a thousand feet), partly at right angles to the ship, and partly parallel, got no less than six fresh starts. When they stopped the fish generally plunked head first into a wave, as if they had miscalculated the height. As a rule the fish went in a straight line just as he happened to have been started, and when he turned it was as though he had been swerved by the wind, or

had held one fin higher than the other, or something of that sort. There were no birds pursuing them, so I had nothing to tell me whether the fish could dodge or not, nor were there, apparently, any fish in pursuit of them. It is quite probable that in the latter case they would have sprung much higher from the water; for I remember that on one occasion when I was on my way to Honolulu, the second mate brought me a flying fish which had flown into one of the boats hanging from the davits of the quarter deck on a bark of about four hundred tons. I had him for breakfast and he was by no means bad eating.

The flying fish is a rather nice looking fish when he is dead, but when he is alive and skimming through the air he looks like a streak of iridescent glass, mother-of-pearl, and all that sort of thing; but I don't think he ever really flies an inch, the apparent motion of his "wings" being really the play of light on the surface of the wet fins. The fin is not a wing, but a true fin, though set higher on the shoulder, and much larger than in other fishes. ***

Pollution of Lake Champlain.

THE copious extracts published by all the leading New York daily papers from the article on the pollution of the waters of Lake Champlain which appeared in last week's issue of FOREST AND STREAM, indicates that a widespread interest has been aroused in the matter, and may be taken as a token that this time the fight against the mill owners will be fought to a finish. That the latter will finally be compelled by the courts and by force of public opinion to abate the nuisance may even at this date be accepted as an accomplished fact.

It is expected that within a few days the results of the official investigation of the waters of the lake and the Bouquet and Au Sable rivers recently made by Prof. Olin H. Landreth, consulting engineer of the State Department of Health, will be placed in the hands of Governor Odell. It is expected that the latter, on the basis of the report, will proceed to force the local health officials either to close up the mills or to adopt some effective method of getting rid of the chemical refuse that now finds its way into the lake. If action in the case is long delayed by Governor Odell, it is the intention of those actively interested in fighting the mills to apply to the Supreme Court for an injunction to close up the mills, and it is believed that this can be done.

Although in the past all attempts to put a stop to the pollution have failed, it is purposed that now there shall be no failure. But it will not be a walkover by any means. The power of the pulp mill owners has been evident during the years that complaints have kept coming into at least two departments of the State, for in spite of the fact that the Forest, Fish and Game Commission has in a manner investigated the nuisance, and the State Board of Health, in its annual report for 1899, published an analysis of the water in Au Sable River which showed that the water was impure and that the pollution was due to the pulp mills, the trouble has not been lessened.

Said Mr. Edward Hatch, Jr., who, as a large property owner in the Lake Champlain region, has been actively combating the pulp mill nuisance: "Although this fight has been on nearly ten years now, we have never despaired of ultimate success. It was only last spring that the New York Legislature was importuned to take action to compel the manufacturers to dispose of the waste in some other manner than by dumping it in the streams which flow into the lake, as there are many acres which these companies own and can use for a dumping place. This was done for a time, but after a showing had been made, they again allowed the chemical discharge to escape into the streams. The discharge from the mill on the Au Sable River in one day amounts, it is said, to nearly 200,000 gallons containing about one per cent. of sulphurous acid; while the mill on the Bouquet River in its manufacturing uses a strong caustic liquid of soda and lime, and gives off a discharge equally large. It is not difficult to understand the action of these chemicals upon all forms of life with which they come in contact. Large quantities of fish are found dead as a result of meeting with this poisonous outflow, and the rocks along the shore for many miles are coated with a white slime which makes it a public nuisance as well as a destroyer of life.

"The pollution of the water is especially noticeable in the winter when the lake is frozen over and it is possible to detect the discharge of the chemicals by their color.

"Opposite the mills, which are about half way down the lake, is the city of Burlington, on the Vermont side, which draws its supply of water from the lake. Recently there have been many complaints of this water, and a plan for moving the intake further out into the lake has been discussed. It is my belief and that of others who complain of the pollution, that the deterioration of Burlington's water supply is due to this cause. They have explained their views to Governor McCullough, who has interested himself in the matter. It is probable that the authorities of that State will take action through the United States courts to restrain the continuance of the abuse.

"In my opinion the best speech by far delivered at the recent meeting of the Fish and Game League of Vermont, was that of Justice D. J. Brewer, of the United States Supreme Court. He referred to the preservation of the fish and game of the country, both for game and for food supply, as a serious matter. He had three suggestions to make: Never destroy fish or game for the fun of it, as the early settlers of the country did. Stop the destruction of fish by the pouring of poisonous drugs from the mills into our streams and lakes. That was a duty we owed to ourselves and future generations. We all owed something to each other, and in those matters we had no right to do that which destroyed the rights of another. We should cultivate and replenish our stock of fish. An acre of water is worth as much as an acre of land for production, but it needed cultivation the same as land. He was glad to see what the Government was doing in that matter, and hoped it would do even more."

Mr. Hatch, among hundreds of other letters bearing on the subject, has received the following communication from one of the leading city officials of Burlington: "The people of Burlington have enough to contend

with already without being forced to face the possibility of poisonous chemicals from the opposite shore of Lake Champlain being drawn into the supply pipe of our water system which extends beyond Appletree Point. It is difficult to see why the pulp mills cannot dispose of this waste on land without serious loss or marked inconvenience, and it is to be hoped that the matter will be agitated on both sides of Lake Champlain until this nuisance and menace to both our fishing interests and the public health is abated."

Another letter reads:

"Besides the contaminated waters, however, there are other evils. On the New York side there is little effort made to prohibit illegal seining. I do not believe there is a night in the summer when they are not dragging nets. I see men going by my summer place with nets in their boats, and I hear of it almost every day. At the mouth of the Au Sable are twenty or thirty boats, owned by people back in the country that, I am told, are used at night in the dragging of seines. It indicates a laxity on the part of the game wardens if not indifference or actual connivance. There are enough people, I am sure, who are residents of the State of New York, who spend their summers on Lake Champlain, who, if they would exert an influence, could create a sentiment which would prevent a contamination of the waters and illegal fishing."

Oct. 6.—Since the foregoing was written the matter has assumed a serious aspect, one that may yet end in bloodshed and murder. The life of Mr. Hatch has been threatened, and threats have also been made about destroying his property on the lake.

Mr. Hatch, who has just returned to New York from a visit to Lake Champlain in the vicinity of the pulp mills where his property is located, spoke freely to a representative of FOREST AND STREAM about this latest development in the prolonged fight between the lake residents and the mill owners, which seems likely before long to end in favor of the former. But the victory may be dearly bought. Said Mr. Hatch:

"It was while at Keeseville the other day that I received the first intimation that my life was in danger on account of the determined stand that I have taken in the Lake Champlain pollution matter. Keeseville is situated on the Au Sable River about twelve miles below the pulp mill factory of J. & J. Rogers, and has a population of about twenty-five hundred.

"While standing on the porch of the main hotel there, I was approached by a man dressed in a workman's garb and who appeared to be a bit the worse for liquor. 'So, by God!' said he, 'you're the one that's bent on closing the factories, are you? Let me tell you that if you're not damned careful there'll be another Dexter case up here and a whole lot of excitement. Somebody else is liable to be shot in the back, you know,' and saying this he walked off shaking his fist and scowling menacingly.

"I subsequently learned that since the publication last week of the article on the pollution of Lake Champlain in the FOREST AND STREAM, in which I freely expressed my views, and which article was freely quoted by the prominent New York papers, my life has been threatened more than once. In addition to the direct threat which I received, I was subsequently told by friends in the mill region roundabout that I had imperilled my life by my attitude in the pulp mill matter, and that it would be better for me not to go about unarmed and alone.

"I have no fear, however, of any evil consequences, and despite the warnings of friends who declared that in justice to myself I should protect myself with guards, I went about unprotected in any way during the remainder of my stay there, frequently taking long drives through the woods, and met with no mishap whatever.

"As far as the mill owners and myself are concerned, there is no personal enmity that I am aware of. On the contrary, our social relations are of a very friendly nature. It is only the very lowest riffraff in the community about the mill region who could possibly misunderstand my attitude in the matter, and thus look upon me as an enemy bent on taking the bread out of 'their mouths, as it were.

"As a matter of fact I do not want to close up the offending mills, and thus throw hundreds of people out of employment. I simply want the mill owners to obey the law and discontinue their pollution of the rivers and lake. When it comes to a final test I am sure that rather than close the mills their owners will spend the necessary money and find other means of disposing of the mill refuse than by dumping it into the waters of the lake."

Mr. Hatch said that he intended to return to the mill region again in a few days, and declared that he had no fear of personal violence. "I'm in this fight to win out," concluded Mr. Hatch, "and all the threats and bluffs in the world won't stop me."

Vermont's Fishing Interests.

From the Burlington Free Press.

THE eloquent appeal made at the banquet of the Vermont Fish and Game League by Justice David J. Brewer of the Supreme Court of the United States for the preservation and development of our fishing grounds, ought to result in the adoption of measures for the purpose of carrying out the excellent suggestions made by our distinguished visitor. His remarks about the value of our fish supply and the duty of every man to seek to conserve our fishing interests, while applicable to every body of fresh water in the State and throughout the country, applies with particular force to Lake Champlain.

We fully realize that determined efforts have been made by our leading sportsmen as well as by members of the Legislature to secure the co-operation of Canada with the authorities of New York and Vermont in the adoption of measures to stop seining, especially during the spawning period. We also fully realize the force of the argument brought to bear by those who show that our Canadian cousins haul seine after seine just across the imaginary line constituting the international boundary and ship carloads of fish to the markets of our larger cities, and urge that the income from this work might as well be enjoyed this side of the line as on the other side. This consideration does not diminish the force of Justice Brewer's assertion, that no matter what law may be on the statute book, no man has a moral right to disregard

the rights of the people as a whole in the matter of protecting and promoting the multiplication of fish.

Justice Brewer rightly appealed to the sense of right, and such an appeal ought to prove effective with all classes having to do with our fishing interests. If such an appeal will not cause men to stop the wanton destruction of fish in Lake Champlain by the wholesale, there is possibility of meeting those communities which stand for seining in Lake Champlain on their own ground.

The only benefit which a community receives from the liberty to haul seines within its boundaries is the circulation therein of the comparative pittance which fishers receive from the sale of the fish thus taken. Now compare this small benefit to the results which would follow were Lake Champlain so well stocked with fish for angling that our shores would be lined with cottages and summer cottages for the accommodation of summer visitors attracted here, in part, by our excellent fishing. Would not the large sums of money thus attracted to these shores from the large cities and brought here by tourists from all parts of the country, far surpass the amounts received from the sale of fish taken in seines?

If it be urged that even excellent angling might not mean the realization of the picture thus painted, it can be stated on the authority of those whose interests lead them to study the subject of attracting summer visitors to Lake Champlain that the lack of good fishing with hook and line is one of the most serious objections that they have had to contend against. They come into contact with tourists and know the appeals which tend to attract tourists to other places where good fishing constitutes one of the best drawing cards.

An immense hotel is to be erected on one of the islands of Lake Champlain in the near future by a corporation as an experiment; and if the experiment is a success it requires no argument to show that other structures of this character will speedily follow. It is the duty of the residents of the Champlain Valley to do everything in their power, speaking from a purely selfish standpoint, let alone the common welfare, to spare no reasonable effort to assure the success of this experiment. Instead of clamoring for the privilege of drawing seines, every town on Lake Champlain should see to it that no seines are used within its borders to deplete the stock of fish in Lake Champlain. We cannot hope to convince our Canadian neighbor that he should not draw seine, while we are pulling out loads of fish as we talk to him. Someone must stop seining first, and inasmuch as we shall have summer hotels before our neighbors, it will not be unreasonable to ask that people on this side of the boundary set our neighbors the right kind of an example.

Fish and Fishing.

The Salmon Season in Newfoundland.

MR. W. F. J. McCORMICK, who wrote the interesting details recently given to FOREST AND STREAM of the catching of Newfoundland salmon with bait, furnishes me with valuable information respecting some of the salmon rivers of the Island Colony, and the catches of the recently terminated season. Of the Little Codroy River, from which he wrote, Mr. McCormick says that the fishing there has been worse than in any other part of the island, owing to the crowd of inexperienced persons—not anglers—who have been thrashing the unfortunate stream ever since July 1. Only eight miles in length, and containing but four pools, it has been forced to support a daily average of ten "fishermen" with tackle ranging from a 3½-ounce bamboo trout rod to an English telegraph pole 24 feet long, and heavy enough for a cargo boom on a tramp steamship. Though the Little Codroy fish are not exceptionally numerous, they seem to run large for Newfoundland. Mr. McCormick complains, however, that their fighting powers are not very great. He killed a 31-pound male on the 22d of August in eight minutes. It made but one run and came in nearly dead. He would like to know what is the matter with the fish here, and suggests that they may feel the want of exercise, since the river is very shallow, so much so that it can be waded almost everywhere. Excluding all fish under ten pounds in weight, the following is a list of the salmon killed by Mr. McCormick in the Little Codroy during the first three weeks of August: One of 23½ pounds on a No. 2 silver-doctor; one of 43½ pounds on a No. 1 black-dose; one of 12½ pounds on a No. 4 Hornsby; one of 11½ pounds on a No. 6 Jock-Scott; one of 19 pounds on a No. 4 Hornsby; one of 31 pounds on a No. 2 silver-doctor; one of 16½ pounds on a No. 2 dusty-miller; one of 15 pounds on a No. 2 Jock-Scott; and one of 10½ pounds on a No. 8 silver-doctor. The last mentioned fish was taken on a trout rod on the 25th of August, and the 19, 31 and 16½-pound fish were all killed in about two hours' fishing on August 22. The 31-pound fish is the largest taken this year in the Little Codroy. Mr. McCormick reports that in addition to the large fish mentioned above, he killed a large number of grise from 3 to 8 pounds, and about thirty brook trout from 2½ to 4¾. The best trout fishing, however, this year was in the Gander River. The fish were plentiful about the 1st of July, ran large and took the fly well.

Mr. McCormick believes that he has found out the trouble with the lower Humber and the reason why there is little or no fishing in so promising-looking a stream. It was near its mouth in the Bay of Islands for several days, from the 2d to the 7th inst., and fished for trout at the first big rapids with fair success. The salmon will not stop in the river, however, below Deer Lake on account of the large number of seals with which it is warming. My informant saw six in one small pool at the same time. The Bay of Islands district gives a bounty of \$1 per head on seals, but not apparently with much effect. Molt are plentiful in the river, and in fact a perfect nuisance to the trout fisherman, so that there is every reason to hope that in time the upper waters of the Humber will be well stocked with salmon.

Very Large Trout.

I cannot remember any previous year in which there have been so many large trout killed in this country, as during the last two months of the season which has just ended. From every part of the Province in which large

trout are known to exist come reports showing that the biggest fish have been easily taken on the fly. The excellence of this fall fishing goes far to compensate for the very indifferent sport enjoyed during the spring and early summer. Mr. A. W. Hooper, of New Haven, returned here from Commissioners' Lake on the 2d inst., having killed during the last few days of the season several fish running from 1¾ pounds to 4 pounds. He also lost some very large ones in consequence of bad hooks.

But by far the greatest interest aroused by big trout this season was that manifested in a catch of fish recently brought to town from the big lake Jacques Cartier within the limits of the Laurentides National Park. This lake is very inaccessible, being only reached by two or three days of very hard work, though not more than about seventy miles from Quebec. The road to it has been practically deserted for so long a time, however, that it is in parts well nigh impassable for a horse and buckboard, and would scarcely be recognized by John Burroughs as that traveled by him thirty to forty years ago. Very large trout had previously been taken out of this lake, but none so heavy as one brought thence a few days ago, which turned the scales at 9 pounds.

Speaking of heavy trout reminds me of an illustration which came under my notice the other day of how some big fish records are made. A Toronto newspaper reported that a beautifully spotted trout had been captured by a well-known clergyman of that city in an inland lake of Ontario which weighed over 17 pounds. The item was no doubt perfectly correct, for lake trout of very much larger size have been taken out of Ontario lakes, and the lake or salmon trout (*namaycush*) is certainly a very beautifully spotted fish. But as paper after paper copied the item all over the country, for the Toronto divine is a very well-known and popular fisher of both men and trout, the spotted trout became a "speckled trout," this latter adjective doubtless appearing to the editors to be the better one. So people were seriously asking themselves whether it was possible to catch a 17-pound *fontinalis*, and whether the Rev. Dr. Langtry's trout was not a record breaker; for, as in the case of the "cowslip on the river's brim," a trout is a speckled beauty without distinction of variety to the ordinary newspaper reader, and it is nothing more.

Cognate to this subject is that of the reported catch of several sea salmon of late in the St. Lawrence, in the vicinity of Cornwall or Barnhart's Island. Were these fish *namaycush* or lake trout, or what were they? I am not aware that any species was examined by anybody competent to decide the question. Salmon have inhabited the waters in years gone by where these fish were taken, but there is no reason for believing that they have again ascended the St. Lawrence so far, and if they had they would not take bait or a spoon so far from the sea. It has been suggested that these fish were rainbow trout. It is well known that for some years past Lake Titus, on the American side of the river, has contained these fish, and that specimens weighing at least 10 pounds have been seen below the dam there in spawning time. Being somewhat of a migratory fish it is quite possible that they may have run down the Salmon River into the St. Lawrence, in which case they would be very likely to be taken in the vicinity of Cornwall. The proper examination of a specimen would of course soon settle the question.

In the Footsteps of Cotton.

Charles Cotton built a fishing hut on the bank of the Derwent in Beresford Dale, and it is reasonable to suppose that he made frequent use of a footpath leading by the hut. Concerning this footpath there has arisen a dispute, the present owner having closed it against the public. Beresford Dale is on the borderland of Staffordshire and Derbyshire, and to-day it is quite as favorite a resort of anglers as in the days of Walton and Cotton. There is another footpath on the opposite bank of the stream, but it does not permit a near approach to Cotton's hut, and this is a privilege which the occasional visitors to the Dale, acting through the local Footpaths Preservation Society, are striving to regain.

Mysterious Movements of Fish.

How remarkable are the pilgrimages of some of the immense shoals of fish in the ocean! It has been well said that the laws of their wanderings still belong to nature's mysteries. I hear through friends who have been salmon fishing in Scandinavia that vast armies of herring have appeared off the west coast of Sweden, and that the fisherfolk are reaping a rich harvest. These fish have now been absent for a quarter of a century. During the middle ages the herring fisheries of Sweden produced great wealth, but the herring unaccountably disappeared for three centuries. They reappeared at the end of the eighteenth century and at the middle of the nineteenth, just as they have during the present season.

Wisconsin Muscalonge Fishing.

MILWAUKEE, Wis., Sept. 18.—*Editor Forest and Stream:* I cannot resist answering two articles which appeared lately concerning the different baits used in taking muscalonge in northern Wisconsin lakes. The statements that amused me the most were these: "One does not recollect any instances of muscalonge being caught on frog bait. The most up-to-date method of taking the educated muskie would seem to be by casting a sucker minnow weighing about a pound. The frog, for one reason or another, is not commonly used by the muscalonge fishers of the Wisconsin district."

Allow me to suggest that this poor unsophisticated writer should be sentenced to thirty days of solitary muskie fishing in northern Wisconsin, with nothing to eat until he should catch a muscalonge "casting a sucker minnow weighing about a pound." Perhaps that might enable him to write articles from experience, and relieve him of that terrible strain of drawing so heavily upon his imagination.

I have fished for muskies for fifteen years in fifty lakes in Wisconsin, and find that casting a frog on a weedless hook without a spoon is the most enticing bait and used more by the best fishermen than any other bait. Of

course, a minnow is the natural bait for muscalonge, but is not used as much as frogs for several reasons. Minnows are not easily obtained in a great many localities; they do not wear as well as frog and cannot be handled as well in casting unless they happen to be just the right size.

I think the next best bait is a plain spoon with a few bright feathers and a single hook. A single hook reduces the chances of being caught in the weeds; and, besides, it is not considered sportsmanlike to use more than one hook.

Now, concerning that "Casting a sucker minnow weighing a pound." In the first place it is almost too absurd to talk about. There is not a casting outfit manufactured for inland lakes fishing that can stand the strain of casting a pound weight; neither could a sportsman be found who could stand the strain for any length of time.

I have fished for muskies every day for the last three months and used frogs for bait two-thirds of the time—always killing the frogs before using. I have no record catches to brag of, as I do not measure my sport by the number of fish taken, but I had excellent fishing all summer.

I shall write you again sometime giving a more detailed account of my experiences fishing for muskies in Wisconsin and shooting chickens in the Dakotas.

The Largest Bluefish.

IN FOREST AND STREAM, June 25, 1874, it is noted that a bluefish weighing 25 pounds was caught with rod and reel at Cohasset Narrows, Massachusetts, by L. Hathaway, a veteran fisherman. This appears to have been a record fish, for the vague reports of forty and fifty pound fish in New England prior to the American Revolution must be regarded with some suspicion. Jordan and Evermann, in their "American Food and Game Fishes" (1902), says: "The largest bluefish of which we have any record weighed 22 pounds and had a length of three feet."

I now have to announce the capture of what may prove to be the largest bluefish of which an authentic and definite record exists. Mr. George E. Orpin, keeper of the Maddequet life-saving station at Nantucket, writes to the Bureau of Fisheries that in the latter part of September, 1903, Nelson P. Emer, surfman at the station, caught from the beach a bluefish 3 feet 9 inches long which weighed 27 pounds.

Vaccination Against Distemper.

FOR a long time the term vaccination had only a single meaning, indicating the introduction of the virus of cowpox into the system of the human being for the purpose of preventing an attack of smallpox. In the present day, however, the term is used, and for some time past has been used, to include the introduction of any modified virus into an animal's system for the prevention of the disease from which the virus has been derived. Vaccination, however, as it is ordinarily understood, was at one time in great favor, and probably is still with some persons, as an infallible preventive of distemper in dogs, and distinguished medical men have asserted that a long experience with the matter of cowpox taken from a vaccinated arm and inoculated into your dogs by means of passing a piece of thick cotton dipped in the matter through a portion of the inside of the ear has proved an infallible preventive of distemper. It is, however, perfectly well known that, as the result of direct experiments, the virus of cowpox has absolutely no influence whatever as a preventive of the disease of the dog. There was one great difficulty in connection with the attempts to obtain a modified virus of distemper. No one had been able to isolate any specific organism which had the power to produce the disease. Some years ago it was believed that that difficulty had been overcome, and that the microbes of distemper had been discovered. Two organisms had

been isolated, and it was alleged that inoculation with pure cultivation of these bodies in succession caused genuine distemper. Nothing of a practical character arose from the experiments which were instituted. In 1896 Professor Lignières is recorded by Mr. Henry Gray, M. R. C. V. S., of Kensington, to have detected the specific organism, a *cocco bacillus*, one of a large class, found in fowl cholera, swine fever, guinea pig distemper, white scour and lung disease of calves. Dr. Phisalix, professor in the Laboratory of Pathology and the Natural History Museum in Paris, pursued the investigation, and his results during the last two years lend support to the view that a true vaccine has been found. Last year we commented on the report by Dr. Phisalix, which was forwarded to us by Mr. Henry Gray. The paper was a translation of a report read before the French Academy of Sciences, and gave an account of the results of the vaccinations against distemper during the year ending in the month of May, 1902. We have just received a similar report from Mr. Gray continuing the record of vaccinations by Dr. Phisalix from May 15, 1902, to July 11, 1903. The writer remarks that since May, 1902, the vaccinations were continued, and a larger number of dogs had been experimented on; but in the present report Dr. Phisalix only includes the results of his own inoculations in the course of his work at the museum, with the addition of the results which came to him from other sources, contributed by medical men and veterinary surgeons who were able to give the closest attention to the animals operated upon, and to know exactly what the effect produced upon them was. In this manner detailed particulars have been obtained relating to groups of from ten to ninety-five dogs vaccinated by the same operator. Some hundred dogs included in the statistics were tested at the same time as control dogs also were, either by contact with dogs presenting the characteristic symptoms of the disease, or by being kept in places in which dogs had died or were dying of the infection. The inoculated dogs stood the test satisfactorily, while the control dogs, meaning, of course, those which had not been protected by vaccination, took the disease. Dr. Phisalix remarks that he can present the following results as fulfilling all guarantees that can reasonably be desired of security and exactitude:

Of 985 dogs inoculated, 18 only contracted the disease, of which they died or for which were killed, showing a gross mortality of 1.70 per cent. The previous statistics showed a mortality of 2.88 per cent. Of the eighteen cases of death seven occurred from two to seven months after the vaccinal period, when the dogs ought to have been immune. They represent, therefore, the exact proportion of failures, amounting to 0.71 per cent. only. In the case of the eleven remaining dogs, two showed symptoms of distemper some days after the first inoculation, and the other nine were inoculated twice, and were attacked either after the first or a few days after the second inoculation. A dog which has reacted normally to one of the inoculations cannot be regarded as immunized till a fortnight after the second inoculation. It follows, therefore, that during the time comprised between the first inoculation and about the fourteenth day after the second inoculation, nearly the space of a month altogether, the dog, if not already in the incubative stage of infection, remains liable to contagion and natural infection, though the liability, it is true, grows less and less as the days run on. Mr. Gray designates this period as the negative phase of vaccination, and among the many hundred dogs which he has already vaccinated, either on his own account or for some of his colleagues, he has never had any deaths among the animals during this period of vaccinal reaction.

In order to form a correct estimate of the preventive efficacy of vaccination, it is necessary to make sure (1) that the dogs have never before been attacked by the disease, as a previous attack would confer upon them a certain immunity; (2) that the animals have not the germs of the disease within them (for this purpose the dogs should be kept under observation for a fortnight in a non-infested area before they are vaccinated); (3) that it is necessary to avoid during the vaccinal period exposing the dogs to direct or indirect contagion, or to damp, cold, over-exertion, or bad diet, all being causes which favor a natural infection. It is added in reference to 3 that in practice the latter precautions—i. e., prevention of exposure to damp, cold, over-exertion or bad diet—alone suffice, as the vaccine has only a favorable influence on the evolution of the disease when it has already openly shown itself or is incubating. It would seem, therefore, that it is not really necessary to keep the dog for a fortnight under observation, as vaccination will only have a favorable influence upon the result of contagion if the animal does become infected.

A number of observations are recorded both in the report itself and in tables of fatal cases of other diseases occurring after inoculation, such as double pneumonia, acute enteritis, gastro enteritis, intestinal lesions caused by foreign bodies, paralysis, epileptic fits, etc. It is not, of course, suggested that these accidental disorders were in any way connected with the inoculation. A certain number of dogs were vaccinated while they were suffering from attacks of different degrees of distemper. Of forty-four distempered dogs, thirty-six recovered. In one case particularly it is stated that a toy terrier affected with bronchial pneumonia was in a condition so serious as to be almost hopeless. The dog was, however, inoculated, and on the morrow the grave symptoms improved, and it recovered. Other serious cases are referred to by the author as affording evidence that the vaccine has a beneficent influence on the disease after it has declared itself, justifying the systematic use which certain veterinary surgeons make of the vaccine in the case of dogs already attacked. In conclusion, Dr. Phisalix refers to the advantage of a double inoculation, instead of a single one, admitting that sufficient protection could be obtained at once by the use of a single virus, but the risk of loss from such vaccination would be increased, and he prefers, therefore, the two inoculations of graduated virus, as the immunity conferred by this process achieves the object of protecting young dogs against contagion and natural infection without doing any injury to their health afterward.—Field (London).

Pointer Club.

NEW YORK.—*Editor Forest and Stream:* The members of the Pointer Club of America, also others who propose to make nominations in the Championship Stake, should impress upon their minds that entries to the Derby, All-Age and Championship Stakes will close on October 15. Members' Stake will close before starting. A cordial invitation is extended to all owners of broken pointers to enter in the Championship or Free-for-all Stake, and thereby assist in making our fourth annual reunion the red letter field trial of the club. Entry blanks will be mailed on application. The grounds at Holmdel, N. J., offer excellent advantages for the holding of a successful field trial, and as they have always been preserved there will be no scarcity of quail. Excellent hotel accommodation has been provided for all who may attend, and the outbuildings adjoining the hotel have been placed at the disposal of members for their dogs. The trials will commence on Monday, November 16. Week day trains will leave foot of Liberty street, New York, at 8:30 A. M., 3:53, 5:38, 6:30, 11:50 P. M. Sunday, 9:15 A. M. and 4 P. M. C. F. LEWIS, Secretary.

43 WALL STREET.

J. L. Kernochan.

JAMES L. KERNOCHAN, famous as a leading sportsman, died at The Meadows, his country place at Hempstead, L. I., on Monday of this week, aged 37 years. He was foremost as a dog fancier and as a horseman about New York. He maintained a large kennel, and a large stable of high class hunters. As a cross country rider he was eminent for his skill and fearlessness. He was a member of the Meadow Brook and Rockaway Hunt Clubs, the Westminster Kennel Club and the Knickerbocker Club, New York.

National Beagle Club.

At a recent meeting of the National Beagle Club of America Mr. Charles Quynn, of Frederick, Md., and Mr. Thomas Shallcross, of Providence, R. I., were appointed judges, to judge at the fourteenth annual field trials of this club, which will commence on Nov. 9, 1903, at Howardsville, Albemarle county, Va. CHAS. R. STEVENSON, Sec'y.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of *FOREST AND STREAM* offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18 ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

Canadian Indians Built First Canoes

DID you ever make an elder-pith popgun, a bass-wood windmill, or a man's face on a pine shingle? Then you are probably an angel. Almost every properly constituted boy has wood on the brain. Ask your school teacher. Every sane boy has at some time in his life hankers to whittle and drive nails. Wood fascinates him. The first thing he swaps a cap-pistol for is a jack knife. He is not so particular about the ax; and he rarely pines for the bucksaw—after the first stick. He is too busy whittling.

A farmer's boy any time not less than fifteen years ago could point you out about seventeen kinds of wood on his father's farm. He knew all by the bark, and most of them by the grain.

White oak had those horse hair long lines with the big saw teeth inside. Red oak was like it, but coarser and more brash. Elm was twisty. Soft maple was white in the flesh and wavy red in the heart. Hickory was similar, but tough, with long rosy splinters. Bass-wood was a feminine kind of thing, soft and white, with red pith. Hemlock was as soggy as packed clay. Birch was hard and full of dots. Turn him loose in a lumber yard at night and that boy could pick you out

half the kinds of timber by the touch and the heft; the rest by the smell. He had whittled most of them.

Some time or other he got hankering to make a boat. Perhaps he was a landlubber five miles from decent "crick." In that case, the old horse pond or the town line ditch at the dam would do to float the fabric to initiate him into that mystic craft—the aquatic association of humanity.

The oddest canoe ever seen on the Don was two scooped-out pine logs joined. That was the hermit Joe Taylor's, who himself lived in a dugout. But it was long before his time when the first real canoe was made of birch bark. We popularly credit Hiawatha the Ojibway, with the invention of that. For it was he who sang:

Give me of your bark, O birch tree!
I a light canoe will build me,
Build a swift Cheemaun for sailing.

And perhaps the boy never went to school since that epic got into the school books who did not feel a though he was some relation to Hiawatha, and the mythical Ojibway, the first man to think out a birch bark canoe. But bark canoes were made hundreds of years ago, as they are to-day, as far north of Hiawatha's country as Dakota is north of Mexico.

That is, the Arctic Circle; part of Canada not much celebrated for tourists. Most of it is moss on top of rocks. Most of the woods are on the shore of Great Bear Lake, where the electric light are all in the sky. It would have bothered Longfellow to write an epic about the heroes of that country. The midnight sun may be as poetic as a birch bark canoe, but they are unconscious of it. They don't build canoes for poetry, but to carry dried meat and skins, 1,500 miles to Fort Norman; also to spear caribou in—a very lively kind of regatta.

Wherever they roam in the summer in that queer big homeland they go in the bark canoes. The first thing the traveler notices in one of their caribou skin villages is a line of canoes by the bay. And the bark canoe they build to-day is probably the exact image of the one they built in the year 1 of that land.

A canoe often gets smashed on a caribou hunt or worn out on a cargo lug. The family that owns it must make another. They do it in that old-fashioned way known as a bee. The squaws fix up in their very best caribou skins, take their deerskin workbag—the muskamoots—with the deer bone needles and the threads of skin and the caribou sinews inside. They pick out a mossy rock with the water in front and the woods behind. There they squat, while the young girls lug out of the woods the rolls of birch bark cut by the men.

A canoe made on Lake Ontario may have several kinds of wood in it. The Great Bear Indians have the choice of but three; spruce, birch and willow. The willow is for coarse thread—about No. 2; just to bast with. The spruce makes the ribs, which are sewed on to the birch wale-streak. They never use nails. Nail cost about a dollar a pound in that country. But the bearbone needles are stout, and the squaws need no timbles.

The next item is to sew the bark rolls into a blanket for one canoe. This is just an Arctic Circle quilting bee, without the pie for dinner and the dance at night. Imagine the gossip; the little love stories told by those squaws; Jockwintee spearing fish yonder in the bay is going to marry podgy Wanella there, with her flat, smoky feet sticking over the rock. See her blus and simper as she gazes far out over the moss at the wobbling horns of a caribou buck nibbling at the moss hummocks. She pretends not to hear as she bites off her willow thread. But she already fancies that flat faced beau of hers paddling the new canoe that she helps to build.

The blanket is stitched. Into the bay it goes to soak while the girls gather spruce gum in the wood. By the time they are back, the old women have the soaked skin out and hung over the ribs. At it they go, sewing it on to the birch rim. Then they all sit in solemn silence on a rock to chew gum; not tut tut frutt, but wads of pitch.

And when that pensive job is done and the canoe dry in the hot sun, they solder the chewed pitch over the seams with a red hot fir stick. The canoe is done except for a few slats on the bottom. Eighteen feet long and more than four feet wide, the primitive craft weighs about fifty pounds; able to carry half a ton of dried meat and skins of musk ox; able to shoot after the swimming caribou in the spear time; the same yesterday, to-day and forever; the "swift Cheemaun" of the Arctic Circle red men who never heard of Hiawatha and never saw a hammer or a nail.

The white man has never improved much on the fashion of canoe building set by the red man. A canoe made at Sunnyside is stronger than a bark canoe, the expense of being about twice as heavy. The shell is quarter inch. The maker buys it in inch stuff. It makes a canoe out of boards. The first stage is the sawmill. An inch board a foot wide is ripped into six canoe boards, each six inches by a quarter inch. The band-saw does that; a chain of teeth running round pulley. It cuts on a curve without a kink. Boards are marked to a curve and trimmed to the mark; ready for the plane and the hammer down in the shop.

Meanwhile a plank lies on a bench marked off in six paddles. Oars are marked similarly, with no waste of wood. Sawed out to the mark, they are set to the whittling room, where the draw knife, the spok shave and the sandpaper make the blade ready for the oil and the varnish.

Suppose you want a canoe built, sixteen feet long with a thirty-eight inch beam. The first thing is the mold, which is nothing more than a huge shoemaker's last to fit the canoe you want. The mold goes upside down on two horses. In a groove at the top fits the oak keel, notched to go over the ribs. The ribs are a rock elm—tough as whalebone—to bow under the keel and catch by the ends in big swivel nails at the mold bottom.

Sixty ribs go into one canoe—if the barque you want is not a ribbed one but a smooth finish. The plan is busy at his bench; up to the ankles in paper wh shavings. That board he planes there is either bark

wood at \$45 a thousand, or cedar at over \$50. Cedar of the pure grain is hard to get. Basswood is easier; white as a hand in water; scarcely a knot. The planer runs a bead-awl along the edge. He is thinking about the joint, which, not being lapped like shingles, must still turn water.

That little pin scratch he makes is part of it. The rest of it is a long brass groove, as thin as paper and about as wide as four matches. One edge of this he fits into the scratch. The first board with the brass groove at the edge goes up to the keel. The nailer sticks it full of holes with an awl. A cobbler in wood, he stands over the big last, and jabs in the copper nails; a long, red row. Copper is rust-proof. And as there are about 3,000 nails in one canoe of that kind, rust is a good thing to keep out.

In a couple of hours the ribs are covered with a white sheet of basswood, dotted with countless nails and jointed with brass grooves. The bowsprit and stern knee are in, both walnut, and nailed fast. The gunwale goes on next—two slats of maple. That shell turns off the mold, ready for the benches, which are oak, butternut or cedar inlaid with walnut, according to your whim; ready also for the bow and stern caps, which may be varied in the same way.

And now if there is a knot that looks loose it gets a plug of cork. The whole shell gets a coat of linseed oil, which soaks into the grain. Then comes a smear of shellac which fills up the gaps left by the oil. The rest is three coats of varnish and a dry in the sun. The fancy woods are polished. The slats go in. A pair of spruce paddles is tied to one of the benches. Over the done canoe, which now weighs about eighty pounds, and may have been four days building, with its sixty ribs, its seven kinds of wood, and its 3,000 nails, goes a shroud of gunny sack.

That canoe is ready to ship; the red man's canoe over again with a difference; the lineal descendant of the "swift Cheemaun"; made in a shop and a factory, instead of a rock at the edge of the Arctic woods.—Brooklyn Eagle.

Red Dragon C. C.

WISSINOMING, DELAWARE RIVER,
Saturday, Sept. 12.

The annual fall races of the Red Dragon C. C. were held off the club house at Wissinoming, on the Delaware River, on Saturday, Sept. 12, with all conditions favorable to fast time—warm weather, very little wind and a flood tide. The races were open to all amateur canoeists and several members of the other Delaware River clubs competed. Canvas covered Indian model open paddlers were used in all the races except that for the club paddling trophy. A summary follows:

Event No. 1, standing paddling, ¼ mile, double-blade paddles: T. Rice Davis, Lakanoo B. C., first; J. C. McClister, R. D. C. C., second; P. S. McMichael, R. D. C. C., third; T. W. Cook, L. R. Lewis, M. D. Wilt and D. W. Anders also competed.

Event No. 2, tandem, single blades, ½ mile: T. R. Davis and John Conard, Lakanoo B. C., first; J. C. McClister and P. S. McMichael, R. D. C. C., second; M. D. Wilt and E. W. Crittenden, R. D. C. C., third; H. E. Davis and T. W. Cook, R. D. C. C., fourth; L. R. Lewis and D. W. Anders, Monte Cristo C. C., fifth.

Event No. 3, trophy paddling, ½ mile, double-blade paddles, and racing canoes: J. C. McClister, R. D. C. C., first; M. D. Wilt, R. D. C. C., second; L. R. Lewis, M. C. C. C., third.

Event, No. 4, one-man, single-blade paddling, ½ mile: J. C. McClister, R. D. C. C., first; T. W. Cook, R. D. C. C., second; E. W. Crittenden, Riverton Y. C., third; P. S. McMichael, R. D. C. C., did not finish.

Event No. 5, tilting: First bout—H. E. Davis, lancer, and E. D. Hemingway, paddler, won from E. W. Crittenden, lancer, and M. D. Wilt, paddler.

Second bout—L. R. Lewis, lancer, and T. W. Cook, paddler, won from P. S. McMichael, lancer, and J. C. McClister, paddler.

Final bout—L. R. Lewis, lancer, and T. W. Cook, paddler, won from H. E. Davis, lancer, and E. D. Hemingway, paddler.

Mr. J. E. Murray was the judge at finish, and Mr. H. W. Fleischman started the races.

Numerous out-of-town guests, including Mr. J. K. Hand, chairman of the A. C. A. Regatta Committee, and Mr. W. A. Furman, the new rear-commodore of the Atlantic Division, watched the closely contested races with interest. M. D. WILT.

A. C. A. Membership.

The following names have been proposed for membership to the A. C. A.:

Robert Bonner, S. Willard Brigham, Providence, R. I.; B. E. Phillips, Boston, Mass.

Northern Division.—R. Bloomfield, H. E. Miller, B. C. Rogers and H. H. Fullerton, all of Toronto.

Editor Forest and Stream:

I beg to inform you that the following have been transferred to the Life Membership list of the A. C. A.: June 29, John N. MacKendrick, Galt, Canada; July 28, E. B. Edwards, and A. J. Wright, Peterboro, Canada; Sept. 29, Edwin Gould, 29 Broadway, N. Y. C.

ROBERT J. WILKIN,

Pres. Board of Governors A. C. A.

Editor Forest and Stream:

The following have made application for associate membership to the A. C. A.: Mrs. Nathaniel S. Hyatt, Mrs. C. M. Greswell and Mrs. Frederick W. Donnelly. EDWARD MULLER, Purser.

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 24, 1903. C. F. WOLTERS, Commodore-Elect.

JOHN S. WRIGHT, Sec'y-Treas.

LEDA, Ex EFFORT.

Yachting.

Yachting Fixtures for 1903.

Members of race committee will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

OCTOBER.

10. Columbia, special, Lake Michigan.
17. Columbia, special, Lake Michigan.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
Second prize, \$50.00.
Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

Old Mill Y. C.

JAMAICA BAY, LONG ISLAND,
Saturday, September 27.

The Old Mill Y. C. held its final race of this season

on Saturday, September 27. The boats raced for prizes offered by the flag officers of the club. There were sixteen starters and the contests in the several classes were exciting, a fresh S. W. breeze holding throughout the contest.

The start and finish was from off the bulkhead at the entrance to Spring Creek, and the course sailed by cabin and open cats was from the starting line to a stakeboat off Howards landing, then to red buoy No. 4 in main channel, then to starting line. The course for sharpies and launches was from the starting line to a stakeboat near the Canarsie breakwater; thence to a stakeboat off Howards, thence to the starting line, and sailed over twice.

The preparatory signal was given at 1:30, and the launches were sent away five minutes later. The summary follows:

Launches—Start, 1:35.		Elapsed.	Corrected.
	Finish.		
Amaranth	2 10 37	0 35 37	...
Lottie M.	2 10 40	0 35 40	...
Osceola	2 11 25	0 36 35	...
White Seal	Did not finish.		
Eagle	2 12 40	0 37 30	...
Cabin Catboats—Start, 1:40.			
Diana	3 34 38	1 54 38	1 54 20
Helen	3 42 30	2 02 10	2 02 10
Open Catboats—Start, 1:45.			
Pauline B.	3 31 30	1 36 30	1 36 30
Halcyon	Did not finish.		
Bill Nye	3 30 45	1 35 45	1 25 15
Sharpies—Start, 1:50.			
Alert	3 20 20	1 30 30	1 30 30
Free	Disabled.		
Lester	3 23 28	1 33 28	1 32 28
Clyde	3 21 33	1 31 33	1 31 28
Charlie D.	3 24 36	1 34 36	1 34 66
Wild Duck	3 23 41	1 33 41	1 31 41

The winners were Lottie M., Diana, Bill Nye and Alert.

National Motor Boat Exposition.

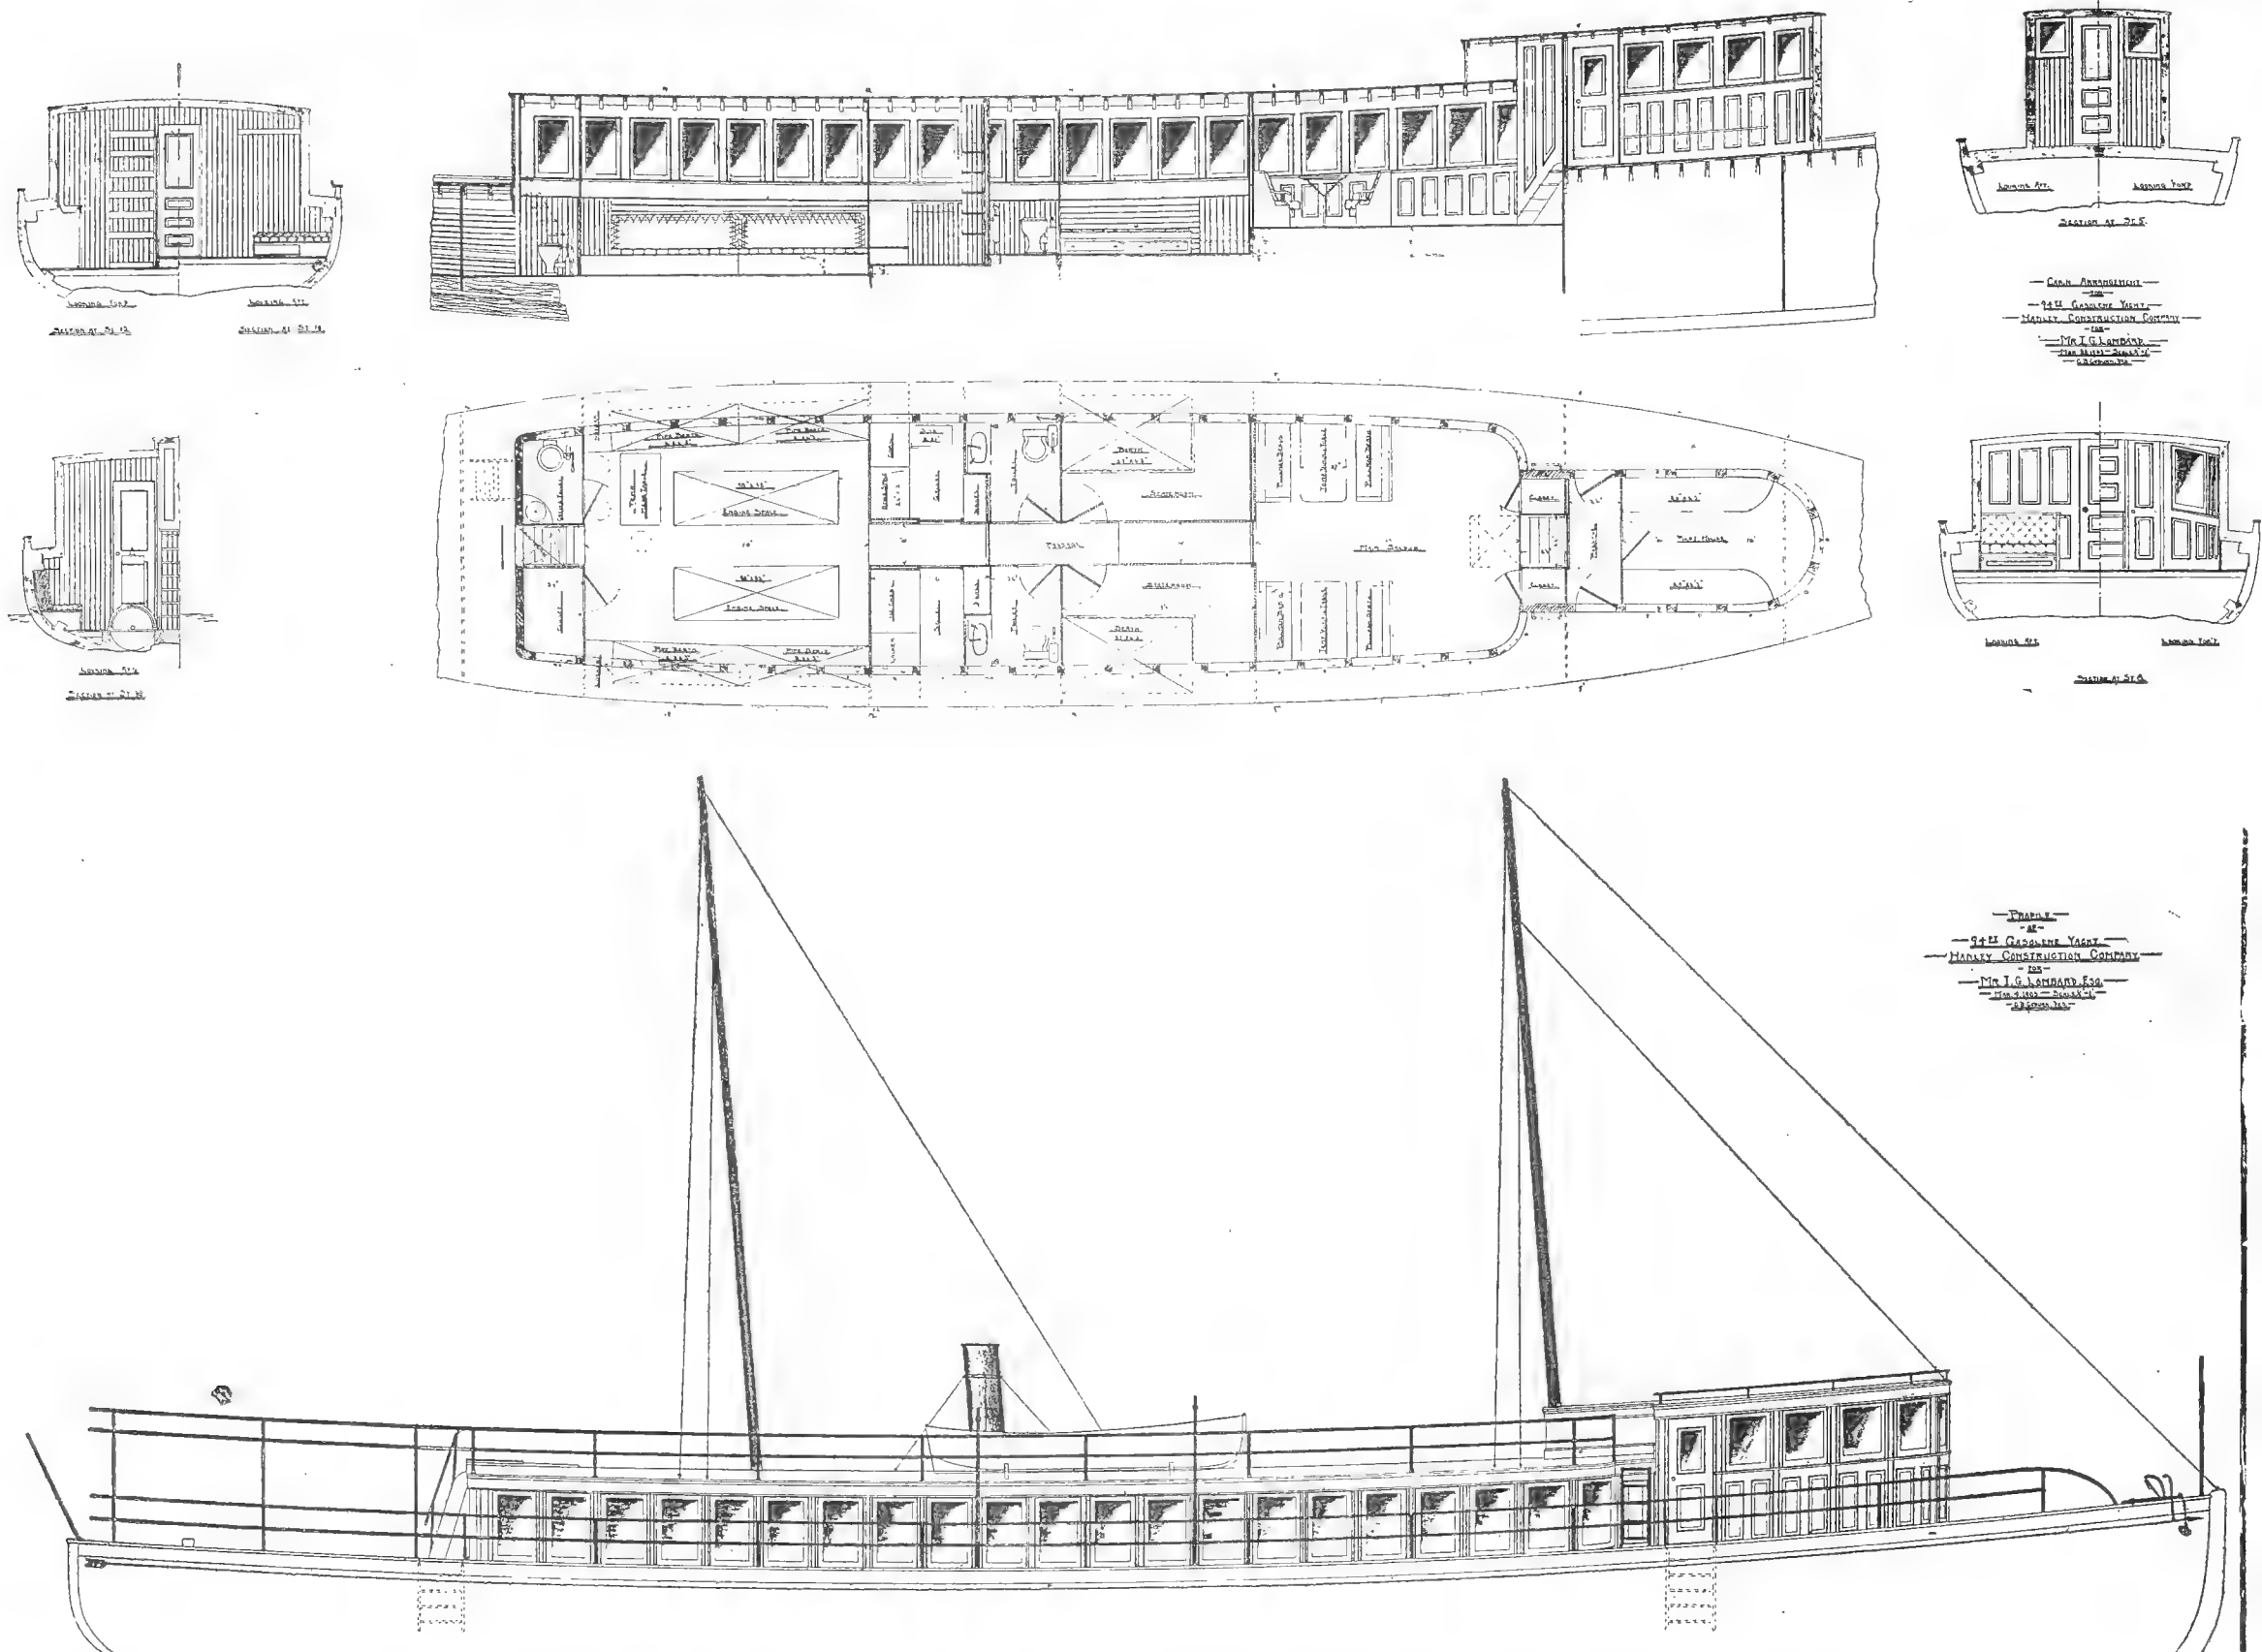

THE first exposition designed to recognize motor boats as a maritime quantity to be reckoned with, will be a unique exhibition event in the winter of 1904 in New York City. The National Motor Boat Exposition will be held February 8 to 20 at the new and spacious Herald Square Exhibition Hall at the junction of Broadway, Thirty-fourth street and Sixth avenue.

The preliminary prospectus sent out by the management of the Motor Boat Show brought quick responses expressing the interest of makers of motor boats, motors and auxiliaries, and the prospect is bright not only for a first show of motor boats, but for its annual repetition.

One application has been received by an inventor of an air ship whose craft will be ready, he announced, and can be navigated about the hall. Among the oddities which have been suggested as an exhibit is a motor canoe, invented and built in Newport, on the lines of the famous flying proa. The Newport canoe's main hull is but 2½ ft. beam, and she has made 13.43 miles an hour.

The motor boat is both the rich man's and the poor man's craft, as the steam yachtsman wants his launch for a tender, while with the poor man the launch is "the whole thing." At the National Motor Boat Exposition those interested may see all kinds, and each may take his choice.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

THE GASOLENE YACHT NAUHAUGHT—OUTBOARD PROFILE, CABIN AND SECTIONAL PLANS—Owned by I. G. Lombard, and built by the Hanley Construction Co., 1903.

SPASM, Ex COUNTESS.

Owned by J. Berre King. Designed and built by the Herreshoff Mfg. Co., 1900.
Photo by N. L. Stebbins, Boston.

The Gasolene Yacht Nauhaught.

We publish herewith the plans of the twin-screw gasolene yacht Nauhaught that was built last winter by the Hanley Construction Company of Quincy, Mass., for Mr. I. G. Lombard, of Chicago, Ill. The boat was designed by Mr. C. B. Coburn. She has been used constantly during the past summer, and has given entire satisfaction, having proven to be fast, able and comfortable. Her dimensions are as follows:

Length—	
Over all	94ft.
Waterline	91ft. 3in.
Overhang—	
Forward	1ft. 1in.
Aft	1ft. 8in.
Freeboard—	
Forward	7ft.
Least	3ft. 9in.
Aft	5ft.
Breadth—	
Extreme	16ft.
Draft—	
Extreme	4ft.

It was the owner's idea to secure a serviceable and strongly built boat, and the builders turned out a most superior vessel. The Hanley Construction Company, with their improved and enlarged plant, are prepared to do the finest grade of work.

Nauhaught is roomy below and beautifully fitted. The house is finished in mahogany; pilot house and main cabin are large and comfortable, also finished throughout in mahogany; in the pilot house there is room to sleep two persons; her main cabin has two berths of the Pullman type; there are two large staterooms, two toilets, a double galley and large engine room with complete accommodation for the crew of four, which consists of captain, engineer, cook and deckhand; these are all finished in cypress with mahogany trim. There are accommodations for sixteen persons, all told, on board. Arrangements are made for a promenade deck on the top of the house.

She is equipped with two 50 horse-power gasolene engines which give her a speed of fourteen knots. The boat is lighted by electricity throughout with a storage battery equipment from the Electric Storage Battery Company.

The steam yacht Wachusett has been sold by Mr. W. A. Jamison to Mr. Sauto Oteri, a resident of New Orleans, and a member of the Southern Y. C. Wachusett is 92.4ft. over all, 86ft. waterline, 15ft. breadth and 6.5ft. draft. The yacht has been refitted and equipped with turbine engines, and it is expected she will develop a speed of fourteen knots. Wachusett cleared from New York a few days ago for New Orleans.

Y. R. A. of Massachusetts.

Proposed New Classes.

THE regular fall meeting of the Yacht Racing Association of Massachusetts will be held at Young's Hotel on Thursday evening, October 15, when the Executive Committee will report on proposed new classes, the restrictions for which have been drawn up by Mr. Louis M. Clark, Hon. Charles Francis Adams, 2d, and Mr. Sumner H. Foster, respectively. Since the discovery that the present rules would admit of yachts of extreme types, generally calculated to be of more harm than good to the sport, it has been the endeavor to get up some restrictions governing individual classes, or rating rules governing all classes, which would produce better boats. Weaknesses in the present rules have been considered, and the results of rules in other sections have been carefully watched. The result is that three new classes will be proposed. Two of these are to be governed by rules similar in nature to those governing the present restricted classes and another is an experiment in rating rules. The restrictions governing the three proposed classes are as follows:

Thirty-Foot Rating Class.

Rating, not to exceed 30ft., equal 80 per cent. of L multiplied by the square root of the sail area and divided by the cube root of displacement.

L is length measured 9in. above the load waterline plane, on a line parallel with the middle fore and aft vertical plane and at a distance from it equal to one-sixth of the greatest beam at the load water line. If this length is shortened by any notches, hollows, jogs, angles or reverse curves, the measurements shall be taken to the straight lines bridging said notches, hollows, jogs, angles or reverse curves. To this length are to be added any penalties hereinafter provided.

S is the sail area in square feet measured according to the rule of 1903 for measuring sails in class D.

D is displacement in pounds. Boat to be measured and weighed in racing trim, without crew.

L. In case length taken as above exceeds 32ft., such excess shall be added to said actual length to obtain L. In case length is less than 25ft., it shall be taken as 25ft.

The maximum beam shall not exceed 13ft. The minimum load waterline beam shall be not less than 9ft.

One-half of any excess of draft over 6ft. 9in. shall be added to the actual length, taken as above, to obtain L.

The sail area shall not exceed 1,400ft.²

All spars shall be solid.

The least freeboard shall be 30in. on 9ft. of load waterline beam, with a deduction at the rate of 1in. for each additional foot of load waterline beam.

There shall be not less than 5ft. 10in. clear headroom above the cabin floor over an area of at least 20 square feet.

The number of the crew shall not exceed five.

The cockpit shall be above the load waterline with scuppers draining outboard.

There shall be a substantial partition at the after end of the cabin.

Two berths not less than 6ft. 6in. long and 21in. wide, in the cabin.

One gas pipe berth in the forecabin, not less than 6ft. long and 18in. wide.

Two clothes lockers, sideboard and linen locker and a toilet room and water-closet properly connected and draining outboard.

All of these fixtures shall be built of stock not less than 1in.

capacity, with proper connection to deck, swash plates, cleaning out aperture and vent.

Ice chest lined with zinc and built into the boat, with proper air space, and capable of holding not less than 100 pounds of ice, besides compartment for provisions.

Also cushions, bedding, stove, dishes, cooking utensils, life preserver, compass, riding lamp, fog horn, all suitable for cruising purposes, must be on board.

Scantlings to be published later.

LOUIS M. CLARK, Committee.

Twenty-One Foot Class.

A boat of this class is intended to be a seaworthy boat, of fair accommodations, rigged with only mainsail, jib and spinnaker, fitted with solid spars and having only one rudder or centerboard.

The length of the load waterline with full equipment shall not exceed 21ft. Permanent distinguishing marks shall be placed on the bow and stern.

The length, measured on a line parallel with and 6¼in. above the load waterline, and parallel with the middle fore and aft vertical plane, and at a distance therefrom equal to one-sixth of the maximum beam at the load water plane, shall not exceed 2½ft.

If the lengths, taken as above, are shortened by any notches, hollows, jogs, angles or reverse curves, the measurements shall be taken to the straight lines bridging said notches, hollows, jogs, angles or reverse curves.

The beam at load waterline in keel boats shall be at least 7ft., and in centerboard boats at least 8ft. 3in., and shall not exceed 10ft. 3in.

The freeboard shall be not less than 20in.

The Draft—For centerboard boats the draft shall be not less than 3ft. for at least 5ft. length of keel for boats of 8ft. 3in. beam, with a reduction of 1in. in draft for 2in. of additional beam up to 10ft. 3in.

Keel boats shall weigh when rigged and equipped in accordance with these rules not less than 6,000 pounds, centerboard boats not less than 5,400 pounds. It shall be the duty of the measurer to see that nothing is on board when the boat is weighed except what these rules prescribe, and that the boat is in every way in her normal condition.

The keel, deadwood, stem, frames, floors, house and deck beams shall be of oak and solid.

Stem—Three inches sided at head—the minimum siding measured at the rabbet at stem head—siding increased to meet width of keel.

Keel—To run from end of load waterline to transom at stern. Minimum thickness (depth) 3¼in. The minimum of sectional area (48in.), including keelson and deadwood (breadth multiplied by depth in the middle of keel), may be made up, if desired, by a deeper keel. The breadth of keel may taper from greatest section to 4in. at bow and stern.

The minimum sectional area of frames and deck beams shall be 2 square inches; of house beams 1 square inch. Frames and beams shall be spaced not more than 9in. center to center.

MARGUERITE.
25-foot waterline sloop. Designed and built by the Geo. F. Lawley & Son Corp. for John F. Dingee.
Photo by N. L. Stebbins, Boston.

There shall be at least six floors 5in. in sectional area in way of the keel, and two at mast step, with floors of half this area at all intervening frames.

Planking, including deck and the side of the house, shall be not less than seven-eighths of an inch thick; the top of house shall be not less than five-eighths of an inch finished, or one-half inch if covered with canvas.

Deck clamps and bilge stringers of yellow pine shall run from stem to stern, with a minimum cross-section 4 square inches for at least the load waterline length.

There shall be a deckhouse with sides, at least 9in. high over a space 3ft. wide and 7ft. long.

Cabin shall have two transoms 6ft. 6in. long and two lockers.

The actual sail area shall be not over 550 square feet, and not more than 440 square feet of actual sail area shall be in the mainsail. The measurer shall be provided with a correct sail plan of the boat and shall cause distinguishing marks to be placed on the spars as follows: On the mast at the tack and at the throat of the mainsail, on the boom at the clew of the mainsail, on the gaff at the peak of the mainsail. No part of the mainsail shall be allowed to extend beyond these marks. The marks shall be black bands painted around the spars. The inner edge of the bands shall be the limits of the sail. The actual area of the jib shall be measured.

The extreme distance in feet from mast to end of spinnaker boom when in position as used shall be not more than 360 divided by the distance in feet from deck to spinnaker halyard block.

No battens over 2ft. in length allowed.

The forestay shall remain fixed at both ends during a race.

Equipment to include anchor not less than 35 pounds and a cable of not less than 30 fathoms of 1 1/4 in. rope, also bucket, pump, compass, fog horn, lantern and three life preservers.

The crew is limited to three persons, including the helmsman (who must be an amateur).

C. F. ADAMS, 2d,
Committee.

Fifteen-Footers.

The length of the load waterline, with full equipment aboard, but without crew, shall not exceed 15ft.

The over all length shall not exceed 25ft. The forward or after overhang shall not exceed 6ft.

The beam at the load waterline shall be at least 6ft. 6in. for keel boats and 7ft. for centerboard boats.

A square-ended, snub-nose, or square-sided bow not allowed. The beam at a point half way between the waterline forward and the extreme bow shall not exceed 45 per cent. of the greatest waterline beam. The underbody of the hull at said point, measured from rail to rail, shall not exceed the number of inches represented by the sum of the beam plus the depth of hull plus 3 measured at the same point. The freeboard at said point shall not be less than 22in.

Any evasion of the spirit as well as the letter of this rule shall disqualify a boat for this class.

The freeboard shall not be less than 15in.

All boats shall weigh, when rigged and equipped in accordance with these rules, exclusive of inside ballast, not less than 2,400 pounds for keel boats, and not less than 2,100 pounds for centerboard boats. The measurer shall see that nothing is on board when the boat is weighed, except what these rules prescribe, and that the boat is in every way in her normal condition.

The outside ballast shall be not less than 500 pounds, exclusive of any ballast on the centerboard, for centerboard boats, and not less than 700 pounds for keel boats.

The cockpit floor shall be above the l. w. l. with scuppers draining outboard, or the boat shall be provided with water-tight bulkheads satisfactory to the measurer.

There shall be on board anchor weighing not less than 25 pounds and 30 fathoms of suitable cables, two life-preservers, compass, riding light, fog horn and roft. oar.

The crew shall be not more than three persons.

The sail area shall not exceed 375 square feet. The actual area of the mainsail and jib shall be measured. The number of square feet in each shall be stamped on each sail by the measurer in full, round, black figures not less than 3in. high. This number shall be known as the official number of the sail, and shall always be visible. Any yacht using a sail not bearing the official number shall be disqualified.

The measurer shall be provided with the correct sail plan of any boat to be measured, and shall cause distinguishing marks to be placed on the spars as follows: On the masts at the tack and at the throat of the mainsail, on the boom at the clew of the mainsail. There shall be only one mark at each point. These marks shall be black bands, not less than 1in. wide, painted around the spar, which shall be the official marks. The inner edges of the bands shall mark the limits to which the sails may stretch without exceeding the sail area allowed. No part of any sail shall extend beyond these marks, and the marks shall always be kept visible.

The distance from the center of the mast to the outer end of the spinnaker boom, when the later is at a right angle to the fore and after center line of the yacht, shall not exceed 10ft. The spinnaker halyard block shall be placed not more than 25ft. above the deck.

In no case shall the area of the mainsail exceed 80 per cent. of the entire area allowed.

The spinnaker shall be triangular and shall not extend above the spinnaker halyard block, or beyond the end of the spinnaker boom.

All sails shall be made of cotton. Battens shall be limited to 2ft. in length. Hollow spars not allowed. Metal or hollow fins, deadwoods, centerboards or rudders not allowed. No boat allowed more than one centerboard and one rudder. Leeboards not allowed. Boats having a draft of more than 2ft. 6in. without centerboard shall be considered keel boats.

Planking—White cedar, white pine or spruce, not less than 3/4 in. in thickness after final planing. Double planking not allowed.

Frames—Oak, not less than 1 1/2 in., spaced 8in. on center.

Shelf or clamp—Hard pine, not less than 3 square inches sectional area to extend the whole length of boat, one on each side.

Bilge stringers—Hard pine. There shall be one bilge stringer on each side, running the whole length of boat, with a sectional area of not less than 3 square inches.

Deck—White pine or spruce, not less than 5/8 in. in thickness, or not less than 1/2 in. in thickness if canvas covered.

Deck beams—Oak, not less than 1 square inch sectional area, and spaced 8in. on center.

SUMNER H. FOSTER,
Committee.

Beverly Y. C.

DELAWARE RIVER, NEW JERSEY,

Friday, September 26.

The postponed Labor Day regatta of the Beverly Y. C. was sailed on Friday, September 26. Boats belonging to the Riverton Y. C. participated in the event, and there were sixteen starters. The wind was fresh from the S. W., which gave the boats a close reach down the river to the buoy off Fox Island, and a broad reach back to the finish line.

In the catboat class Tiona led all over the course, and finished a winner. Sea Gull was second. Dorathea beat Watmus in the special race in the jib and mainsail class. A. G. Cook took first prize in the Mosquito fleet class, and Cortright won out in the Lark class. The summary:

Catboats—Start, 3:25.		Finish.
Fiona, J. Perkins	4 34 50	
Sea Gull, S. C. Cook	4 35 53	
Carolyn II., C. C. Rianhard	4 37 30	
Titania, J. Hainer	4 39 24	
Peerless, H. Craythorne	4 41 15	
Priscilla, S. Bonfield	4 43 27	
Gertrude, G. W. Holloway	4 47 07	
Jib and Mainsail Fleet—Start, 3:30.		
Dorothea, S. Solomon	4 37 45	
Watmus, B. Morgan	4 55 37	
Mosquito Fleet—Start, 3:30.		
No. 11, A. G. Cook	4 58 53	
No. 14, Walnut Boys	5 02 10	
No. 10, Harry Cooke	5 06 05	
No. 2, Robert Biddle, 2d	Withdraw.	
Larks—Start, 3:35.		
No. 1, Cortright	4 56 37	
No. 2, Petit	5 05 02	
No. 3, Taylor	5 08 00	
No. 4, Wilson	5 10 03	

In the series of races the catboats have won points as follows: Butterfly, 17; Fiona, 10; Peerless, 8. The points secured by the larks in the series were: No. 3, Theodore Bonfield, 8; No. 4, E. K. Cortright, 8; No. 2, H. A. Taylor, 4; No. 5, Woodnut Pettit, 3.

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND,

Saturday, October 3.

Three of the one-design 15-footers sailed a race on Saturday, October 3, over inside course No. 3. The breeze was fresh from the E. Cayenne won the race by over 3m. Sabrina was second. The summary:

15ft. One-Design Class—Start, 3:30.		Finish.	Elapsed.
Cayenne, Colgate Hoyt	6 06 30	2 36 30	
Sabrina, C. W. Wetmore	6 09 31	2 39 31	
Marjorie, Percy K. Hudson	6 20 47	2 50 47	

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

Messrs. Macconnell Bros. have sold the 60ft. gasoline yacht Augusta for W. McMaster Mills, N. Y. Y. C., to ex-Governor Geo. W. Baxter, of Colorado; the schooner yacht Adrienne for Col. David E. Austen to H. Ashton Little, of Philadelphia; the auxiliary yawl Marajah to Edward M. Mulford, of New York, and chartered the steam yacht Buccaneer to Hon. Elmer P. Howe, of Boston, for two months, chartered the steam yacht Aida for Hon. Edw. Swann to Mr. C. A. Andrews, of New York; chartered the 74ft. gasoline yacht Pharamond for W. A. Rainey, of Cleveland, to Clarence A. Caldwell; the sloop yacht Narika for C. H. Eagle to John M. Ellis, of Hartford, and the steam yacht Halcyon for Gas Engine & Power Co. to D. S. Harding, of Chicago.

Mr. Hollis Burgess has made the following sales: 30ft. yawl Katharine, owned by Mr. W. Starling Burgess, of Boston, to Mr. Richard Henry Warren, of New York; 23ft. catboat Romp, owned by Mr. Richard Henry Warren, to Mr. W. Starling Burgess, and a new 20ft. sloop to Messrs. F. F. Harvey and John A. Sherlock, of Boston.

No class of small boats has ever given greater satisfaction in Massachusetts waters than the 18-footers. This class was established three years ago and has been growing in popularity and strength ever since. The first of these boats to make an appearance on the Sound was Trouble, which boat was purchased by Mr. Childs last year. She proved to be very desirable for racing on the Sound and on Gravesend Bay, and did well in the regattas in which she was entered. The Bridgeport Y. C., wishing to start a new class for club and circuit racing, decided that the Boston 18-footers were about the size of boat they wanted. Mr. B. B. Crowninshield has sold the following 18-footers, and all the new owners are Bridgeport yachtsmen: Mirage, owned by J. W. Olmstead, to J. P. Bartram; Question, owned by J. Henry Hunt, to N. W. Bishop; Miss Modesty, owned by B. S. Permar, to De Ver H. Warner, and Alanada, owned by A. T. Malcolmson, of Providence, to L. F. Warner.

These boats mark the beginning of the class, which will, no doubt, prove a factor in the Sound racing. It is expected that fully ten or twelve of the 18-footers

will be owned by Bridgeport men by the time next season's racing begins.

Messrs. Burgess & Packard have gotten up plans for a one-design class of catboats that will be raced at Pensacola, Fla. The boats are 16ft. over all, 13ft. waterline and will carry 190 sq. ft. of sail.

The Babylon Y. C., of Babylon, Suffolk county, L. I., was incorporated at Albany last week. The directors: Joseph J. Chew, John S. Foster, William May, James Magee, J. Schenck, S. Remsen, William P. Reid, Egbert V. Strong, John Snedecor, Charles Searle, Benjamin B. Wood, Babylon; August C. Smith, West Islip; James C. Bergen, New York City.

Mr. M. Samuels, who recently purchased Shamrock I., has decided to break her up for the old metal she contains.

Mr. Charles A. Dean is having a twin screw steam yacht built at Morris Heights. The yacht will be completed about Nov. 1, and as soon as she is turned over to her owner she will proceed to Florida, where she will be used during the winter. She is 80ft. over all, 77ft. waterline, 18ft. breadth and 3ft. draft. Forward there is a deck house, and extending aft is a low house over the engine room and owner's quarters, which consist of a large saloon, four staterooms and a bath room. The forward house is used as the dining saloon. The galley and the crew's and officers' quarters are below decks, forward. The yacht will be steered from a bridge, which is just aft of the forward deck house. Three boats are carried on the davits. She will have a speed of ten miles.

Henry Steers was drowned off his country place at Westport, Mass., on Tuesday, Sept. 29. Mr. Steers, together with his skipper, started out in a boat to do some fishing. It was blowing hard at the time, and there was quite a sea running. The boat reached the fishing ground off Stony Point safely, but the increasing wind blew her into the breakers and she capsized. Employes on the Steers place saw the accident, and went immediately to the rescue. Captain Hammond was brought ashore and revived after hard work, but Mr. Steers was too far gone to be resuscitated. Henry Steers comes from a family that have been famous in the yachting world for the past sixty years. His uncle, George Steers, designed and built the famous schooner America, and Henry Steers crossed the Atlantic in her and sailed in the races when she won the America's Cup. At this time he was a lad of thirteen. Mr. Steers succeeded to his uncle's shipbuilding business, and he conducted it successfully for years. He built the schooner Henrietta, which won the first race across the Atlantic in 1866. Mr. Steers was in perfect physical condition, notwithstanding his age, and he took an active interest in yachting. His sad death removes a prominent figure from yachting circles. He was a member of the New York Yacht, Union, Racquet and Engineers' clubs. He is survived by a widow and two sons.

After figuring the corrected time in the 25ft. class, the Regatta Committee of the Riverside Y. C. find that Firefly beat Robin Hood by the narrow margin of 4s. in the race sailed on Saturday, Sept. 26.

Horace Cox, the London publisher, has gotten out the third edition of R. T. McMullen's "Down Channel." The book contains 364 pages and is well illustrated by numerous charts, plans and pictures. The binding is a substantial one of blue cloth and the low price asked for the book puts it in the reach of every one.

Rifle Range and Gallery.

Old Guard's Military Fair.

THE Old Guard's military fair opened on Monday evening of this week, at Madison Square Garden.

The feature of the opening was the presentation of the Palma trophy to the American rifle team, the members of which were present. They were in command of Col. Leslie C. Bruce, who also was in command of them while they were abroad. Gen. Bird W. Spencer, the president of the National Rifle Association, made a brief and pertinent speech, after which he introduced Gen. Geo. W. Wingate, referring to him as the Father of Long Range Rifle Shooting in America. General Wingate's presentation speech was vigorously applauded. Former Supreme Court Justice Henry A. Gildersleeve made a strong speech, reviewing the history of the trophy, touching specially on the differences of arms and ammunition, their excellence and the excellence of skill displayed. He also was enthusiastically applauded.

The rifle and revolver competitions were well patronized in the basement. The ubiquitous Lieut. Thomas H. Keller, in uniform, was actively in evidence everywhere, assisting in promoting the success of every detail. He was the busiest worker in the Garden. He is a member of the Range Committee, the Prize Committee, and the Programme Committee, and the Executive Committee. In prizes and cash \$1,000 are offered to successful contestants.

The rifle matches are: A Continuous match; a Souvenir point target match; a Ladies' Souvenir match; Fifty-shot Individual Interscholastic match, and a sub-target re-entry match.

The revolver matches are Match A, any revolver continuous match; Match B, rapid-fire match, any revolver.

Our Own Rifle Club.

Hoboken, N. J., Oct. 3.—The weekly shoot of Our Own Rifle Club was held Sept. 29, at 136 Springfield avenue. Mr. J. Ostermeier won the medal. Preparations for the Thanksgiving target excursion have been commenced. The scores:

Bauder's Team—J. Bauder 240, L. Bittel 226, J. Humphries 214, J. Ostermeier 224, F. Mertz 218, Coley 210, McGoldrick 214, Gerluerson 187; total 1733.

Gabriel's Team—Gabriel 234, F. Besson 230, H. Larson 223, Knecht 215, W. Hertler 197, C. Kull 200, A. Greenfield 195, Tyldesley 203; total 1697.

Excellent Shooting.

The accompanying diagrams show the actual shooting done with the new Peters .30-40 U. S. Government smokeless ammunition in the recent Sea Girt meeting. Diagram No. 1 shows the shooting of this ammunition in the New Jersey trophy match at 500 and 600yds. There are 10 shots, of which are bullseyes; 1 to 5 were fired at 500yds.; 6 to 10 600yds. Diagram No. 2 was shot in the Gen. E. P. Meany match. All shots but one were bullseyes; 1 to 7 inclusive were fired at 500yds.; 8 to 14 at 600yds.

1904.
Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

Mr. J. S. Wright announces that the Brooklyn Gun Club, of which he is the manager, will hold a prize shoot on Oct. 12.

Mr. C. M. Meyer, one of the best shots of the New York Athletic Club, starts on a Southern cruise in his yacht in the near future.

In a contest at 100 targets, Mr. Howard George, of Philadelphia, defeated Mr. Anthony Felix, on the grounds of the Delaware County Country Club, Oct. 3, by a score of 83 to 79.

At the annual live-bird shoot of the Hilltop Gun Club, near Austerlitz, Ky., Mr. C. W. Phellis killed 50 birds straight in the main event. His nearest opponents were Mr. R. O. Heikes, of Dayton, O., 48; Fred Gilbert, of Spirit Lake, Ia., 47, and H. C. Hirschy, of Minneapolis, 44.

The return match between Harrisburg and Lykens, Pa., teams was shot at Harrisburg, on Oct. 3. There were thirty men on a side, 25 targets per man. The scores were: Harrisburg 559; Lykens, 414.

At the shoot of the Meadow Springs Gun Club, Philadelphia, Pa., Oct. 3, a five-man team match was shot, 25 targets per man. The winning team, whose members were G. Smith, Hansel, Pepper, Street and Wright, scored 90, while the losing team—Sharp, J. Smith, Alexander, Martin and Short—scored 76.

The secretary, Mr. J. Breidenbend, informs us that "the eighth annual target tournament of the Mt. Sterling Gun Club will be held Oct. 20. The programme will consist of four ten, eight 15 and two 20-target events; \$1, \$1.50 and \$2 entrance respectively. No one will be barred; everybody is welcome."

Mr. Harry J. Lyons, of Louisville, tied with Messrs. J. T. Page, Elkton, Ky.; Alfred Clay, Austerlitz, Ky., and Jake D. Gay, of Pine Grove, Ky., on 25 straight, in the Kentucky championship contest. There were nineteen contestants. In the shoot-off at 10 birds, Messrs. Lyons and Clay killed straight.

The Fulton Gun Club, of Brooklyn, L. I., desires that shooters keep their opening event in mind. The date is Oct. 11. Shooting commences at 11 o'clock A. M., and there are prize events and sweepstakes. Take car to Crescent street, Kings County "L," Brooklyn. The grounds are situated on the Old Mill road.

The opening shoot of the New York Athletic Club's fall season took place at Travers Island on Oct. 3. The main event of the shoot was a handicap at 100 targets, which was won by Mr. H. Walker, with a full score of 100. Mr. C. M. Meyer was second with 98; Mr. Gus Greiff, shooting from scratch, broke 87.

The Lehigh Rod and Gun Club, of Bethlehem, and the Easton Rod and Gun Club, of Easton, Pa., shot a ten-man team return contest at Easton, on Oct. 3. The scores were: Lehigh 196, independent 195. Mr. J. Maurer, of the Easton team, made the high score of the event, 25 straight. Mr. D. S. Daudt was high man on the Bethlehem team, 24.

Mr. W. M. Thomas, the popular ballistic expert of the U. M. C. Co., witnessed the presentation of the Palma trophy to the American rifle team in Madison Square Garden on Monday evening, this event being a feature of the Old Guard Fair. He was specially interested, having been in England with the team when it was engaged in its memorable contest.

Mr. G. G. Williamson, of Muncie, Ind., famous as a skillful trapshooter, a successful field trial contestant and a most companionable gentleman, was a visitor in New York on Saturday last week. He had been enjoying some field shooting in New Hampshire, besides making some friendly visits in the East.

At Lexington, Ky., Sept. 25 and 26, in the professional class, on the second day at targets, Mr. Wm. H. Heer was highest average, with 190 out of 200. Mr. Fred Gilbert was second, with 187; Mr. C. F. Dreih was third, with 176; Mr. T. Marshall was 174; Mr. H. C. Hirschy was 164; Mr. H. Waters was 169; Col. J. T. Anthony was 165.

The fall shooting season of the Crescent Athletic Club began on Oct. 3, on their beautiful grounds at Bay Ridge. Mr. L. M. Palmer, Jr., presented two valuable cups for class shooting contests. The chairman of the shooting committee presented a trophy for handicap contests, and Mr. Chas. Sykes presented a cup for team competition. The club will hold its regular shoots for the monthly cups, the three best scores of each contestant each month to count. Also the club will offer a cup for the highest scratch average made during the season, and one for the highest handicap average. Mr. T. W. Stake has donated a cup to be known as the Holiday cup, to be contested for on the six legal holidays of the season. The allowance system of handicapping will be retained.

The preliminary programme of the first grand tournament of the National Gun Club, of Indianapolis, Ind., Oct. 26-31, will have \$500 added, donated by the French Lick Hotel Co. Of this, \$10 is applied to each of the thirty target events, and each event is at 20 targets. Also to each of the five 20-sparrow events, \$10. A silver loving cup to the winner in the 100-target contest, which consists of the tenth event on the first day, and the ninth and tenth events on the second and third days respectively; entrance optional, \$10. To the five high guns shooting through the three days, \$15, \$12, \$10, \$8 and \$5. To each of the five sparrow events \$10 will be added. The five 20-sparrow events will constitute a champion sparrow race, entrance, optional, \$10; high guns; a silver loving cup will be the reward of the winner. Except in five events, which are high guns, the moneys will be governed by the Rose system, 7, 5, 3 and 2. The entries in each of the five 20-sparrow events is \$6. There is also something hinted concerning pigeon shooting and taking pigeon loads accordingly. The complete programme will be issued in the near future. All guns and shells should be shipped, by express, prepaid, and marked "Mr. T. Taggart, French Lick Springs Hotel Co., French Lick, Ind." All requests for programmes, information or rooms should be addressed to National Gun Club, P. O. Box 463, Indianapolis, Ind.

BERNARD WATERS.

New York Athletic Club.

Oct. 3.—On their grounds at Travers Island, the New York Athletic Club held their opening shoot of the fall season. Event 2 was at 100 targets, handicap allowance added as breaks. Mr. H. Walker was first with 100, Mr. C. M. Meyer was second with 98, and Mr. Gus Greiff, shooting from scratch, was third with 87. In a match at 25 targets between Messrs. C. M. Meyer and Gus Greiff, each broke 19 and tied. The scores:

IN NEW JERSEY.

Berea Gun Club.

BEREA, O., Sept. 24.—The second annual tournament of the Berea Gun Club was held to-day on the club's new grounds, south of Berea village. The shooting commenced at 9 o'clock and continued until late in the afternoon. The affair proved a success in every particular. Marksmen from all parts of northern Ohio participated in the shoot.

The average for high gun was won by Quayle, of the Berea club, breaking 88 out of a possible 90, the last 64 straight.

Jackson Park Gun Club.

Paterson, N. J., Oct. 3.—The Jackson Park Gun Club, famous for its gatherings of good sportsmen and good competition, held a live-bird shoot on its grounds to-day. The renowned trapshooter, Capt. A. W. Money, was in excellent form, and took the first event at 5 birds with a straight score. In the second he was tied with three others with 8 out of 10. In the last event, at 10 birds, he tied with two others with a score of 9. The scores:

First event, 5 live birds:

The ten live bird match at Rodgers on Saturday afternoon between Robert Radcliffe, of the Jackson Park Gun Club, and an unknown, resulted in a victory for Radcliffe by a score of 9 to 6. The scores:
Radcliffe.....1121012121—9 Unknown.....2122020002—6

Lehigh—Independent Team Contest.

BETHLEHEM, Pa., Oct. 5.—Herewith are the scores of the return bluerock match between the Independent Gun Club, of Easton, and the Lehigh Rod and Gun Club, of Bethlehem. Ten men shot on a side, on Oct. 3, at Easton. It resulted in a victory for the Bethlehem team by the score of 196 to 195.

The Bethlehemites say they cannot find words to express their admiration of the manner in which they were treated by their opponents. They had a team to meet the boys at the car and bring them back, and after the shoot they entertained the team with a fine supper.

The high score for the day was made by J. Maurer, 25 straight, for the Easton team, and D. S. Daudt, 24, for the Bethlehemites.

H. F. Koch, Sec'y.

Albemarle Gun Club.

RICHMOND, Va., Sept. 26.—The Albemarle Gun Club held its club shoot to-day. The club medal was won by Mr. James Hayes.

The scores were, 25 targets: Boschen 12, Clay 6, Martin 11, Hayes 18, J. Cary, Sr., 15, Hoschen 15, Clay 5, Farmer 12, J. Cary, Jr., 10, Peters 16, Glasgow 11.

Thursday's shoot resulted as follows: A. W. Browning 13; Peters 15, Thompson 15, Edwards 13, H. F. Browning 22, Clay 10, Witt 10, Frazier 9, C. Farmer 16, E. Landrum 16.

ON LONG ISLAND.

East End Club, 17yds.—Dr. Hillsman 20, Anderson 15, Brown 2 Boudar 19, Flippen 23; total 97.

Illinois State Shoot.

PEKIN, Ill., Oct. 1.—The management announced this morning that this would be the last day of the tournament, and that the programme would be finished if possible. The Pekin handicap entrance was changed from \$25 to \$12; three moneys for every ten entries.

The pigeon handicap was changed from \$25 to \$15 entrance. F. C. Riehl was the only one to score straight in the pigeon handicap, and won first money. S. A. Tucker and W. Fred Quimby were on the grounds to-day.

The tournament has been a success financially, and with the changes made in shooting for the trophies, a large attendance can be looked for next year.

Many prominent shooters from all over the country are present. Among them are: William R. Crosby, O'Fallon; C. W. Budd, Des Moines, Ia.; John Burmister, Spirit Lake, Ia.; Guy Burn-sides, Knoxville; C. M. Powers, Decatur; W. A. Waddington, Beatrice, Neb.; Tom Marshall, Keithsburg; J. M. Hughes, Palmyra, Wis.; John Boa, Chicago; Russell Cline, Spirit Lake, Ia.; Harry Watson, Seneca, Pa.; Harvey Sconce, Sedell; H. H. Taylor, Mecklin, S. D.; Charles Wiggins, Homer; George Roll, Blue Island; J. B. Barto, Chicago; Fred Lord, Chicago; Frank Riehl, Alton; E. D. Rambo, Knoxville.

Sept. 29, First Day.

The programme presented twelve events, 15 targets each. Competition was open to all amateurs in Illinois. A gentle wind prevailed. In the total day's programme of 175 targets W. R. Crosby and Russell Kline, of Spirit Lake, Ia., tied on 175 breaks; Harvey Sconce was next with 174; H. Taylor, of Mecklin; S. D. Ellett and F. D. Ellett, Keithsburg, tied on 172; J. W. Hughes was fourth with 171.

The L. C. Smith cup was on the afternoon programme, and it had fifteen contestants. Four—Crosby, Burnside, Roll and Barto—tied on the possible 20 targets. Crosby scored 20 in the shoot-off and won. The weather was pleasant. The scores:

Sept. 30, Second Day.

The finish of the Board of Trade badge was the special event of to-day. Five men tied on perfect scores. Crosby was in the lead on the day's averages with 173 out of 180. Powers was next with 172. Kline and Watson tied on 169. Wiggins was fourth with 168. The tie in the badge event was postponed till to-morrow, though it was shot off partially.

In the annual meeting several important changes were made in the constitution. Lincoln was chosen for the next place of meeting. Officers, all of Lincoln, were elected as follows: President, Robt. Davis; Secretary-Treasurer, J. Davis. It was decided to change the L. C. Smith cup to a handicap event, 16 to 21yds. The Board of Trade badge was also changed to a handicap event, 26 to 32yds. The first is the individual championship at targets, the second represents the individual championship at live birds. The scores:

Diamond badge, 10 live birds, \$10 entrance, had only eighteen entries. There were five in the tie, which was finally won by the redoubtable expert, Mr. W. R. Crosby. He killed 10 straight in the main event, and 15 in the tie. Mr. C. M. Powers was the runner up. His 25th bird was dead out.

The number of contestants was exceedingly small considering the prestige, long list of associations and importance of the event.

The scores follow:

Harrisburg-Lykens Team Contest.

HARRISBURG, Pa., Oct. 3.—The return match between the trapshooters of Harrisburg and the trapshooters of Lykens, Pa., came off Saturday, Oct. 3, on the grounds of the East Side Shooting Association of Harrisburg.

The Lykens team arrived at 9 A. M., and were escorted by the reception committee to the Columbia Hotel, where arrangements had been made for their accommodation. Promptly at 11:30, dinner was served, after which the guests were taken to the grounds in a special car. The committee of arrangements had erected a large tent, under which refreshments were served free to the shooters. Although there were no straight scores made some of the shooters did remarkably well, as the conditions were unfavorable. The teams consisted of thirty men on each side, 25 flying targets per man. After the team race was finished a number of sprints were shot, some of the shooters staying until dark.

The Lykens team was under the leadership of ex-Senator A. F. Thompson, with Capt. Geo. Hawk as captain. The captain of the Harrisburg team was Mr. Harry Shoope. On the reception committee were Mr. James Warden, Mr. Frank Lawrence, Mr. A. H. Roberts, Capt. M. W. Long, and Carl Stewart. The general committee of arrangements was made up of C. W. Fisher, Ed Keffer, H. S. Lutz, C. Isenhower, H. O. Siehold, J. B. Singer, E. Kissenger and J. E. Martin.

Great credit is due the different committees for the able manner in which the affairs were conducted.

The official scorer was Mr. H. Debro; referee, Mr. Luther J. Squier. Scorer for Lykens, Mr. H. Hoffman; scorer for Harrisburg, Mr. Frank Lawrence.

Among the trade representatives present on invitation were J. R. Hull, L. J. Squier and Frank Lawrence. The scores:

Harrisburg Team.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Sept. 30.—The Rochester Rod and Gun Club shoot to-day was marked by good shooting in the cup event. Mr. Thomas F. Adkin broke his 27 without a miss. He won a point in the contest for the Adkin and Clark cup. The range

Adkin27	27	Coughlin30	15
Weller28	22	Clark28	23
20	22			

The contest for the cup becomes more interesting every week. The result will be decided Oct. 28. Several of the members have scored two or three points apiece.

The very beautiful cut showing the advertisement of Messrs. Cousens & Pratt, the Boston sail makers, can hardly fail to attract the attention of the readers who scan our advertising columns. Messrs. Cousens & Pratt are well known to yachtmen as particularly skillful and satisfactory makers of sails, and their product has borne to victory many a successful vessel. The beauty of this cut is very suggestive. Messrs. Cousens & Pratt invite correspondence from those who are building, or who contemplate building or refitting, yachts this winter.

WOMAN IN THE FIELD.

For many centuries the position even of civilized woman was that of an inferior. Unable, owing to lack of physical strength, to fight for the things she desired, she was obliged to take second place. Among the toilers of the world she toiled hardest. Happily this is now largely ended, and woman's position in civilization, and above all in America, is constantly improving. More and more she is coming to share man's pleasures, and if incidentally she is sharing his toils, in most of the avocations of life taking a position of her own, she is doing this voluntarily, of her own free will doing her share in the work of the world.

For many years FOREST AND STREAM has believed that there is no reason why woman should not share with man those sports of the field which bring humanity more and more into contact with nature. And the result of the doctrine that it has consistently preached is seen to-day in the constantly increased use by women of the fishing rod and the rifle, the shotgun and the golf club, the saddle horse and the canoe. There are even women who sail their own yachts, and often do it quite as well as men sail theirs. Yet it is to be remembered that to most women all this outdoor life is new, and that, as all of us learn how to do things only by doing them, so that the woman who takes up any outdoor sport as an adult, learns its mysteries with more difficulty than her younger sister who begins to use the various tools of her chosen craft as a little girl. Just as a man who puts off learning to shoot or cast a fly until middle life is obliged to go through a course of education to become proficient in the chosen art, so a woman must take lessons in the one she may choose. This is especially important when the art is to be practiced with a dangerous weapon. No one is likely to be injured in using a fly-rod, but it is a different thing when a shotgun is in question.

Nothing is more important, therefore, than that the woman undertaking this new pursuit should be taught by someone who is competent. This instructor is likely to be a brother, father, or husband, and he cannot devote too much care and effort to starting his charge just right. Habits—be they good or bad—are easily formed, and, once contracted, are hard to break. If, therefore, the pupil is taught to perform the various operations as they should be performed, if she is carefully watched and her attention called to each slightest infraction of the laws which the instructor has laid down, she will soon learn to do things precisely as he believes they ought to be done; and, by as much as she does them just in this way, by so much will she become constantly more and more a good comrade and reliable friend in the field or by the brookside.

Where one woman shoots, fishes or sails, a thousand ride on horseback, and these are exposed under present conditions to dangers which should be avoided. A woman should straddle a horse precisely as a man rides.

We have often called attention to the danger of the ordinary side-saddle—to the fact that the woman is wholly dependent upon her saddle girths, and in case of accident is absolutely without control over her own motions. She can cling firmly to her saddle, but that is all she can do. If anything goes wrong with the saddle, if a girth bursts, a strap breaks, a buckle tongue pulls out, and so the saddle becomes loose, it is impossible for the woman either to remedy the mischief or to jump free and clear of the saddle, and take her chance of a fall. On the other hand, the man or the woman who rides astride is free. If the accident to the saddle is slight, the rider is still able to cling to the horse from thigh to ankle, or if the horse cannot be ridden, then the rider is free to roll off or jump off with an even chance of striking the ground feet first; while the woman who falls from, or with, the side-saddle, is almost certain to strike the ground on her head.

These arguments have been so frequently insisted on that they have become familiar, and it is well that they have become so, for they have appealed strongly to the hard common sense of many American women. In a certain Western State, an editorial in FOREST AND STREAM on this subject converted all the young women of a county from riders of side-saddles to riders of men's saddles. Two or three young women, standing high in the social life of the community, grasped the force of the reasoning,

adopted the cross saddle, and were followed in the fashion which they set by practically all the woman riders in the county. Riding in this fashion they used to chase coyotes with greyhounds, and had many fine races.

Within the last few years the practice of riding a man's saddle has been extensively taken up in cities like Boston, New York and Chicago. Some women had the courage to adopt this fashion long ago, and more and more of them are doing it. It is not making a rash prediction to say that their numbers will constantly increase. Practically all the little girls now seen riding in New York ride astride as their brothers do, and as they grow up many of them will still cling to this sensible fashion. One of the best woman cross country riders in the United States has adopted it wholly on the ground of its greater safety and greater comfort. The fashion is especially to be recommended to those who by necessity or by choice ride in rough countries, or fast.

NATIVE SUFFERING IN ALASKA.

DISPATCHES just received from Alaska speak of the pitiful condition of the Indians and Eskimo who are said to be starving and for whom help is needed. In these dispatches an attempt is made to put the blame for this human suffering on the new game law, passed by Congress last June, and to show that this law has produced great hardship by destroying the fur trade, and making it impossible for the Indians to kill food.

The only definite statement that we have seen on the subject is that of Lieut. Jarvis, collector of customs for Alaska, who declares that the enforcement of the new law means entire suppression of the fur trade, and seems to involve the very existence of the native Indians and Eskimo. "These people," he says, "are already in a most deplorable condition, reduced by restrictions gradually placed on their pursuits both by the law and by the presence of white men in the country. Their margin of existence was never narrower, and any unusual happening invariably produces want and starvation. Inroads of white people have driven off their game, have taken their fish and food animals, and necessarily have changed their modes of living and clothing, reducing them to such a low condition that in the past few years they have in thousands fallen easy victims to starvation and epidemics of disease introduced among them. It is shown that their inability this year to secure black and polar bears, seals, walrus and whales, have reduced the natives to starvation. Several scores have already died."

The new Alaska game law was enacted for the purpose of preserving from absolute extinction by the head and hide hunter several species of great game which were apparently on the point of being swept out of existence. One species of caribou already had been killed down to a point where it never can recover. The white sheep, the giant moose and other species of great game were continually made merchandise of by white men who exported the heads and hides to the United States, and sold them for a large price, thus destroying the food on which the natives depended. Therefore Congress, in its wisdom, determined to forbid the wanton destruction of wild game animals or wild birds, and the destruction of nests and eggs of such birds, and did pass such a law. But, having regard to the conditions of Alaska and its inhabitants, it made in the first section of that law certain special exceptions providing that nothing in the act should "prevent the killing of any game animal or bird for food or clothing by natives, Indians or Eskimo, or by miners, explorers or travelers on a journey when in need of food." Fur-bearing animals are not mentioned in the act, which has to do wholly with game animals, game birds, and wild birds that are not game. Game animals and game birds are defined, and while among the animals are included sea lions and walrus, the exception in favor of Indians, Eskimo, and white travelers makes mere nonsense of the reports which come from Nome, including Lieut. Jarvis' statement just quoted.

The Alaska Indians and the Eskimo are undoubtedly in a most pitiable condition. They are weakened by disease and by hunger, and starving and dying. They need the sympathy, and, far more, the material aid of the United States Government, and of every man who can reach out a hand to help them, but to put the blame for

their condition on the Alaska game law is to attempt to evade the responsibility which this government and civilization at large cannot escape shouldering. Greed for gold has brought into once desolate and game-filled Alaska a horde of white men, and they have brought to the natives here all the ills that civilization ever brings to primitive man. The food provided by nature has been destroyed or driven away, and, in addition, these simple people have been infected by all the diseases of civilization. The United States has done nothing to provide for these changed conditions except to import a few reindeer from Siberia, and to distribute these among certain of the Eskimo. If any remnant of these suffering people is to survive, this work should be continued, and in the meantime the game law should be kept in force.

OCTOBER.

ALL months of the year, whether of spring, summer, autumn or winter, bear something seasonable, beneficial and beautiful for the use and enjoyment of mankind. Yet each season possesses peculiar benefits which appeal to quite distinct classes of people.

As a matter of sentiment, the springtime, with its mellow sunshine, home-building song birds, opening buds, and floral color, appeals broadly and happily to all mankind; and dull, indeed, is he who, in adolescent years, has not struggled to frame the strong poetic spring feeling of his being in the weak vocabulary of words due to acquisition. Poets are born; words are made. Many a masterpiece of springtime poesy, flowing from the purest fountain of the youthful, and, betimes, aged heart, has miscarried because the words would not rhyme properly, or fit the idea properly if they were true in rhyme, if, indeed, the notes of the sweet spring song could be presented in words which would express it at all. The spring is not without its place of firm esteem in the hearts of the angler, him of the gentle art which has held its place unbroken as a gentlemanly sport from time immemorial.

The summertime, to the sportsman, is a period of rest in the main, while making notes of the signs concerning the fall game supply, and quietly making trifling preparations for the fall sport. The exigencies of the times now require that a sportsman, who is earnest in his sport, must post himself thoroughly in advance concerning a locality with a game supply. The modern sportsman, after diligent seeking, or otherwise obtaining good information and privileges, does not consider it incumbent on himself to inform the world of all he knows concerning his favorite shooting ground which he anticipates enjoying himself, which may reasonably be considered as the elementary manifestation of the principle on which rests the institution known as the private game preserve.

The fall season brings with it the months highest in the esteem of the sportsman. Of these, October is laden with varieties of the sportsman's enjoyment. The ruffed grouse, swift of wing, alert and strategic, taxing man, dog and gun to the utmost, may be pursued in all the States in which he has a habitat, and the reports concerning this bird's abundance are almost uniformly favorable from every section. The heavy foliage which still obtains in many sections, is at present the greatest impediment to good sport.

The reports of the season's quail supply are also favorable as concerns the general situation, and they, too, add greatly to the sum total of October offerings in the way of sport.

Woodcock shooting, in a number of sections in which that bird makes its haunts, has been better this year than in recent years, although the recent heavy storms have sadly upset all plans and knowledge concerning the flights. The local hatchings and supply has been exceptionally good in many sections of New York State.

The big-game reports concerning deer and moose have been pleasingly favorable, although regrettable, if true, there were rumors of much big-game killing before the season opened, and of these rumors Maine was not free.

The principle of discrimination against non-resident sportsmen seems to gain ground steadily everywhere, and the game preserve interest is extending, the lesson of which seems to be that he who desires to enjoy the October days in the free and full style of years past, will need to identify himself with some landowner in a game section or become an owner of a preserve himself.

The Sportsman Tourist.

Swallows.

It was only a schoolboy's gray old barn
Where catnip and smartweed thrive;
Where a straw-stack stood on the bank of the tarn,
And the cattle we called a drove
Stood and browsed, or wandered about the yard
As the milking time drew near;
Where the gates were closed and the fence was barred.
But the wide-cracked barn was dear
For the urchin who stole away from school
To lie on the hay-mow high,
And free from the thralldom of teacher's rule,
He watched the swallows fly,
And perch by their nests on the purline plates
To bow and twitter and sing,
Or snuggle together as happy mates.
How memories cluster and cling,
As here in the sunshine, swallows glide
O'er the river's quiet flow!
A swallow's blithe notes have opened wide
The gates of the long ago.

L. F. BROWN.

Thoreau.

It is something more than natural when things occur that divert a man's thoughts into remote channels by strange coincidences.

A few days ago, amid a lot of rubbish thrown out of a miner's cabin in an obscure ravine in the Shasta Mountains, I noticed an Atlantic Monthly of June, 1862. Glancing through its pages, which were in a good, fresh-looking state, considering the age and location of the magazine, I noticed some articles upon the Civil War, in progress at the time of its issue, and brought it away with me to my wickypup.

The first article in the magazine was "Walking," the first of a series to follow by Thoreau, the proof sheets of which had been corrected during the last weeks of the author's life, and which were published during the year in which he died—1862.

The same day I received FOREST AND STREAM for Sept. 12, and the first article after the editorial matter is a commentary upon Thoreau by your contributor T. J. Chapman, in which he quotes President Jordan, of Stanford University as characterizing Thoreau "the Chief Prophet of the Order of Saunterers."

Mr. Chapman asserts in advance that "it is difficult to characterize Thoreau; difficult to understand what his chief motive in life was; but he seems to have had in mind to give the world a practical illustration of the doctrine of plain living and high thinking."

If Mr. Chapman has studied Thoreau he may perhaps award him a more exalted title than does the learned professor; but I do not presume to contend that a Chief Saunterer is altogether inappropriate to so great and singular a person.

I would merely ask the attention of Mr. Chapman to the essay upon walking, if he is not already familiar with it. As it appears in this old number of the Atlantic Monthly, the author says in his short preface:

"I wish to speak a word for nature, for absolute freedom and wildness, as contrasted with a freedom and culture merely civil; to regard man as an inhabitant, or a part and parcel of nature, rather than a member of society. I wish to make an extreme statement, if so I may make an emphatic one, for there are enough champions of civilization: the minister, and the school committee and every one of you will take care of that."

In the foregoing brief preface or preamble to this series of essays—"Walking," "Autumnal Tints," and "Wild Apples," etc.—it would seem that Thoreau has given something of his creed or doctrine of the science of existing. I do not believe it is very difficult for one who has come in close contact with "absolute freedom and wildness," and with "freedom and culture merely civil," to understand the nobility of Thoreau. But to do so the man must be free enough to contract the two states without inbred bias or prejudice either way.

I believe the entire essay, "Walking," by Thoreau, would find many attentive readers if reproduced in FOREST AND STREAM; but I shall offer but a few extracts from it bearing upon what seems to me to be glimpses of the real character or disposition of the author.

Alluding to himself as a walker, he says, as to himself and a companion: "We have felt that we almost alone hereabouts have practiced this noble art, though, to tell the truth, at least, if their own assertions are to be received, most of my townsmen would fain walk sometimes as I do, but they cannot. No wealth can buy the requisite leisure, freedom and independence which are the capital in this profession. It comes only by the grace of God. It requires a direct dispensation from heaven to become a walker. You must be born into the family of the walkers. Ambulator nascitur, non fit. Some of my townsmen, it is true, can remember and have described to me some of the walks which they took ten years ago, in which they were so blessed as to lose themselves for half an hour in the woods; but I know very well that they have confined themselves to the highway ever since, whatever pretensions they may make to belong to this select class. No doubt they were elevated for a moment, as by the reminiscence of a previous state of existence, when even they were foresters and outlaws.

"When he came to grene wode,
In a mery mornynge,
There he herde the notes small
Of byrdes mery synngynge.

"It is ferre gone, sayd Robyn,
That I was last here;
Me lyste a lytell for to shote,
At the donne dere."

"I think that I cannot preserve my health and spirits unless I spend four hours a day at least—and it is commonly more than that—sauntering through the

woods and over the hills and fields, absolutely free from all worldly engagements. You may safely say 'a penny for your thoughts,' or a thousand pounds. When sometimes I am reminded that the mechanics and the shopkeepers stay in their shops not only all the forenoon, but all the afternoon, too, sitting with crossed legs, so many of them—as if the legs were made to sit upon and not to stand or walk upon. I think they deserve some credit for not having all committed suicide long ago.

"I, who cannot stay in my chamber for a single day without acquiring some rust, and when sometimes I have stolen forth for a walk at the eleventh hour of 4 o'clock in the afternoon, too late to redeem the day, when the shades of night were already beginning to be mingled with the daylight, have felt as if I had committed some sin to be atoned for, I confess that I am astonished at the power of endurance, to say nothing of the moral insensibility, of my neighbors who confine themselves to shops and offices the whole day for weeks and months, ay, and years almost, together. I know not what manner of stuff they are of, sitting there now at 3 o'clock in the afternoon as if it were 3 o'clock in the morning.

"No doubt, temperament, and, above all, age, have a good deal to do with it. As a man grows older his ability to sit still and follow indoor occupations increases. He grows vespertinal in his habits as the evening of life approaches, till at last he comes forth only just before sundown, and gets all the walk that he requires in half an hour. But the walking of which I speak has nothing in it akin to taking exercise, as it is called, as the sick take medicine at stated hours—as the swinging of dumb-bells or chairs—but is itself the enterprise and adventure of the day. If you would get exercise, go in search of the springs of life. Think of a man's swinging dumb-bells for his health, when those springs are bubbling up in far-off pastures unsought by him!"

So many of his words upon his subject, walking. Let me quote a few paragraphs as free of his topic as his soul would be of conventional customs, although the paragraphs are from the same essay:

"In short, all good things are wild and free. There is something in a strain of music, whether produced by an instrument or by the human voice—take the sound of a bugle in a summer night, for instance—which by its wildness, to speak without satire, reminds me of the cries emitted by wild beasts in their native forests. It is so much of their wildness as I can understand. Give me for my friends and neighbors wild men, not tame ones. The wildness of the savage is but a faint symbol of the awful ferocity with which good men and lovers meet."

"I rejoice that horses and steers have to be broken before they can be made the slaves of men, and that men themselves have some wild oats still left to sow before they become submissive members of society. Undoubtedly, all men are not equally fit subjects for civilization, and because the majority, like dogs and sheep, are tame by inherited disposition, this is no reason why the others should have their natures broken that they may be reduced to the same level. Men are in the main alike, but they were made several in order that they might be various. If a low use is to be served, one man will do nearly or quite as well as another; if a high one, individual excellence is to be regarded. Any man can stop a hole to keep the wind away, but no other man could serve so rare a use as the author of this illustration did."

"While almost all men find an attraction drawing them to society, few are attracted strongly to nature. In their relation to nature, men appear to me for the most part, notwithstanding their arts, lower than the animals. It is not often a beautiful relation, as in the case of animals. How little appreciation of the beauty of the landscape there is among us! We have to be told that the Greeks called the world Beauty or Order, but we do not see clearly why they did so, and we esteem it at best only a curious philological fact.

"For my part, I feel that with regard to nature I live a sort of border life, on the confines of a world into which I make occasional and transient forays only, and my patriotism and allegiance to the State into whose territories I seem to retreat are those of a moss-trooper. Unto a life which I call natural, I would gladly follow even a will-o'-the-wisp through bogs and sloughs unimaginable, but no moon or firefly has shown me the causeway to it. Nature is a personality so vast and universal that we have never seen one of her features."

"We are accustomed to say in New England that few and fewer pigeons visit us every year. Our forests furnish no mast for them. So, it would seem, few and fewer thoughts visit each growing man from year to year, for the grove in our minds is laid waste—sold to feed unnecessary fires of ambition, or sent to mill, and there is scarcely a twig left for them to perch on. They no longer build nor breed with us. In some more genial season, perchance, a faint shadow flits across the landscape of the mind, cast by the wings of some thought in its vernal or autumnal migration; but, looking up, we are unable to detect the substance of the thought itself. Our winged thoughts are turned to poultry. They no longer soar, and they attain only to a Shanghai and Cochinchina grandeur. Those gra-a-te thoughts, those gra-a-te men you hear of!"

"We hug the earth; how rarely we mount! Methinks we might elevate ourselves a little more. We might climb a tree, at least."

"Above all, we cannot afford not to live in the present. He is blessed over all mortals who loses no moment of the passing life in remembering the past. Unless our philosophy hears the cock crow in every barnyard within our horizon, it is belated. The sound commonly reminds us that we are growing rusty and antique in our employments and habits of thought. His philosophy comes down to a more recent time than ours. There is something suggested by it that is a newer testament; the gospel according to this moment. He has not fallen astern; he has got up early, and to be where he is is to be in season, in the foremost rank of time. It is an expression of the health and soundness of nature, a brag for all the world."

It seems to me that much character and motive lies

uncovered and exposed in the few extracts given. Few men could write such paragraphs as those, and there are not a great number who would interpret them alike. I do not understand them as implying a sneer at the attainments of men in art and civilization, but I believe they contain the confident, caustic criticism of a powerful mind, embittered by the defects and shams so readily and universally sanctioned by society. If Thoreau tried to put his feet into a pair of "tooth-pick" or French toed shoes to find that they hurt or pinched, he would tell the whole French nation that he did not like them. If there were not other shoes he would make some for himself. In contrasting civil culture and conventional customs with nature's wildness his words and his life attest that he abjured the former for the other as far and as fearlessly as he could. He is one of those who

"Make for themselves a fearful monument!
The wreck of old opinions."

In my estimation Thoreau was more than an exalted saunterer. He was of the heroic pioneer strain. He did not like the highway, where men and mules crowd forward half stifled by their own dust, and he kept out of it as well as he could. He did not approve of houses like jails, and he shouldered an ax and constructed one in the woods to his liking, evidently regretting the expenditure of \$28 for its furnishings as a concession to civil culture not wholly necessary. He did not sanction the hypocrisy of civilized men and did not hesitate to say he would prefer wild ones for his neighbors.

Thoreau's achievement in building his house with his own hands and living for two years or so in the tame wilderness was remarkable chiefly in showing the fearless determination of his independent nature. The fact that he existed as he did is known to the world merely because of his literary intellectual attainments. He hewed a wider clearing and blazed out more territory with his pen than ever with his ax. Thousands of silent pioneers and foresters have exerted more power, endurance and physical fortitude in the real strife with American frontiers than did Thoreau.

Let almost any man spend as brief a time as two years in a wilderness—even though it be no wilder than that about Concord, Massachusetts, was in 1860—let him really keep himself aloof from the throngs of his kind and their cities and towns; let him live as simply as did Thoreau, contemplate the animal and plant life closely; let him be exposed more or less to severe privations; let him see forests shrivel in flames and storms break in fury over mountains, floods bursting in yellow frenzy down roaring gorges—let him in solitary obscurity see the lightnings rend, the thunder shake the earth, and let him know that the activity of his own brain, the efforts of his own unaided strength must protect and preserve his insignificant self from terrifying destruction upon every hand; let him see the morning break over vast solitudes, and the wonder of the sunrise, and all the real majesty of the world!

Take that man to Rome, to Venice, to Paris, or to New York, and show him the achievements of civilization, centralization, competition and wasted intelligence. With Thoreau's brain the man might discern imperfections in civil culture and conventional tendencies. With Thoreau's fearless nature the man might try to blaze a pathway in some wild direction. Viewed from these battlements I would consider the man neither eccentric to notable degree nor as inscrutable as some of your more civil optimists.

In this particular region of the world twenty or thirty years ago there was no end of hermits. There were men of every nationality and of every degree of intellectuality. The discovery of gold brought most of them to the Pacific Coast of California, but doubtless many came with the acquisition of the worshipped metal a merely incidental attraction. In a thousand crannies of the hills and mountains of California you might have found hermits of more absolute convictions and firmer, or rather more extreme, views than those of Thoreau. You might find the wisdom of all the "Old World" in a hut ten feet square and built of the crudest of rocks and logs in the gorges and ravines of the Sierras, while there were those ignorant to a degree that Thoreau might have called "beautiful," for he asserts that man's ignorance is not only sometimes useful but beautiful.

Twenty-five years ago I was presented with "Tupper's Complete Poetical Works" by a pioneer and a hermit of this region. The volume was inscribed as follows:

"To _____,
From his friend, _____."

A member of the Society of California Pioneers, by profession a miner, a Physician, a Materialist, a lover of Nature, and a bitter foe to ignorance, intolerance, and superstition. The present system of Christian education fills your penitentiaries, your poorhouses, and the streets of your cities are swarming with the monstrosities begotten of an Orthodox Christian Mythology.

I long for the time when man, emancipated from the thralldom of Priests and Myths, shall be able to conceive the sublimity of Nature's laws, and by living in accordance with them shall purify the people and the government; and that a philosophy so founded, practiced and taught, will produce a nation greater and nobler than any history makes mention of."

The doctor was an influential citizen, when he went to town. I have seen conventions of people listen respectfully while he addressed them, and upon more than one occasion he was conspicuous in local history for the maintenance of good order and the welfare of the community near which he lived. He might have commanded seniors or Senators. Like Thoreau, he was a pioneer, but not necessarily either eccentric or inscrutable.

A Popular Man.

DINWIDDLE—I wonder if I could induce the commodore of your yacht club to be the agent for my firm's champagne?

Ottinger (confidently)—Don't bother about him. You make me the agent for your champagne and the club will make me commodore.—Puck's Library.

A Night Scene in Maine.

NEW YORK, Oct. 6.—*Editor Forest and Stream:* One night in the fall, a few years ago, I witnessed a scene in northern Maine, a description of which, I think, is worth recording.

I was encamped with Louis Nicholas and Sebat Tomah on the thoroughfare between Eagle and Churchill lakes, on Allagash waters, where I had gone in quest of moose. At that time it was not considered unsportsmanlike to call moose, and the law allowed hunting during the rutting season.

About 8 o'clock in the evening Louis and I paddled across the thoroughfare and took up our station, concealed by some rushes on the western side. The sun was just sinking below the horizon and the clouds were colored with grays, pink, crimson, orange, yellow and gold; while the sky was of a blue, changing from a deep tint to a turquoise hue. Louis gave a few ineffectual calls. Meanwhile the sky clouded over, and the dark green background of pines and spruce on the opposite shore, now almost black, was lightened only by vivid flashes of lightning in the southern sky.

After an interval, the clouds cleared away, and the stars came out and fairly scintillated in the clear, cold atmosphere, and there was no sound to disturb the weird call of the horn except the occasional whistle of a loon as he flew over, and once in a while a hoot owl calling to his far distant mate.

Presently it again clouded over, and everything was hushed; and then, out of the east, there came a strange light of long streamers occasionally flashing upward to the zenith, followed by the development of a broad, bright, golden band below them, which gradually extended itself in the form of the arc of a circle, until it reached from the horizon on the east to the horizon on the west, with the long flames flashing upward, and some of them now turning to red. Then out of the east came the most wonderful phenomenon. I cannot describe it better than to state that it seemed as if a great hand had taken a long, broad, curled, silver shaving and seizing it by one end waved it slowly across the golden band, so that the light on the curled silver appeared now here, now there, on different parts, while other parts temporarily vanished. This display of the aurora lasted for an hour, and then the clouds again plunged us once more into gloom.

But the freshening wind gradually dispersed the clouds, and the risen moon gave them a silver lining while its beams danced on the waves of the lake.

As we turned to go home, I said to Louis, "Louis, have you ever seen such a sight as we saw to-night?" He replied, "Seen what?" "Have you seen nothing to-night?" "No."

And yet we had seen in one evening all the natural lights which the heavens display to man.

I do not expect to see such a sight ever again, nor is it all of hunting to shoot a moose.

J. E. HINDON HYDE.

NEW YORK, OCT. 6.

One of the Veterans.

To those who have long known and loved the Adirondacks, the passing of the veterans who established and made honorable the profession of the Adirondack guide, is saddening, like the depletion of the woods themselves. Neither can be replaced. To cherish both is of lasting value. The one presents an example of noble manliness and fidelity, the other a model of elegance, because combining beauty and utility. If it be claimed that this is mere sentiment, the answer is emphatically no—it is also truth. At the same time spare us the infliction of souls without any sentiment. It has a large place in the work and joy of living. It is, therefore, a pleasure to sketch in outline the career of one of the veterans, Nathaniel S. Graves.

Born in Unity, N. H., in 1832, he has manifested the proverbial ingenuity, mechanical skill, pluck and energy which have made the genuine Yankee so large a factor in the building of this nation. When nineteen years old he visited an uncle living at Keene, Essex county, N. Y., and enjoyed his first deer hunt in the Adirondacks. He went with his uncle and a young fellow named Avery (now living at Long Lake) to hunt near North Elba. The uncle spied a deer coming toward them, and directed that all should get down in the grass and keep still until the word fire, when all should fire together. Young Graves rested his rifle across his uncle's shoulder. When they fired at short range the uncle said, "You got him." Graves said, "How do you know we got him? Perhaps your bullet dropped him." "No," said the uncle, "it didn't, for my gun didn't go off. Only the cap snapped." Avery was asked, "Where did you hit him?" and replied with confidence, "In the head—where did you hit him?" Graves answered, "In the hind parts—for uncle moved and disturbed my aim just as we shot." Examination showed an ear just clipped by Avery's ball and both hind legs broken by Graves. This was in the spring. Graves then went to relatives in Boston and spent the summer there in work. Then with a brother and brother-in-law came to the Adirondacks on a hunting trip. At Upper Saranac Lake they found the only hotel in the Adirondacks, a three-room log house, kept by three brothers named Martin, one of whom afterward kept the well-known "Martin's" on Lower Saranac. Of a neighbor a few miles away the Martins hired a yellow cur at 25 cents a week, to run deer for Graves and his company. They got every deer they run, and the races were generally short. Trout were abundant everywhere. The hunters lived on the fat of the land. They hired a boat of Wm. MacClenathan (spelled according to pronunciation by Mr. Graves), Uncle Mac, they called him, who had built the first boat known in all the region, and may be styled the father of the Adirondack guide boat. A neighbor of Uncle Mac's had built a boat after his model, and these two were the only boats known to exist in the woods at that time. These boats had a narrow, square stern, but were otherwise and in a general sense the model after which all succeeding Adirondack boats have been built, says Mr. Graves. That winter he stayed with his uncle at Keene, and cut 300 cords of 4-foot wood at 40 cents

a cord. But he did not have to split nor pile it, as it was for burning in a coal-pit. He was used to hard work, for his boyhood life had been strenuous. When 11 years old he began to work out for \$8.33 per month and a winter's schooling. His employer did not send him to school, and young Graves' father sued the employer for this violation of contract, and recovered damages. But the boy did not get the money.

A brother was hired by another man, who soon reported to the father, and the following dialogue took place: "Graves, that's too big wages for that boy."

NATHANIEL S. GRAVES.

"Send him home, then, if he don't earn it." "I didn't say he didn't earn it, but it's too much—more than he ought to earn." "He'll have to earn it at home." "Then he might as well earn it for me."

The boy stayed his year. These incidents illustrate some phases of early New England life and the growth of that fiber which made the character of Western pioneers as well. But that was before the days of trades unions, dominated by walking delegates and the (lack of) principle of the largest wages for the smallest amount of labor. O tempora! O mores!

The next spring, after cutting the wood, Graves built a boat, modeled from memory, after Uncle Mac's. So far as known this was the third boat built in the Adirondacks.

SHOP AND HOME.

After a hunt Graves went to Boston and stayed several years. But the love of the woods was on him; he had seen very desirable timber land around the head of Big Tupper Lake; thought he would like to live there, and when Moses A. Horrick, manager of the Underhill Hardware Co., of Boston, offered to give him 160 acres a half mile west of Big Tupper if he would move up there, he promptly took it. He then lived about Big Tupper five or six years, and cut the first road to Horseshoe Pond. About this time guiding began to come in vogue, and little by little Graves began to guide on Big Tupper and Bog River. About this time also Paul Smith came out with a white boat, guided some, and in about two years started a hotel in a little log house. This was the beginning of the now famous hostelry. At this time Graves took a sport and his guide to Bog River for trout. The sport had a fancy rod, and Graves said to him, "Leave your fancy pole in the boat—I'll give you all the fish you want—only don't show yourselves in sight of the water." So Graves cut a birch lamming pole, posted the two men behind a stump, where they could fish unseen by trout, went to fishing himself, and for a while the three men "had a trout in the air about all the time."

One season Graves went to Bog River with two others to hunt for market. They saved the hides and jerked the venison. Most of the hunting was done at night. During the day time they dressed the deer killed the previous night. In eight days' time they killed so many that Graves' share of the net proceeds was \$83. "That's what we could do in the Adirondacks before sporting people came in here. Now guides cannot get a living," said the old man when giving the writer this account of his life. Then the

law placed no restriction on the number of deer a man might kill in one season, and the close season was only from Jan. 1 until spring, or time for night hunting. Hemlock boughs were then used for camp beds. Balsam was not yet fashionable. Trapping fur was a valuable adjunct to deer hunting, and, as both lasted till New Year's, the fall's work was generally profitable.

Later in life Mr. Graves had large experiences as a mining prospector in the West, and has been to the Rocky Mountains and back several times. He has been in several Indian fights and with 46 others was once captured by a large band of Apaches. A few years ago he drove with a horse and cart from near tidewater in Lower California across the Rockies and the plains to Blue Mountain Lake, N. Y. The journey occupied three months, during which he camped and cooked, earning money enough to buy food for himself and horse, by tinkering—cleaning hundreds of clocks and mending tinware. Mr. C. H. Downs, the skillful taxidermist at Blue Mountain Lake, bought the horse and cart, and still keeps them as curiosities.

Mr. Graves now lives at Blue Mountain Lake, in a little building he erected over the water, and which constitutes boat shop and dwelling house combined. Here he supports himself by building boats for sale and to rent. He is an earnest Christian of the Advent persuasion, and as such enjoys the respect of the community, for nothing will induce him to break his Sabbath in any way, and whatever men may believe for themselves, they respect consistency in others.

Enclosed is a photograph of the veteran, and also one of his shop house, and the writer is confident that whoever looks on the honest, kindly features of the old man will wish for him that his last days on earth may be as calm and peaceful as his earlier ones were toilsome and adventurous, and that in the next world he may fully realize his hope.

JUVENAL.

October in Nebraska.

OCTOBER. No other section in the country witnesses a more wonderful pageant of nature's paintings, during the mystic month now upon us, than does the always fair prairie State, Nebraska. Our autumnal days, and we have nearly two months of them, are little less than golden dreams, with their uniformly cloudless skies, floods of sunshine, harvest moons and entrancing radiance of hill, plain and wooded vale, where the azure of the jay's gaudy coat vies with the topaz of the flicker's wing, the Tyrian-dyed grasses and yellow and scarlet foliage. I used to think that the perfection of Jack Frost's frescoing and the acme of fall tints was to be found only in the oak and shellbark woods of old Ohio. It was there, I thought, on the gentle hills of Fairfield county, October hung her most resplendent jewels and spread her cloth of gold.

But there is a valley here, which twists and writhes and convolutes away through the paradisaical north-west country, from the city's very limits almost, where the snowy-barked cottonwood, the yellow and crimsoned maple, the purple plum, the blood-red sumach, all mingle with countless shades of green and dun, and these, with the silvery sinuosities of a clamorous river, make up a combination of contour and varied hues charming enough for the mythical land of elis and fairies. Now it is the level plain, pasture, grain and hay field, yellow with stubble and dotted everywhere with tidy farmhouses and rows and groups of stacks of hay and grain. Now it merges into a rolling land, over whose blue shimmering crest you see what appears to be a range of low mountains, which you long to reach and climb. But as you go on the hills seem to dissolve into the general level and you pass through miles and miles of modest undulations, like the long swells of a leafy ocean, with all the myriads of the waning summer's floral hosts springing from the fading sward and spreading like rich tapestries under the umbrageous trees. In consonance with the sentiment of the mellow time of maturity and harvest, that incomparable artist, October, touches each forest leaf, each branch, each tendril, and even to the tiniest blades of grass, with those magic dyes the June flowers were wont to stain themselves, kindling the whole valley with a glow that shadows even the most gorgeous sunset.

Until I trod the Elkhorn valley, by happy chance, I had little conception of the passion and intensity of autumn tints. In Ohio the foundation hue is yellow, the beeches, hickory, ash, elm, walnut, all yielding their different tones of gold, but along the Elkhorn, the species of Lilliputian oak, plum, crabapple, grape, gum and sumach, largely prevail, and it is these that flaunt forth the universal oriflamme, with the most vivid reds and bronzes and purples, of all their kind, while all the vines and weeds and grasses, instead of drying away into a dull gray, rival each other with their dazzling tints. Upon this kaleidoscopic ground is laid the exquisite embroidery of the low, straggling woods, with its hopple and its hazel arraying themselves in perplexing and mysterious combinations, with their dashes of madder, and splashes and splotches of maroon, of pink, of saffron, of gamboge and amber, mingling and intermingling with warming russets, drabs, grays and glows of duller texture. As the sun goes down in riant clouds, so Nebraska's autumn days depart in a halo of glory!

Gladsome, indeed, are these auriferous times to the sportsman—to the man who loves to hunt and the man who loves to fish. He needs no calendar to tell him that this is the chosen time. He sees the long, dotted lines stretched across the morning and evening sky, and he knows that the ducks are on the wing, and the faint breath which fills his nostrils with the odors of the ambrosia and wild chrysanthemum, bears to him, in imagination, anyway, the whir of the uprising chicken's wings. Down in the neglected pastures the feathery stems of the ragweed and brown, naked stalks of the sunflower are but pillars from which the yellow-bellied spider is stretching his lacework and the rowen fields are specked with faded asters, clover heads and the white panicles of the wild parsnip and the shriveled discs of the poppies. The dull yellow of the wheat stubble is tufted with ambitious mullin and bedraggled hemp, green still, but fast withering, and the daily

haunt of the turtle dove and chickadee. Later, here, Bob White will find his banquet board. By the roadside the starwort is blooming, and the tangled grapevines in the creek's bottom burn with the yellowish-red arils of the bittersweet, and down along the mucky shores of the marsh a rain of wild rice pellets is falling!

Quack! Quack! Quack!

Do you recognize that sound? Is it not alluring? Can it be successfully resisted with the sportsman's blood leaping in your veins? Along the low-lying meadows of the sprawling Platte the fluffy flag is fading, and a rufous tinge is stealing over the stately heads of the cattails, and the lance-like leaves of the squaw cane; the plumes of the goldenrod are drooping, and the heart-shaped leaves of the cottonwood are floating down the stream. The sounds that oftenest strike the ear are the clamoring of the marshalling crows, the chucking of the blackbirds, the bickering of the jays, or the answering chatter of the fox squirrel, never too engrossed in his nut rasping, down on that old butter-nut limb there, to indulge in a little habitual scoffing. Louder still than these, though not the voice of any of nature's wild things, yet so common at this time of year that you so class it, from marshland, wooded valley, lake shore and prairie, echoes the crack of the hammerless; now close by and startling, now away off, far out of sight, like a puff of the south wind. To one idling under October skies, these are sounds that open up vistas of stirring pictures with which the whole country is moving. Here on the gaudy prairie, where the versi-colored grasses and brown sunflower stalks mingle, it is a prairie chicken bursting like a gray rocket from its shriveling covert, the fluffy feathers floating like thistle down behind him; and then again it is one of those furry, bob-tailed, long-eared clowns of the plains, a jack rabbit, limping off on three legs through the purple tangle of frosted bluestem and fox-tail, or a belated upland, with long-pointed, down-curved wings, frantically turwheeling and endeavoring to catch up with the dim ranks of his departed kind. Off yonder on the broad level of the tule-hidden marsh, you catch but a wisp of whitish smoke in these days of the nitros, and then the faintest report, and a bunch of bluewing splash to flight from their sedgy feeding beds, or a big, fat mallard, with lagging orange legs, reluctantly leaves his natatorium among the smartweed and the rice; or a flock of tinkling yellowlegs, traversing, on slow, flapping sails, the bends and reaches in the tules; or a skaiping jack, in his rosewood dress, leaping from the flag-shrouded ooze and zigzagging away across the sunlit marsh, or mayhap, a lonely bittern or slovenly mudhen! When it comes from the woods, the hurtling wing of Bob White whirs through the trenchant air, or it is the leafy crash of a squirrel as he leaps from bough to bough, tree to tree, in a frantic scramble for that old hollow elm down there, or the yelp of a skulking coyote, late slinking home after a night's marauding around the rancher's abode. These are the pictures with which the sportsman's vision in fancy are filled in accompaniment to the sounds of October days.

OMAHA, Neb.

SANDY GRISWOLD.

Kipling's "Red Gods."

Editor *Forest and Stream*:

It is assumed that, in demurring to L. F. Brown's crushing analysis of Kipling's "Red Gods" lines, Mr. Hardy is not a Kiplomaniac, nor swayed by reason of any personal acquaintance or friendship for the Kiplings, who once lived in New England, and took several journeys into Maine.

So Mr. Hardy should, on reflection, see that the criticism is unanswerable, and that a defense of the lines after such a demonstration that they are the result of ignorance, may run the risk of being ludicrous.

For convenience the "poetry" is here reproduced:

"Do you know the blackened timber? Do you know that racing stream,
With the raw, right-angled log-jam at the end,
And the bar of sun-warmed shingle, where a man may bask and dream
To the click of shod canoe poles round the bend?
It is there that we are going with our rods and reels and traces,
To a silent, smoky Indian that we know;
To a couch of new-pulled hemlock, with the starlight on our faces,
For the Red Gods call us out, and we must go."

Any canoeist and camper knows that this is not only misdescription, but such entire folderol as to make it laughable to real sportsmen.

Kipling speaks of a log-jam as "raw," using the word as synonymous with unfinished. A log-jam is an aggregation of tree-trunk sections. No more finished and exquisitely fashioned creation of nature than a tree trunk! No painter ever even approximated the indescribable fineness and delicacy of the lines and work on the trunk of a tree. As Ruskin says: "Nature has taken wonderful pains with its forms, sculpturing it into exquisite variety of dint and dimple, rounding or hollowing it into contours which for fineness no human hand can follow; then she colors it, and its whole substance is full of hidden histories, concealing wonders of structure which, in all probability, are mysteries even to the angels." Kipling, in his blindness to, and ignorance of, Nature, calls such a structure "raw." Texture of bark, anatomy of muscle beneath, reflected lights in recessed hollows, stains of mosses and lichens, and wonderful delicacy of hues—all this is "raw." By similar reasoning the rough board sawed from that log, which is raw, should be called finished. As well call a steak cut from a quarter of beef finished.

And Kipling calls a log-jam "right-angled." When one side of an angle is perpendicular to the other, it is a right angle. And it is manifest that no log-jam can be right-angled either to itself or the stream; nor can its logs be right-angled to each other, for the ends point in all directions. The pictures of log-jams used by Mr. Hardy demonstrate this.

The truth is that the words "raw" and "right-angled" are cheap, premeditated alliteration which was preferred to accuracy. Thus the intelligent reader gets a painful sense of profound ignorance on the part of the writer.

Nothing is left for him but to reject with contempt the claim that this sing-song is wonderful knowledge—the rare insight of a genius.

And of course no log-jam was ever "at the end" of a "racing stream." Kipling states that this is where his impossible log-jam is located.

And Kipling's "Indian" used "shod" poles.

Here is what a man who has camped and slept under canoes for weeks during half the summers of the last forty years says to me on this subject: "The 'shoe' of a real canoe pole is a hollow tip or socket into which the end of the pole is inserted to keep the wood from splitting on rocks. But such shoes are exceedingly rare. I have never seen one used by an Indian, and only two pairs in use—one on the Margaree River in Cape Breton, and the other at John Connell's Camps on the Tabusintac River in New Brunswick. In each case I was told that the metal would slip on rocks, and so the shoe of metal was not satisfactory. This you will find to be the view of the best Maine guides, and of such British Columbia men as Brewster Brothers, of Banff, and the Abriels, of Nakusp. I have had three summer outings in a canoe on Maine streams, including the trip down the entire St. John's River, and I did not see a single shod canoe-pole; and I do not believe that white guides, much less one of Kipling's 'Indians' use a shod pole.

"Canoe-poles, as used by white guides for shoving canoes up quick waters, are usually made of maple or ash, 12 to 14 feet long, and about an inch in diameter at each end, and a little larger in the middle. Over one end a few white guides place, not a shoe, but a sleeve about three inches long, of copper, and adjusted so that the wood of the pole sticks out two or three inches, because the wood will 'hang' to a rock where any metal shoe would slip. And such sleeve (not shoe) does not strike the bottom, while the wood does. So the 'shoe' (sleeve) cannot 'click,' even when the pole is used on rocks that are not submerged."

As for myself, I have yet to see my first shod canoe-pole, and I doubt if I ever will see one outside of a museum. The genuine Indian certainly does not use them. Instead, when he has to pass up rapid water that precludes paddling, he selects and cuts a pole from the nearest suitable tree, and uses that in its "raw" state. When he reaches quiet water again, overboard goes the pole. He would no more think of carrying a canoe-pole on a trip than he would think of carrying tent-poles. He makes them as the occasion requires.

Trying to be "versatile" as a professional writer, Kipling thought it would be fine to pose in print as a canoeist, angler, and gentleman sportsman who had an "Indian" guide. He knew enough of metre and rhythm to get the proper number of feet into his "poetry." The rest is falsehood paraded as truth. He confounds the well-known semi-handspike of the laborer who "drives" logs in streams (which is tipped with an iron point or pick, and is often used around lumber camps to shove canoes up quick water) with the canoe-pole proper of the sportsman that he assumes to personify.

But suppose the canoe-pole that Kipling really did not use at his unlocated and imaginative scene that never existed (and could not as he describes it) were "shod." The dilemma and falsehood would only be greater. How could the shoes, immersed in from two to three feet of water, be heard to "click" as they touched the bottom? Worse, how could such "clicks" be heard "around the bend," even when they were being used in comparatively still water, instead of a "racing stream" that is full of turmoil and uproar? More inaccuracy! More offensive posturing as a proclaimer of special knowledge! It is a pitiful strut worthy only of a very common literary hack who is thinking of his audience instead of an outing which he never took.

It is intimated by Mr. Hardy that, as Mr. Brown writes from Sand Lake in his native Michigan, he cannot know conditions in Maine. It is, therefore, proper to state that Mr. Brown has spent eleven summer vacations along angling waters on the west slopes of the Canadian Rockies, and has camped in August above the snow-line, sleeping in a bag, in the Yo Ho Canyon region beyond Emerald Lake. He has fished in many lakes of Minnesota and Wisconsin, taken trout from the Campbell River on Vancouver Island, been poled up the Peribonca River, had a canoe smashed on Rupert's Stream, knows the Margaree in Cape Breton, some of the salmon waters of southern Nova Scotia, and has taken trout and salmon from several streams in western Newfoundland. Thus he has studied canoes and their poles and the "smokiness" of a half-dozen tribes of Indians, widely separated, as well as along the Manistee and Au Sable. Add that he spent three long vacations in Maine, and took the canoe trip from the headwaters of the St. John's River down to Conners, and that he has studied and written of Nature's aspects for thirty years, and it would seem that he should know just a trifle more than Kipling about log-jams and canoe-poles.

Mr. Hardy even says when he was a child, fifty years ago, he saw "Indians" so "smoky" and malodorous that he could tell with his eyes shut that one was in a room. If Kipling chose such a guide he lacked taste. For such a "smoky" Indian is very rare. The average Indian is never "smoky," but dark-skinned, tanned.

Mr. Hardy tells us that he "basks and dreams" in a hot sun on his comfortable seat of coarse "shingle"—water-worn stones—forming a "bar" from which the water has taken the only material of which a bar was ever formed, viz., dirt, mud, alluvium. He says that a bar is "anything which obstructs." Then, of course, his log-jam is a "bar," or, better still, so is a mill-dam. And he prefers jams of "second-year" logs, stripped of bark. His logs "grow" no moss except when in the water; and, as they do not there, moss was never on any log. A log is "raw" because it is "in its natural state." If a log in its natural state is raw, so is a rainbow, cloud, wild-flower or star. And he prefers Kipling's "couch" of hemlock, with its sweat and heat under the body of a sleeper, and its hardness and acrid odor, to the balsam-scented and cool, easy bed of spruce boughs! Further, he has seen canoe-poles that were "shod" in Maine (a merely provincial experience); so all over Maine and everywhere else, all canoe-poles are shod! And these shoes, very hammers of "railroad iron," always "click." Mind, he is defending Kipling's line stating that they can be heard on "racing streams," and he says that these small iron tips of his "shod" canoe-poles, as they touch

the bottom under several feet of water, can be heard "hundreds of yards," "long before the canoe comes in sight," and "often nearly as far as the human voice can be heard." The writer knows a dozen "racing streams" where even the human voice could not be heard fifty yards because of the turmoil, uproar, thunder and hiss of the water. Kipling never heard "clicks" of "canoe-poles" "around the bend" of any "racing stream."

And this "versatile" writer masking as a gentleman sportsman has his "couch" of "new-pulled" hemlock! placed so that he lies on it to sleep, it will be "with the starlight on our faces." Balderdash! The real sportsman sleeps under his canoe, in a tent, cabin, "shack" or "lean-to," or at least while protected by thick foliage above his head, to keep off dews and rain. He likes the starlight on his face as he angles at night for big trout, or mingled with the light from the camp-fire as he smokes with a comrade beside it, or as he sits in the canoe while he and his guide return to the camp; but never while sleeping on his bed of boughs.

Mr. Hardy does not try to answer the charge that Kipling's "Red Gods" are pompous poetic license gone mad. No "gods" of red, white, black, Prussian blue or chrome yellow, or of pepper-and-salt or brindle, "call out" the woodman. But wild Nature does beckon to him. Her blue lakes, emerald forests, music of streams, plashing of waves on beaches, wondrous saffrons and grays and tenderness and delicacy of purples at dawn, voices of foliage and winds, evening twilights, and above all, the mystery of her life, are not deities of any hue, much less "Red Gods." They are manifest messages from the only God telling us of blessings, beauty and grace of the earth made for man's enjoyment.

Neither is there any attempt to defend Kipling's senseless statement that he is "going" to some unlocated "racing stream" with "traces," which are sections of spinning tackle that are never used on "racing streams." Yet Mr. Hardy knows of no other such truthful "description."

One of the qualities of error is that it can trust to some self-styled prophet to proclaim it as a new and wonderful discovery of truth. And another quality is that when this "truth" is exposed as falsehood, it can further trust to some one to defend it.

R. W. ASHCROFT.

NEW YORK, Oct. 9.

LEWISTON, Me., Oct. 6.—*Editor Forest and Stream*: I have just received the issue of Sept. 26 and note the "musings" of L. F. Brown, of Sand Lake, Mich., to which he gives the sub-title of "Spurious Writings About Angling and Nature," the whole being a furious arraignment of the poet Kipling for almost every kind and degree of violation of truth and true poetic duty in his verses entitled, "The Feet of the Young Men."

He is "astounded" at "so much counterfeit writing about sport and nature," and "mistruth" and "inexactness" are the mildest of his terms of rebuke of Kipling.

To me, and I cannot doubt to the majority of the readers of his article, the only truthful and enjoyable part is the double quatrain which he quotes from the poem. But still it seems not well to let such an utterance pass without comment.

Ever since Chaucer wrote of the "Longen to gon on pilgrimages," and probably long before that, ever since the feet of young men have turned irresistibly to adventure in the wilderness, there have been those to whom Kipling's words would have come with ample response and answering thrill. I am this moment longing inexpressibly to be down in the woods and among the lakes I know so well—only a very few hours' journey from where I am at this moment—and to me no words could be more deeply stirring than,

"Who hath smelt wood-smoke at twilight? Who hath heard the birch log burning?

Who is quick to read the noises of the night?
Let him follow with the others, for the young men's feet are turning

To the camps of proved desire and known delight!"

Then follow the words—to me equally full not only of lilt and go, but also of most apt and accurate description and truth to nature—but which to Mr. Brown are a "splotteration" "surrounding and befouling" the true picture:

"Do you know the blackened timber? Do you know that racing stream,

With the raw, right-angled log-jam at the end,
And the bar of sun-warmed shingle, where a man may bask and dream,

To the click of shod canoe-poles round the bend?
It is there that we are going with our rods and reels and traces,
To a silent, smoky Indian that we know—

To a couch of new-pulled hemlock, with the starlight on our faces,
For the Red Gods call us out, and we must go."

Now, I will not say there is no finer descriptive poetry than that, but really, if challenged at the moment, I could not readily put my finger on anything better. It is "right as a trivet," every word of it, yet not a word of it escapes the railing abuse of Mr. Brown.

He claims to know all about log-jams and canoe-poles, not only at "Sand Lake, Michigan," but in the whole "United States" and also in "India, Norway, British Columbia and the Maritime Provinces of Canada," and will have it that "no actual log-jam is 'raw,' 'right-angled,' or 'at the end' of the vista, and that 'not one canoe-pole in a thousand' is 'shod' or 'clicks.'" He has never heard of a sand bar in his life, but deliberately states that "a 'bar' is always a deposit of alluvium earth-sediment which has gathered and formed a mud bank or island!"

After such a statement no sort of statement can be too extraordinary, and we need not be surprised at his saying that "there never was a 'bar' of 'shingle,'" and if there were, "no sportsman would ever dream of reclining on such a hard, hot, uncomfortable seat as a 'sun-warmed shingle.'"

He says there is no "smoky Indian," evidently supposing that Kipling's exquisite epithet refers to the Indian's complexion alone, although it is true of that.

It is impossible to understand how any man can write in this way with serious intent.

Natural History.

North Carolina Wild Horses.

NOTHING on the Atlantic Coast is more replete with curious features than the "penning" of the wild ponies in North Carolina. These animals, the descendants of the "little Barbary horses" which far-seeing Sir Walter Raleigh sent with his expedition to Roanoke Island in August, 1583-4, have their home only on the long and narrow sand-bank which divides the sea from the body of salt water known as Core Sound, the latter forming part of the long chain of "sounds" of various sizes which so mark the eastern portion of North Carolina.

Core "Banks," as this strip of land is known, is about sixty miles in length, extending from Old Topsail Inlet at Beaufort, to Ocracoke Inlet at Ocracoke. Along this stretch of mingled sea and beach, sand dunes, forests and marshes, are some 3,500 ponies, hardly little fellows, weighing on an average 750 to 800 pounds.

There are several "pens," really corrals; these having names, such as the Diamond, Jack's Island, Hunting Quarter, and Middle. The writer attended two of these "penning." One at the Hunting Quarter pen and the other at the Middle. There was a fleet of no less than sixty-seven sailboats of all sizes on the way to the Middle pen. The scene near the pen was vividly picturesque, and needed only coconut palms to make it tropical. There were the grass-thatched huts of the "crabbers," who search in the earliest spring for the toothsome softshell crab, while the vegetation, yeopon, dwarf live oaks, fan palmetto, pellitory and dwarf pines, added to the oddness. A slue or creek made close to the pen, and up this smaller boats went, persons from the larger ones wading to them or being carried on the backs of the sturdy boatmen. There was much merriment as all hands made for the pen, the time being then nearly noon.

Since dawn two gangs of men had been at work driving the ponies; one from the north, and the other from the south end of the long stretch of banks. Each gang of about thirty had fifteen miles to go, and the driving of the ponies out of that wild waste of scrub growth, marsh and sea shore was no easy task. One of these "drives" is known as the Northern Drive, the other as the Southern Drive. The men from the north made their drive fire, and here came the ponies, 200 in number, in a wild charge, being headed off by a long line of perhaps a hundred men, who prevented them from going southward.

Everything was strange, from the first view as the ponies, looking like a long line of cavalry in skirmishing order, appeared in the distance and came up on the run, with the penners or beaters in the rear. At that distance it was difficult indeed to tell land from water, and ponies and men appeared to be running on air. The line of beaters, all on foot, swept up ceaselessly but noiselessly, and the ponies, seeing their way southward blocked by the long line of men at right angles across the beach, dashed in a wild charge into the pen, a structure built of all sorts of driftwood, and some eighty feet square, with a large opening. On the instant that the ponies entered the pen, they packed themselves in a dense mass. Their faces were a study, many of them being as wild as a prehistoric horse ever had. They next rushed backward and forward, then 'round and 'round; in this frantic movement all joined, no matter whether the tiny colt or the veteran who had figured in many such scenes. First, the sea of pony faces turned one way, then the other; with little wild eyes and penthouse of hair hanging far over the forehead, the hair on the bodies of many being so rough as to make them look like alpacas or llamas. The manes of many were as long as the tails. The prevailing color was dun, but there were dashes of yellow, and one was almost black.

Strapping men plunged into this mass of struggling and quivering flesh, and first snatched out the little colts to save the latter from being crushed to death. Desperate indeed was the scramble, as they sought to seize the larger ponies. Those pursued sought refuge in the thickest of the press, which literally became a dangerous crush, and it appeared that rib-cracking must be a certainty, yet strange to say, neither pursuers nor pursued were in this case hurt. A veteran looker-on said that there were accidents at times, and that he knew cases where men had been killed in the pen.

All the beaters and other participants were fishermen, and their costumes made a picture in themselves; red shirts and blue shirts, high rubber boots, rubber hats, with an occasional palmetto hat of great size. Some went into the ruck wearing only a shirt and trousers, risking their bare feet amid that wild trampling of hoofs. There was an all-pervading odor of wild animals mingled with a milky smell and the salty tang of the sea air. Above everything rose the roar made by the incessant trampling of the ponies' hoofs. A giant negro, known near and far along the coast as Big Bart, dashed into the pen and seized a furious stallion. Bart is the most expert "seizer" on the banks, where there are only one or two negroes, and there was a rush of the white spectators to see his work. With his hands he caught the stallion by the nose and strained every muscle to hold him. Four or five times the animal broke away, while Bart renewed his efforts. It finally required eight men to help Bart hold the powerful stallion, after the big negro had gotten a secure grip on the animal's nose, and had nearly cut off his wind by pressure above the nostrils. The rough rope halter with the double hitch, which is alone used at the pens, was put on the stallion after a ten-minute contest, and then three or four men led the creature out of the pen.

Incidents happened like flashes, among these being fights by stallions, which reared up and fought with forefeet and teeth, and then lashed out with heels, hammering with resounding blows the sides of any animals in range, which yet seemed unhurt, so great

is their toughness. There was no lassoing during the penning; only the bare hands being used, it being a matter of special pride to thus take the ponies. So they have been taken, the records show, since 1713, when the register of brands begins. But these ponies were in use long before that date. The colts which follow the mares are all the property of the owners of such mares, the latter being branded; but the motherless colts—that is, the ones which do not follow any mares—are "mavericks," and become the property of the beaters or penners as a reward for the extremely arduous work the latter do in making the long drives. The tiny colts are first branded, and then the larger ones, while the penners brand their mavericks or "motherless colts," as they always term them. After the desired animals have been picked out and roped, the little boys were allowed to enter the pen and show their skill and prowess in seizing the yearling colts, their elders looking on approvingly. It was noticeable that the talk was all low, and that there was but one burst of applause. These coast people are a quiet sort, and chary of speech; really almost Quaker-like.

There was a steady driving of bargains for ponies. Prices generally ranged from \$25 to \$50. These shaggy little animals, taken from the bank, broken, cared for and given other food, quickly become glossy, lose their wild look, and are highly valued. The older stallions are always smoother of skin and darker, and not nearly so wild-eyed as the other ponies. None of these animals in their wild state ever eat anything save marsh grass and leaves of plants and trees, and so the ponies really have to be taught to eat the food given other horses. This is done by putting them in a stable beside a horse. The experiment of increasing the size of these ponies while in a wild state by placing horses on the banks has been tried, but failed, as the pony stallions invariably surround and kill the horses, which they regard as intruders.

After all the ponies secured by the northern drive had been picked over, those remaining, including the mares, which are never sold, were turned loose. Out of the wide gate of the pen they fled, but stopped when a few hundred yards away and began eating, the little colts, freshly branded, joining their dams. The drive of the ponies from the southward was next completed, and there was another stirring sight as the animals came up in a long-extended line. About a score of them suddenly executed a flank movement by dashing out into the shallow waters of the sound and making a wide circle around the line of beaters, returned to their wild home. The thunder of their hoofs and the showers of shining spray which they beat up in the shallow water made a striking spectacle, as they made their headlong dash for liberty, and in but a few minutes they had reached the sky line. The remainder of the ponies were with ease driven into the pen. The bottom of the latter was covered with rainwater to the depth of a couple of inches, and this had quickly become black mud. The ponies' feet threw out this mud in great splashes on the faces and bodies of the workers and the spectators, but nobody minded it in the least. The hoofs of some of the ponies, which are never shod, were a foot or more in length. This was generally the case with the older mares. Some of the latter were said to be over twenty years of age. The total number of ponies in the pen was 412.

The ponies which had been sold were, after more or less struggling, led down through the high marsh grass to the shore of the sound and were hoisted into the larger boats. The more modern of the boatmen hoisted them in with slings, while others let down a panel in the side of the boat and literally dragged the beasts in, this being the old-fashioned and really barbarous method. The ponies, which struggled in the water and in the air, appeared to be quite at home in the boats, which soon hoisted sails and went careering away with them. When the mainland was reached the buyers took their ponies out and led them away to be broken, civilized and trained to eat grain and other food utterly strange to them. The ponies on the banks are as wild as the rabbits, which likewise abound there, and they have much instinct, this teaching them to get water by pawing holes in the sand not far from the shore, in which it rises, being filtered by the sand, and they know how to swim fearlessly and far in water reasonably still, and also which are the shallow places in which they can walk, and save the trouble of swimming. Thus in times of storm they sometimes walk and swim to the mainland, three or four miles from their home, this movement being before the elemental outbreak. But at other times instinct appears to somewhat fail them, and though they must have premonition of impending storms, they yet occasionally are caught by phenomenally high tides, which sweep over spots on which they had in previous times found safety. The water rises to their knees, to their bodies, to their eyes, and they then become terror-stricken, and are drowned as, huddled in a mass, they kick and plunge. Thus in August, 1899, in a notable storm, 400 were drowned on knolls which had before been places of safe refuge. The ponies could have gone to other even higher places, which the water never covers.

These ponies, as has been clearly proved, were brought over by the first English colonists to America, and, as stated, came from the coast of the Mediterranean, they being then thought to be harder than the English horses. There are in western North Carolina other ponies, commonly known as Indian ponies, which are of Spanish origin, and which are of entirely different appearance. These ponies are in many cases spotted, this being never the case with the banker ponies. They are under the medium size, plump and graceful. They are so gentle at all times that they are at home in the yards or even the houses of their owners in the Cherokee reservation in Jackson and Swain counties. They are in fact pets from birth, and the Indians have always disliked to sell them. They are becoming very scarce now.

FRED A. OLDS.

If you want to be posted as to the constant changes, and have the latest and correct edition of the *Game Laws in Brief*, you should subscribe for it. Price \$1 per year.

If he has never seen a real "raw log-jam" he should not write about one. A bunch of old tree trunks, water-logged and rotting in a cove of some dead water or bayou, may be "a wonderful study of hues—browns, umbers, faint pinks and purples, dull reds and yellows, silver of lichens and green and crimson of mosses," but it wouldn't be a "raw log-jam" or anything resembling one in the very least.

If Mr. Brown has never heard the click of a well shod canoe-pole, he is no more an authority on the subject of canoe-poles than on that of log-jams.

I am unable to infer from any one of his strictures on Kipling's words that Mr. Brown has any familiarity whatever with camp life or experiences in the wilderness. His assertion that campers do not "sleep on a couch of hemlock twigs if they can get spruce boughs" is the exact reverse of the facts in the case as I have known them. Moreover, the intemperateness of his attack and the amazing violence of his diatribe show him to be as unfamiliar with the calm temper of legitimate criticism as he is with the phenomena which he ventures to discuss. I doubt if anything more monstrous ever appeared in the liberal columns of *FOREST AND STREAM* than the characterization of Kipling's sweet, truthful and most poetic lines as "mere fakir vociferation, squawking of a brood-goose on added eggs, self-conscious mountebank strut and posing, brazen assumption by ignorance of real truth, insight and knowledge, bawling claim to Nature-photography," etc., etc.

And now I wish, Mr. Editor, that you would, if permitted, reprint the whole poem, "The Feet of the Young Men" (just made available again in a new volume, "The Five Nations"), that we may all enjoy it again and realize anew the poet's exquisite accuracy of observation and characterization, and the delicacy as well as strength of his poetic feeling. The third and fourth double quartrains are wonderful, to those who can judge of them, in their contrasted pictures of life in the pile-built villages in the bamboo country and of the stalker of *Ovis poli* over Himalayan snows.

And it is all done with such vigor, each characteristic put before you with one unerring stroke of the brush! Mr. Brown has done his readers one service, though unwittingly. He has reminded them again of the one poem which perhaps more than any other of its length in the English language breathes the true inspiring spirit of *Forest and Stream*. C. H. AMES.

[Copyright restrictions would prevent the publication of the poem.—ED. F. AND S.]

The Mosquito as Game Protector.

THE FLATS, Yukon River, Alaska, Aug. 30.—*Editor Forest and Stream*: One of the magazines, a copy of which recently fell into my hands, contained an article on mosquitoes. The writer of the article appears to be one of those who consume none but filtered water and who at every gulp wonder how many microbes went down with it. That he never slaked his thirst while prone upon the bank of a brook, using the rim of his hat for a chalice, and that he never in his life thanked Him who made the brook for one sparkling drink, is also evident. How else could he find in the mosquito nothing but that which justifies extermination? Such is not the plan of nature even in her smallest works.

The article I have in mind closed with the statement: "Science has found a use for nearly everything in creation, but for what purpose the mosquito has been placed on earth science has, up to the present, been unable to ascertain." If that is true, then do I fail to see the use of science. To me the very fact that the mosquito is, is proof enough that he is here for a good reason. There is but one Creator; all things He makes are good.

Could the scientist who sits in a mosquito-proof cottage in the bogs of the Campagna in the interest of science be induced to spend a season in these northern swamps, he would undoubtedly find that here the mosquito serves a purpose even more praiseworthy than is his occupation in the south of Italy, which appears to be the malariaizing of possible Maffiosi. Could the mother moose, the wild goose, the duck, the snipe, and other fowl be interrogated on the subject of mosquitoes, we would probably find that they worship him.

I speak from personal observation and experience here in the "Flats." Were it not for the swarms of mosquitoes who have guarded this magnificent breeding place of moose and all species of waterfowl as well as rabbits, for ages, then would we thrill at this late date no more at the thought of a hunt in the fall. Down at the mouth of the Yukon I have known the natives to give up an egg-hunt, saying the mosquitoes were too bad. Each one of these hunts, if not spoiled as this was, means thousands of eggs eaten instead of hatched. Here in the upper flats everybody keeps away from the timber and the myriads of lakes from the beginning of June until the latter end of August; camping is possible only in the hills or on the sandbars in the river. The wolves, wolverines, foxes, lynx, and marten, all lovers of raw eggs, and chief of them all the black bear, betake themselves to the mountains, and thus the cradle of the things that make a hunter's life worth living remains undisturbed—thanks to the mosquito. WM. YANERT.

Alligator and Dog.

ST. AUGUSTINE, Sept. 13.—L. O. Davis, who lives on the Pacetti Place, a short distance from St. Augustine, lost a valuable dog yesterday in a very peculiar way. While sitting on his porch he heard the dog howl, and, taking his gun, ran toward Von Balsam Branch, from whence came the sound. Reaching the bank, Mr. Davis saw his dog in the jaws of a large alligator. The saurian was backing toward the branch, when Mr. Davis sent the contents of his gun into the alligator's head, killing it instantly. He then went forward to rescue his dog, but found it dead, the jaws of the alligator having crushed the life out of it. He could not even "prize" the jaws open with a stick.

The alligator measured 7 feet 4 inches. Mr. Davis has lived in the neighborhood for some time, and had no idea such a monster had its home so near. As Mr. Davis's children have been in the habit of playing around the branch, it is probable that they had a narrow escape. The alligator was evidently hungry, and, fortunately, chose the dog instead of the Davis children.—Florida Citizen.

The Pennsylvania Elk.

[From the Mammals of Pennsylvania and New Jersey. By Samuel N. Rhoads. Concluded from page 276.]

The following notes by my valued correspondent, Mr. E. O. Austin, of Potter county, Pa., regarding the habits of the wapiti in that county are of much interest. Under date of March 4, 1901, he writes: "I settled at my present residence, now in the borough of Austin, in 1856, then a perfect wilderness. When I came into this region, a young man, I could not be surfeited with the stories told by old settlers and hunters as to what they had seen. On the First Fork of the Sinnemahoning, near Prouty Run [Potter county], was the 'Great Elk Lick' of this region. About 1835 or 1836 the first settlers came into this region. The elk, with other wild creatures, then reigned here in their glory. Clifford Haskins, Charles Wyckoff, the Jordans and John Glasspy, with others, were among the prominent men of the time. They were all settled within three or four miles of this lick. They all told me that they would go to the elk-lick to get a deer as often as they wanted one in the summer time. Here, sometimes, 50 or more could be seen at a time, with the fawns playing around like young lambs. Clifford Haskins said he went there once to get a deer, when he saw several elk

not far from some rocky ridge or large rock, accessible to the elk. The dog attacks him with a great noise, and not much else. The beast runs for a rock as the best fort of defense from the attack. While his attention is absorbed by the antics of the little dog, it is easy prey to put a rope over his horn with a long pole, or by throwing it noosed, and with two ropes on his horns and two strong men, wide apart, to hold him, he soon becomes tired and docile enough to be led out and home. This was not an unfrequent occurrence in those times."

The following article was published in the New York Times and reproduced in the Pittsburg Post of April 19, 1896:

"When I started in to amuse and profit myself by following the chase in northern Pennsylvania," said Colonel Parker, of Gardeau, Pa., "elks were running in these woods in herds. I have killed elk a-plenty in the Rocky Mountain country and other regions since, but I never ran across any that were as big as those of old-time Pennsylvania elk. I have killed elk on the Sinnemahoning and Pine creek waters, and down on the Clarion River and West Branch, that were as big as horses. A 1,000-pound elk was nothing uncommon in that country, and I killed one once that weighed 1,200 pounds. These were bulls. The cows would weigh anywhere from 600 to 800 pounds.

Pine Creek country [Potter county]. She and the bull and calf had been discovered some time before Sterling Devins ran across the cow, by Leroy Lyman, on Tomer's Run, near the Ole Bull settlement [Abbot township]. Lyman got a shot at the bull, but the whole three escaped. The same party of hunters that captured the cow killed the bull afterward in the woods on Kettle creek. The calf the dogs ran into Stowell's mill pond, and there it was killed.

"A set of elk antlers of five feet spread and weighing from forty to fifty pounds, was not an infrequent trophy. George Rae, who was one of the great hunters of northern Pennsylvania in his day—and he is one of the greatest in the Rocky Mountains, even to this day, in spite of his eighty-five years—lived along the Allegheny at Portville. He had in his house and in his barn, the walls almost covered with the antlers of elk he had killed, on the peak of his roof, at one end, being one that measured nearly six feet between the extremities. When George moved West forty years ago he left the horns on the buildings, and only a few years ago many of them were still there, as reminders of what game once roamed our woods.

"It required more skill to hunt the elk than it did to trail the deer, as they were much more cautious and alert. For all that, an elk, when started from his bed, did not instantly dash away, like the deer, but invari-

ALLEGHENIAN WAPITI OR ELK (*Cervus canadensis*).
From Audubon's Painting of Living Pennsylvania specimens.

in the lick and more in the clearing around it. It being the first time he had seen elk there, he gazed in wonder, when more came in, until 40 or 50 had congregated. He watched their grim play for some time and then shot one. The rest started back, then stamped around their fallen comrade, gazing in a bewildered way, and stampeded with the noise of thunder when Haskins approached. Aunt Eleanor Wyckoff lived a mile and a half from Elk Lick. She told me she thought her brother, Mr. Jordan, was telling one of his big yarns when he told her of a similar view of elks, but one day after, when the men found they were around again, she went with her husband to see them. She said, 'First some came, then more, until the clearing seemed full of them and the men said there were about 50 there.' Regarding the clearing above mentioned—where the elk frequented a big lick, they rubbed their horns against the trees, sometimes in play or to rub off the velvet or skin from the new horns. This process soon kills all the trees, except some big old ones, so that a clearing of 2, 3 or 4 acres is made around the lick. A few thorn trees [*Crataegus*] come up on it, which grow so low and stout as to defy them, when it is called a 'thorn bottom.' The elk are gregarious, living in small herds if unmolested, likely in families, but they congregate at the licks in summer in considerable herds.

"I have no account of their 'yarding' in this county. Their food in summer was nettles [*Laportia*], elk or cow cabbage, elk grass (a wide-bladed bunch-grass common to the woods), and the tender growing twigs of most deciduous trees; and in the winter this elk grass, which keeps green all winter, the edible brake or cow brake [*Pteris aquilina*] or fern, and browse of deciduous trees. They migrate in families from section to section of the country, much like deer, but farther away.

"John Glasspy told me of taking a contract to catch elk alive for some fancier. They find and single out their elk, when two men with a small dog, and each a coil of rope and well-filled knapsack of grub, start on the chase, and a long chase it is. But after three or four days the creature halts to see what is following him. Then they let loose the little dog. The elk seems to wonder if he has been frightened by that little whiffet. The men have chosen their time and place

"The Pennsylvania elk's eyes were small, but sparkled like jewels. I have often seen a score or more pairs of these bright eyes shining in the dark recesses of the pine forest, when the shadows might have otherwise obscured the presence there of the owners of those telltale orbs. An infuriated bull elk's eye was about as fearful a thing to look at as anything well imaginable, but so quickly changeable was the nature of these huge beasts that two hours after having captured with ropes, one that had, from the vantage ground of his rock, gored and trampled the life out of a half dozen of dogs, and wellnigh overcome the attacking hunters, submitted to being harnessed to an improvised sled and unresistingly hauled a load of venison upon it six miles through the woods to my cabin, and took its place among the cattle with as docile an air as if it had been born and brought up among them.

"The elk that Sterling Devins had mistaken for a mule, he and Ezra Prichard followed all the next day, but lost its trail. Some Pine Creek hunters got on its trail, drove it to its rock and roped it. When Devins and Prichard got back at night they found the Pine Creek hunters there and the elk in the barn eating hay and entirely at home. That elk had quite an interesting subsequent history. Ezra Prichard had, previous to the capture of this one, secured a pair of elks, broke them, and for a long time drove them to farm work like a yoke of oxen. Sterling Devins was eager for a yoke of elk, and he offered the Pine Creek hunters \$100 for the one they had captured. They refused the offer, but afterwards got into a dispute about its ownership, and it was sold to Bill Stowell and John Sloanmaker, of Jersey Shore. These men took the elk about the country, exhibiting it, and made quite a sum of money. Next fall, although the elk was a cow, it became very ugly and attacked its keeper, nearly killing him before he could get away. No one could go near her, and her owners ordered her shot. The carcass was bought by a man who had a fine pair of elk horns. He was a skilled taxidermist, and he managed to fasten the horns to the head of the cow elk in such a manner that no one was ever able to tell that they hadn't grown there. This made of the head an apparently magnificent head of a bull elk, and it was purchased for \$100 on that belief, by a future governor of Pennsylvania.

"That cow elk was one of the last family of elk in the

ably looked to see what had aroused him. Then, if he thought the cause boded him no good, away he went, not leaping over the brush, like the deer, but, with his head thrown back, and his great horns almost covering his body, plunging through the thickets, his big hoofs clattering together like castanets as he went. The elk did not go at a galloping gait, but traveled at a swinging trot that carried him along at amazing speed. He never stopped until he had crossed water, when his instinct seemed to tell him that the scent of his trail was broken before the pursuing dogs.

"At the rutting season the elk, both male and female, were fearless and fierce, and it behooved the hunter to be watchful. An elk surprised at this season did not wait for any overt act on the part of an enemy, but was instantly aggressive. One blow from an elk's foot would kill a wolf or a dog, and I have more than once been forced to elude an elk by running around trees, jumping from one to another before the bulky beast, unable to make the turns quick enough, could recover himself and follow me too closely to prevent it, thus making my way by degrees to a safe refuge. I was once treed by a bull elk not half a mile from home and kept there from noon until night began to fall. I haven't the least doubt but he would have kept me there all night if another bull hadn't bugled a challenge from a neighboring hill and my bull hurried away in answer to it.

"The whistle of the bull elk, as the hunters call it, wasn't a whistle, although there were changes in it that gave it something of a flute-like sound. The sound was more like the notes of a bugle. In making it the bull threw back his head, swelled his throat and neck to enormous size, and with that as a bellows he blew from his open mouth the sound that made at once his challenge or call for a mate. The sound was far-reaching, and heard at a distance was weird and uncanny, yet not unmusical. Nearby, it was rasping and harsh, with the whistling notes prominent.

"The Pennsylvania elk was never much scattered. When I first came to the Sinnemahoning country, nearly seventy years ago, the salt marsh that lay in the wilderness where my residence now is [Gardeau, in the extreme southeast corner of McKean county, almost on Potter county line], was trampled over by herds of elk and deer that came there to lick the salt

from the grounds as if a drove of cattle had been there. I have seen seventy-five elk huddled at that marsh. That was the 'Big Elk Lick' of legend which the reservation [Cornplanter], Indians had often talked to me about when I lived in Allegheny county, New York, as a boy, and it was to find that lick that my father and I, following the rather indefinite directions of one Johnnyhocks, an old Shongo Indian, entered the Pennsylvania wilderness in 1826. The marsh is now the site of a big hotel, it having been found that the depth of the swamp concealed waters [Parker's Springs] of rare medical value.

"To follow an elk forty miles before running it down was considered nothing remarkable. I have done it many a time, Leroy Lyman, Jack Lyman and A. H. Goodsell once started on an elk hunt from Roulette, Potter county, struck the trail at the head of West creek in McKean county, thirty miles from Roulette, followed it through Elk, Clarion and Clearfield counties, and finally drove it to its rock eighty or ninety miles from where the trail was first struck. They had followed the elk many days, and finally the quarry was found, an enormous bull with a spread of horns like a young maple tree. The horns were the only trophy that the hunters got from the long and tedious chase [meat being unfit to eat], and that trophy was well worth it. It was the largest and next to the finest pair of antlers ever carried by an elk in the Pennsylvania forests, so far as there is any record.

"There are scattered through the woods, generally high on the hills, from the Allegheny River down to the West Branch and Clarion River, huge rocks, some detached boulders and other projections of ledges. These are known as elk rocks, and every one of them has been, in its day, the last resort of some elk, when it had in vain sought to throw the hunter and hound from the trail to make its stand at one of these rocks. Mounting it, and facing its foes, it fiercely fought off the assaults of the dogs by blows of his fore feet or tremendous kicks from its hind feet, until the hunter came up and ended the fight with his rifle. It would be strange if one or more of the dogs were not stretched dead at the foot of the rock by the time the hunter arrived on the scene. I have more than once found dead wolves lying about one of these elk rocks, telling mutely, but eloquently, the tragic story of the pursuit of the elk by the wolves, his coming to bay on the rock, the battle and the elk's victory. The elk was not always victor, though, in such battles with wolves, and I have frequently found the stripped skeleton of one lying among the skeletons of wolves he had killed before being himself vanquished by their savage and hungry fellows.

"In the winter time the elks would gather in large herds and their range would be exceedingly limited. Sometimes they would migrate to other regions, and would not be seen for months in their haunts, but suddenly they would return and be as plentiful as ever. They had their regular paths or runways, through the woods, and these invariably led to salt licks, of which there were many natural ones in northern Pennsylvania. One of the most frequented of these elk paths started in a dense forest, where the town of Ridgway, the county seat of Elk county, now stands, led to the great lick on the Sinnemahoning portage, and thence through the forest to another big lick, which to-day is covered by Washington Park, in the city of Bradford [McKean county]. I have followed that elk path its whole length, when the only sign of civilization was now and then a hunter's cabin, from the headwaters of the Clarion River to the Allegheny, in McKean county. Hundreds of elk were killed annually at the licks or while traveling to and from them, along their well-marked runways.

"The biggest set of elk antlers ever captured in the Pennsylvania woods was secured in the Kettle Creek country by Major Isaac Lyman, Philip Tome, George Ayres, L. D. Spoffard and William Wattles. Philip Tome was a great hunter, and the famous interpreter for Cornplanter and Blacksnake, the great Indian chiefs. He came over from Warren county to help Major Lyman capture an elk alive, and the party started in on the first snow, with plenty of ropes and things. They camped, but the elk were in such big herds that they couldn't get a chance at a single bull for more than a week. Then they got the biggest one they ever saw and gave chase to him. They started him from his bed on Yocum hill. The dogs took him down Little Kettle creek to Big Kettle, and up that two or three miles. There the elk came to bay on a rock. He kept the dogs at a distance until the hunters came up, when he left the rock and started away again. Tome, knowing the nature of elk, said that all they had to do was to wait and the elk would return to the rock. They dropped poles and fitted up nooses. They waited nearly half a day, and then they heard the bull coming, crashing through the woods, down the mountain sides, the dogs in full cry. He mounted his rock again. The hunters he did not seem to mind, but the dogs he fought fiercely. While he was doing that the hunters got the nooses over his immense horns and anchored him to surrounding trees. They got the elk alive to the Allegheny River, and floated him on a raft to Olean Point. From there they traveled with him through New York State to Albany, exhibiting him with much profit, and at Albany he was sold for \$500. That elk stood sixteen hands high and had antlers six feet long, and eleven points on each side, the usual number of points being nine on a side.

"The last elk in Pennsylvania is supposed to have been killed in the winter of 1867, by an Indian named Jim Jacobs, from the Cattaraugus Reservation. Jacobs followed the elk from Flagg Swamp, in Elk county, to the wilds of Clarion county, through a hard snow-storm, where it came to bay on a rock, and the Indian shot it. It was a bull elk and none had been seen or heard in the region for several years before that."

I wrote Mr. E. O. Austin, of Austin, Potter county, distant seven miles from Gardeau, as to his view of the narrative of Capt. Parker above quoted. He writes me that he knew Parker, Lyman, Pritchard, and others named, nearly all of whom, including Parker, are now dead. Sterling Devins still lives in Homer township, Potter county. They all told substantially the same

stories of elk habits as given by Parker, who was an old veteran, not only in age, and hunting exploits, but in his latter days as a story teller. Mr. Austin writes: "What Col. Parker says of the habits of elk and other wild animals is very correct, but he was in the habit of making a good story of his exploits." A failing, I might add, which is common to so many "great, old men," that the world knows how to make allowance for it.—Rhoads, 1902.

Grouse Self Killings.

RIDGWAY, Pa., Oct. 4.—*Editor Forest and Stream:* A rather singular action on the part of grouse in Potter county was called to my attention on a visit to Coudersport, Pa., county seat of that county, last week.

Four years ago a new brick building was erected on the main street of the town on the west side. The building has two stories in it, with large plate glass fronts on one side. The first year the glass was put in, in the fall, a grouse was picked up dead inside the store, having gone through the glass in full flight in the morning.

The glass was renewed, and the next year another grouse went through it. The window was patched up, and last fall another unfortunate grouse went through the patched up window. Tired of buying plate glass windows for the birds to break, the owner had a wire screen put over the upper half, and this season recently a dead grouse was picked up on the street, having been killed by flying into the screen.

The only explanation of this is offered in this way. The east side of the street, opposite the store, has large shade trees, and if the sun is shining in the morning the trees are reflected in the glass, which deceives the birds into believing they are about to fly through trees in place of plate glass.

E. H. KNISKERN.

[The case cited is very interesting, but not unexampled, especially at this time of the year. All sportsmen know that during the middle fall—and especially during the month of October—grouse, and also quail, wander about and are frequently found in situations which seem absolutely unsuited for them. We have seen ruffed grouse in the branches of the trees on the main street of a New England village, and very recently Mr. Emerson Carney has called attention to a flock of quail in town. Moreover, during late September and October, it is not at all uncommon for ruffed grouse to kill themselves by flying against houses, and in at least one case that came under our own observation, a grouse flew against a window and was killed. At two houses on a single farm in Connecticut, three grouse have been killed in this way within the last twenty-five years. In two of the cases, the birds flew against the side of a red brick house; in the other, the house was wooden and painted a light color. These cases of self-killing undoubtedly have some relation to the wandering spirit which seems to attack the grouse at this season of the year, and there are many sportsmen who declare that at this time grouse are foolish or crazy. The case cited by our correspondent may possibly be explained as he suggests, by the reflection from the glass. At all events, the case is an interesting one, and we should be glad to hear of its parallel, if one exists. Since these lines were written a case has come to our notice of a grouse flying against a light wire netting topping a fence about a poultry yard. The bird was found dead near the fence.]

Forestry at St. Louis.

THE United States Government, contrary to all precedent, will participate in a competitive exhibit at the World's Fair in St. Louis. Uncle Sam will have for his rival the German Empire. Which nation's methods of forest management is best and most practical is the problem to be solved by actual demonstration.

Two tracts of land, already partially covered with trees, and each about five acres in extent, have been assigned to the United States and German Governments as the laboratory for their tests. The two lie side by side, so that the visitor may walk through what the Americans call an "arboritum" and observe all American methods of forestry, and then step across into what the German designates as a "forest garden" and learn the German method.

No trees will be cut from either tract. Rather transplanting will be resorted to, and when the Exposition opens miniature forests, perfect in every detail, with narrow gravel walks winding in and out, may be seen. Every tree that thrives in the latitude of St. Louis will be represented and the specimen can be easily designated. Attached to each tree will be an aluminum label on which will be stamped the botanical and common names.

In one respect the exhibits will be the same. Each display will embrace practically the same number of trees and they will be practically of the same varieties. Here all similarity ceases. The treatment will accord with the practices in vogue in the respective countries. In the American arboritum the trees will be planted, trained, and pruned and treated according to the American idea. In the German forest garden will be reproduced, in the miniature, the effects that obtain in the forests of the Fatherland, and the story of how the wonderful forests of that wonderful country have been preserved through ages, and renewed from time to time, will be told by practical demonstrations.

The exhibits will be in charge of the most expert foresters to be found in the two countries. Interest will not center in the exhibits merely because they represent all that is best in the forestry of both countries, but because of the practical demonstrations and tests that will be made every day of the Exposition. Trees will be transplanted and the most approved apparatus for this work will be shown in actual operation. Trees will be pruned and trained, and all of the implements used will be a part of the exhibit. Trees will be inoculated with disease, and when the disease is fully developed the most approved treatment will be accorded the affected trees. Careful data will be kept on all such experiments, and the results will be made known, together with a full description of the treatment, in order that the preservation of the forests may be accomplished

Forests probably have more deadly foes in the insect world than they have in the ax of the woodman, and far more difficult to circumvent. This will afford an exhibit of exceptional interest. Collections of the insect enemies to trees will be gathered and kept carefully isolated. On occasions best adapted to experiments that will reveal all of the effects of the destroying powers of the insect, and the efficacy of the treatment to be given, the insects will be released and permitted to attack the trees. Then sprays, washes, and other treatments will be resorted to. Some valuable experiment will be made every day, and full details may be had of the processes and results.

"Of the Kind Known as the Squirrel Hawk."

WORCESTER, Mass., Oct. 12.—*Editor Forest and Stream:* I was just a bit amused on reading C. G. B.'s contribution in last week's issue relative to "Duck Shooting Extraordinary" taken from the New York Sun.

From yesterday's issue (Sunday, Oct. 11), of the Boston Globe I cut the inclosed paragraph, also taken from the New York Sun:

The park authorities have been at a loss to account for the number of dead squirrels in Central Park lately. Yesterday afternoon Keeper Billy Snyder was near the sheepfold when a number of nurses came up to him and said that a "big eagle" had been flying around and alighting near the children, as though it meant to carry them off.

Snyder got a shotgun and pretty soon discovered the "big eagle." It proved to be a hawk of enormous size. When Snyder found him he was perched on the top of a tree eating a gray squirrel.

Snyder filled his gun with buckshot, and at the first shot brought down Mr. Hawk. The bird, Snyder says, weighed 50 pounds, and was of the kind known as the squirrel hawk. It is believed that he had flown over from the woods in New Jersey. Snyder said he would have him stuffed as a trophy.—New York Sun.

If you think it worth the space, will you kindly reproduce it, to the end that sportsmen and naturalists may know that there are some pretty large hawks abroad outside of Wall street.

J. W. B.

[A typographical error or a reporter's imagination is responsible for the story. No North American bird weighs 50 pounds.]

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

American Game Birds.

I.—Woodcock Shooting.

Of all the kinds of shooting of field and forest, the sport of woodcock shooting holds the warmest place in the hearts of its devotees. The woodcock shooter is an enthusiast of enthusiasts. He may take a keen pleasure in bringing other game birds to bag, but when woodcock shooting is under consideration comparison ceases. And indeed this sport possesses many fascinating features peculiar to itself. First of all, it can at best be indulged in but in very small quantities. There is but little of it when compared to the abundance of other kinds of shooting, for the woodcock is comparatively a rare bird, and its season is a short one, therefore the keen edge of enjoyment of woodcock shooting is never dulled by surfeit. The habitat of the bird is distinctly different from the habitat of all other game birds, and of the vast tract of land which makes the earth's surface there are but tiny spots here and there which meet the wants of its nature, and many vast tracts of fertile country have no woodcock ground at all.

It, too, is a bird of mystery, of whose coming and going no one knows. It is nocturnal in its habits, and its haunts being such secluded and unused spots, ones rarely invaded by man, it is rarely seen. The residents of sections wherein is the home of the woodcock may never see one from year's end to year's end, and, indeed, may go through life with no more knowledge of them than that derived from hearsay, or, seeing one, may still remain in ignorance of its identity. While the quail, the partridge, the snipe and other game birds are not unfamiliar to country residents and are readily identified by them, that of the woodcock and its doings are shrouded in mystery. The large woodpecker in some sections is called woodcock by the country folk, while in other sections any plover with a long bill is classified as being the same bird. So little is the bird known that sometimes when killed it is called snipe and sometimes the snipe is called woodcock by those who have not given the bird special study or attention. Its life being so entirely without the sight of man and in general so little being known of its haunts and habits, it is not at all strange that the little accurate knowledge is obscured by the air of much mystery, and that those who seek the bird find a fascination in it greater than that of any other form of game bird shooting. The bird itself is of peculiar form and of rare richness in its colorings, and its flesh is esteemed a morsel of rare excellence, fit for the palate of the most fastidious epicure. Thus it affords great sport in its capture and is pleasing to the eye and palate.

Its habitat is generally in densely shaded nooks in out-of-the-way places, where man rarely enters, and where the soil is soft and moist, for in such places is its food obtained. The alder ruins, and slopes in the birches, and nooks in the woods where springs or rivulets or excess of moisture makes the ground soft, are its favorite haunts, and sometimes in certain sections it finds spots in the cornfields which are desirable feeding grounds, though haunts and feeding grounds are never plentiful. In Mississippi it is occasionally found in open sedge fields. Many places, which to the eye have every appearance of home for it, still have no birds in them.

The scarcity of the bird, its beauty and the delicate flavor of its flesh, all serve to enhance its value, and its mystic life adds a charm to its pursuit which is distinct from all others.

The difficulties of woodcock shooting have been greatly exaggerated in every particular, particularly as concerns the extraordinary skill required by the shooter, and the still more extraordinary labor and consequent fatigue imposed on the dogs, the latter being an indispensable factor in the sport, if any success worth considering is sought. While intrinsically the sport possesses all the requirements of the highest degree of wing shooting, the writers on it have deemed it fitting that it be dressed in a glamour of romance, presumably that a little knowledge might be presented in an elaboration of high colors which touched on the sky, the sunshine as it glinted through the alders, the beautiful color of the foliage, the balmy zephyrs laden with nature's perfumes, *ad infinitum*, all of which are present in all other kinds of shooting, or, indeed, present if there is no shooting at all. The shooting of woodcock is difficult, it is true, but not so extraordinary in its difficulty as to be distinctly special, and far from being so difficult as most shooters make it from injudicious selections of guns, loads, etc.

Woodcock shooting is close shooting, the closest of any kind of shooting recognized as legitimate sport with the shotgun. While the woodcock is called a game bird, it is gentle and mild in its habits, with none of the pugnacity or extraordinary vitality possessed by members of the grouse family. The smallest of shot is sufficiently heavy to kill it, and the cylinder-bore gun is amply close enough for the ranges which one must accept in shooting it. The choke-bore of any kind is out of place in such extremely short ranges, and unfit to use on a bird so easily killed, though, strange to say, the use of it is not uncommon, owing, no doubt, to the fact that many men owning but one gun, must use it for all kinds of shooting, and in other instances to the further fact of thoughtlessness concerning the proper requirements of the sport. Short barrels, too, are desirable, the difference in the handling of a 30-inch barrel and a 24-inch barrel in cover being far away in favor of the latter.

Woodcock shooting is largely a matter of snap shooting; therefore, a wider pattern at a much shorter distance is a requisite if one is cultivating success instead of nursing a fad in respect to the use of choke-bore guns for all kinds of shooting, whether the guns be fitting or otherwise. In the shooting of quail, or chickens, or ruffed grouse—to a lesser degree with the latter—a certain degree of deliberation and quick aim can be practiced, but in woodcock shooting the opportunities for deliberation are the rare exception; hence the need of adopting an open gun to meet the requirements of quicker work and short ranges. Light loads and smaller shot can be used successfully, some noted shooters using dust shot exclusively. With a short, cylinder-bore gun—a true cylinder-bore, not the modified choke-bores, which are often called cylinder—such a pattern can be secured at 15 or 20 yards as will insure fair success to the average shot and the best of success to the good one. It might be said that such a gun and load are too murderous, and, indeed, they would be in the hands of a man who could shoot with any degree of precision if he could exercise deliberation, but as in the greater number of instances the shooter has but an instant in which to act, the results are far from being so fatal as one might fancy them to be. Often there is but a momentary glimpse of a dusky shadow flitting through or across a small vista in the dense growth, and the shooter must fire then or not at all, unless he is pleased at a purposeless tumult, that being the sum total when he shoots and trusts to luck for the execution of his purposes.

As in all other shooting, experience enables the sportsman to recognize the promising nooks for woodcock, and the signs which denote its presence, they being the holes made by it in boring in the ground for its food and other signs well known to the shooter, and which can only be recognized by experience.

As to the labor and fatigue imposed on the dog while seeking for woodcock, they are largely an exaggeration. Wilson, in his work on the birds of North America, specifically mentions the fatiguing efforts which the dog encounters in woodcock shooting, and mentions that relays of dogs are necessary. As a matter

of fact, the work of the dog in woodcock shooting is the easiest of all kinds of shooting. He must range close to the shooter, or at most not beyond a gun shot if he serve the best purpose in that kind of shooting, and it is not at all essential or desirable that he work at high speed. It is essential, however, that he be intelligent and know thoroughly the best manner of working to the gun and assisting the shooter to get his shots in the manner to insure success. He should work diligently, but not hurriedly, and it is hardly necessary to add that the work should be done as silently as possible, though this also is true of all other kinds of shooting.

The dog should be a good retriever, otherwise a large percentage of the birds will be lost, for many times it is as difficult to find the bird after it is killed as it is before. Dogs which run riot in this shooting can soon tire themselves out, particularly in summer shooting, when dogs are out of condition and the weather warm, the consequent fatigue from such over-exertion and unfit condition cannot be justly attributed to the difficulty of the sport. It is rather hard work for the shooter, particularly he of the North, where the quest must be made afoot and where the footing is difficult and insecure, though after all it is but little more difficult than any other shooting in which the shooter walks.

As the dog often comes to a point in thick cover out of sight of the shooter, even though the point may be but a few steps away from him, a bell attached to the dog's collar has been found of great assistance in determining his whereabouts, and its silence indicates when he stops on point, matters very essential in conducting the sport. Not every dog is a good woodcock dog; even though he may be excellent on quail, snipe, chickens, etc. Some dogs appear to dislike the work intensely, others refuse to recognize the bird at all. A few take to it very kindly and work to the gun from observation to a useful degree far above what could be established by the most careful training. The spaniel is but little used in the United States for woodcock shooting or any other shooting, for that matter, though there is no doubt but what they could be made eminently useful in field sport.

In Louisiana and other sections of the South, where the woodcock seek a clime more genial than that of a Northern winter, the conditions of shooting change almost entirely. In sections at certain times, generally in the last of December and the fore part of January, they may be found in great numbers, and a bag of twenty, thirty or forty in a day is not then considered remarkable. They frequent the switch cane bottoms, or woods in the timbered prairie in which the heavy fall rains have softened the ground and where abundance of food can be found. Their stay in the South is very short, they starting North immediately on the lessening of the winter cold, probably after a stay of about two or three or four weeks, their coming and going then being quite as silent and secret as in the North. They are there killed in great numbers both day and night by market shooters, and shipped to the home and distant markets. They have their choice feeding grounds even in that land of abundance, and skill, diligent effort and knowledge of habitat is quite as essential to success in the Southern winter shooting as it is in the less bountiful shooting of the North in summer and fall.

B. WATERS.

A Bear Hunt.

Editor Forest and Stream:

I got this bear hunt at second hand; that is, I did not hunt the bear myself or see him hunted, but from what I know of the country where he was hunted and the hunters who found the bear, or rather whom the bear found, I have no doubt that I have the story straight. The man who sent it to me did not expect it to appear in print (and it may not appear, either).

The man and his boy who did the hunting—that part of it which the bear left for them to do—are glass workers, the man being a superintendent in a glass works in a small town above Pittsburg, while his boy Ed, who is fifteen years old, works in the factory under his father.

The glass works all close down through the hottest part of the summer, generally about the last of June, and do not begin the next "fire" until the middle of September or later. The men make good wages when they do work, and a good many of them put in their vacation in camps, where they manage to spend a part of this money. Beer seems to be the most expensive item in the list of supplies in some, but not all the camps. I remember one where a regular bar was kept with a keg of beer on tap free to everyone who wanted it, whether he was a member of the club or not.

There are several of these camps here in Lake Erie every summer, and some clubs go over to Canada to find a camp. Ed and his father—I put Ed first because he generally puts himself first wherever he is—were members of a club that had a camp near Erie a year ago this summer, but they did not like this place, and I told them that if I were hunting a camp out from Pittsburg I would not come so far as this to find it, while I had the whole of the Allegheny River to camp on. I had traveled more than they had and had seen a good many rivers, but the Allegheny would suit me well enough for a month or two to start with. If I wanted to make a year's camp of it then I might try the upper Missouri

now since the Indians up there have got to be good Indians. They were not any too good when I knew them. I had explored the Allegheny as far as Warren when a boy, and told them of a number of places on it where a camp could be made that would at least suit me.

Ed had been trying to get the "old man," as he called him when the old man did not happen to be within ear-shot, to go to Canada next year. No, I told them, leave Canada to the Canucks; that is, for the present; we may want to annex it some day; these Canadians seem to think that we want it now, but we don't; but I would not go as far as Canada to find a camp even if they gave me the ground I camped on and threw in the whole county besides. Go up the Allegheny next year and try it. "I'll do it," the "old man" said to me, and he did.

Ed had been greatly interested in bears and Indians. I filled him up with stories of both. I had hunted both and had had the Indians hunt me several times as well. I do not know whether the bear ever hunted me or not; the first one I ever came in contact with seemed to have been hunting me much in the same manner as Ed's bear hunted him. I have never been able since to decide exactly whether I found that one or he found me. I do know, though, that he would have lived longer had we not found each other.

I told them that when they were ready to camp this year to go by rail about as far up as Kittanning; then buy or hire a skiff (Ed proposed to steal one, but I warned him not to try it up there); then they could keep on up the river until they found a place to suit them, then camp, and when tired of this place go on again; they would have both banks of the river clear up to Warren to camp on.

"Ed wants bears and Indians; he can find both up there; the bears, what are left of them, are still wild; the Indians are supposed to be civilized now. Those of them that I have met are civilized. They can drink whisky, eat gingerbread, chew tobacco, and swear in English. What more is necessary?"

I made them promise to send me an account of their camp, telling Ed to write it; but when I had got it I found that the "old man" had written it and not Ed. There are no doubt more of fact and less of imagination in the account since it did come from the old man. Ed would probably have killed his bear with the stock of his gun; then, after he had closed in on him, would have killed him some more with a butcher knife. That is the way the bear was generally killed in the valuable works that Ed carried in his traveling library. Those volumes had given him all the information he had ever got about bears, Indians, and the Rocky Mountains until he met me; and some of the tales that I gave him were patterned after the ones he found in these boys' stories. He had asked me what would be the best gun to hunt the bear with, and I told him he did not need any; that if I were hunting him, knowing him as well as I do now, I would use a baseball bat on him.

They left home on the 8th of July, taking their camp outfit, arms and fishing rods, and went to Kittanning. Here they bought a skiff and such supplies as could not be got at every place on the river, and then started up the river to hunt a camp, rowing the skiff. There is not much current in the river except at a flood stage, but had I been going up it I should have used a sail; it would have saved a good deal of rowing.

They only went about ten miles the first day, and camped at Peart's Eddy, a shallow place in the river which we had to wade and drag our boat when I made the trip nearly fifty years ago; but they found plenty of water here on the bar and crossed without any trouble. Next day keeping on they got across Gray's Eddy, a few miles below Red Bank, then going a mile or two further made the next camp. A creek came in here on the right hand side and they turned up it but had only got up a few hundred yards when a rapid stopped them and the water above was not deep enough to float the skiff.

They landed and when Ed was looking for a pole long enough to use as a ridge pole for the tent, he found an old cabin a few yards back from the creek, and after examining it they concluded to use it, and if this country suited them make their home camp here. Ed thought that this country would not suit him, they had not got far enough up it yet to meet any bears, and the Indians were still away above this also. The old cabin, not used lately, had been built by a charcoal burner, they were afterwards told. It still had a good roof made of clapboards, a stick chimney (one made of small logs and mud), and a door, but no window. The door of slabs still hung on wooden hinges, and two small bunks of slabs were the only furniture. They have preempted the cabin, he tells me, and mean to use it next year again, for the country did suit Ed after all.

After getting their stuff into the cabin and eating dinner, Ed was about to start to hunt up that bear right away, but his father told him that they had better first hunt up any neighbors there might be here and find out whether they were intruding or not, and make arrangements to get their bread and farm produce. They would not have to go many miles above here to find a store. Red Bank is at the lower end of Clarion county, and this country back here in Clarion and Armstrong counties is still much of it a wilderness. It is more or less a broken country with low hills, and is not thickly settled. Ed would be as likely to find his bear here as he would be to find him anywhere on the river.

They found a farmhouse about a mile above the cabin near the head of the creek, and got all the information they wanted about the country, besides getting milk and vegetables here. Ed asked about the prospect of finding a bear. "You are right in the middle of the bear country now," the farmer told him. "I have a bear here that I don't need. You may have him. Come and I will show you where you are likely to find him if you watch for him long enough. I have not time to do it or I would watch for him with an ax."

He took them back to a cornfield adjoining a strip of timber. The timber he told them ran back here for several miles, and there were bear's tracks plain enough. The bear was in the habit of coming down through this timber and getting in through the fence to the corn. "I can't keep him out of it," the farmer told Ed. "If he can't get through the fence he climbs over it. He generally comes late in the evening or after night. If he only took what he eats, he might have it, but he destroys ten times as much as he eats."

The corn stalks were all broken down next to the fence for nearly the whole length of the field. The corn was hardly ripe enough for roasting ears yet, but it was just right for him, the farmer said.

"I had a sow and eight young pigs this spring," he added. "I have the sow and three of the pigs yet; but if I had not missed the others and then taken the sow and what was left of her family out of this timber, I would not have either sow nor pigs now. That bear even followed her down to the barnyard after more pigs. The dogs got after him then and he never came back."

"Why, will he eat pigs?" Ed asked.

"He would rather eat honey if he could get it; but if there is anything he won't eat I don't know what it is."

"I'll get you that bear," Ed assured him. "I am going to hunt him until I do get him."

Ed put in the next forenoon up in this timber watching the cornfield; but the bear did not call; nor had he been there the night before. He may have been hanging around when they were talking about him and heard of Ed's intention to get him. The boy had taken his .44 Winchester to hunt the bear, and at dinner time the farmer sent his boy to bring Ed down to his dinner. Then going home Ed exchanged his rifle for his shotgun, a boy's 16 gauge gun, but a good one; I had used it the year before. Going back into the timber he put in the afternoon hunting for squirrels, but found none. The game warden is not very busy up there or it would not pay Ed to find many just then. He started home about an hour before sunset, and had got to within 200 yards of the cabin, when, hearing a noise behind him, he looked back and found the bear.

There was here a large clump of blackberry bushes that grew close together, and when passing them Ed had gone around them. The bear had been in among them and probably hearing that Ed wanted him was coming now. He may have been in there all the afternoon getting the blackberries, and that was why he did not want any corn. If there was a wild plum or a berry patch in the country, that is just where the bear could be found; I had forgot to tell Ed so.

Ed said that the bear seemed to want to come down and play with him; he was lumbering along after Ed and was not over forty yards away. Ed turning around gave him both barrels; then made a dash for the cabin. If he hit the bear, and he most likely did, his gun was good for at least 70 yards, he would only sting with that bird shot. It was lucky that he did not have far to go to get home; the bear would not do any playing with him now. Ed dashed into the cabin, and, throwing down his shotgun, grabbed up his rifle.

"What is after you now?" his father wanted to know.

"The bear, sir. He chased me clear to the cabin; that is, he did if I have not shot him. I did not stop to see."

"I guess you did not shoot him with a shotgun," his father said, and taking up his own rifle he and Ed started to hunt the bear some more.

The animal was not in sight from the cabin. Going to where Ed had seen him last, they did not find him. He had not followed Ed after getting the dose of shot, but had turned back; the tracks led into the bushes he had come out of. Ed was about to plunge in after him, but his father stopped him. "If you hit him with any of that shot, and I don't see how you could have missed him, you want to see just where that bear is now before you step on him. It might be safe to hunt him with a ball bat when he is in a good humor; he is not in one now. A good deal of that information you were given by Mr. B. about hunting bears with baseball bats was meant for boys only; if he were here hunting that bear now he would take a gun himself to do the hunting with."

They kept around the outside of the bushes, and got to the further side without seeing the bear, then found that he had not stopped there at all, but had gone on home. Ed looked for blood, but found none.

"You won't find any," his father said; "your shot, if he got any of it, only made him angry; it would not hurt him unless he got it in his eyes, and he did not. This trail is going straight enough. When you next find him you will need a rifle; he won't trot along behind you like a dog next time."

It was nearly dark now, and the bear would have to be let go until to-morrow. Ed got a piece of brush and stuck it in the ground where they had stopped following the trail; he did not want to lose any time in picking up this trail to-morrow.

Ed and his father slept in the small bunks in the cabin; one was on each side, half way between the door and fireplace. The door was fastened at night on the inside by a pin pushed in to an auger hole in the end of one of the logs. Some time in the night Ed heard from his bear again. This time the bear had come to the door, and finding that they had him locked out, was pushing and clawing away on the outside. Ed went to the door, and, after listening a while, shook his father and told him that the bear was there again. It was dark in the cabin, and outside as well; there was no moon. They could hear the bear still scratching somewhere, but he was not at the door. Ed felt around until he had found his and his father's rifles; then the pin was taken out quietly and the door opened a part of the way while Ed stood ready to shoot; but there was no sign of a bear there now. They opened the door altogether then, and now the bear (it was too dark to see whether it was a bear or a cow) or what looked like Ed's bear was out at a place where some bread crusts, fish heads and kitchen slops had been thrown on the ground; he was pawing them around.

Ed fired, and the bear was off before he could give him a second shot.

"I think I hit him," he said.

"Yes, and if you keep on hitting him twice a day until we start for home in a month from now you may get your bear after all."

"Why, don't you think he was out there now?"

"Oh, I know he was; but you did not come within a mile of him, shooting the way you did. Why did you not take your time to it, or else let me shoot him? You have only scared him off again; the report of your gun was what sent him off."

At daylight next morning Ed hurried out to the slop pile. "Come out here, father," he called out, "and see if I did not come within a mile of him. He has left a trail of blood here, if I did not."

There were several spots of blood and they followed to where the bear had lain down and there was more blood.

After breakfast they took up the trail, which led to the cornfield and past the corner of it; he had not stopped there to-day.

The ground so far had been soft and the trail plain, but now it led into timber, and here the only trail to be seen was of small spots of blood every once in a while. After following these for over a mile, they began to climb a small hill, having a ravine on the left; and Ed was half way up the hill while his father was still near the foot, when Ed saw the bear again. Down in the bottom of the ravine a fallen tree lay with its roots up hill, and just as Ed had got opposite the tree the bear stuck his head up from behind the trunk near the roots. This was where he lived when at home, as they found out after the bear had ceased to live anywhere. Had he kept his head down he might have escaped again, as Ed was not going down there at all, and for some time they had been going it blind; they could not find even blood spots up here.

Ed dropped on one knee, then began shooting, and the bear now tried to climb up on the log to make a better mark for him probably; but every time he tried to climb the log he would slip back again.

Before Mr. — had got up to where he could fire, Ed's magazine was about empty; it held eleven cartridges, and after his father had given the order to cease firing only one remained in it, and that one would not have been in it a moment later if he had not been told to quit firing.

The bear lay across the log, and was about as near dead now as he ever would be until he was cut up. He looked to be two or three years old and would weigh about 350 pounds they thought; he was not very fat, but was just right, the farmer said, after he had come to get him. Ed's first shot, the one he had fired through the door in the night, had gone through the neck near the shoulder, going clear through; he had not quite made a sieve of him to-day, but had put five balls in him as he lay on the log there, one of the balls going into his head.

"I aimed all of them at his head," he said, "and if I fired ten times, and I must have fired that often, where are the other five?"

"In that log, I guess, the most of them," explained his father. "But you have done very well. I could not do better myself. Only I would not keep blazing away after the bear was dead. That shot you put in his head was all he needed."

Ed went over to the farm. The farmer put saddles on two horses and they rode them over and brought in the bear, leaving the most of it with the farmer to pay him for the pigs and corn the bear had eaten, Ed said.

"We are square now," said the farmer. "I would as soon have him to eat as the pigs." Ed claimed the skin, and since then has had it tanned.

They put in the whole six weeks here, not going any higher up the river. The cabin made a first rate camp, and they did not want to leave it. Ed kept up the hunt for bears, but found no more of them.

A good part of the time was put in fishing. I had fished about there on the river but could catch nothing but cat-fish, which are there yet, it seems, but they got suckers and one large sturgeon as well. Ed got him, of course. He sends me an invitation to camp with them next year and hunt bears with a ball bat. May be I will.

CABIA BLANCO.

Down in Maine.

BANGOR, Me., Oct. 10.—*Editor Forest and Stream:* The past week has been one of a good deal of interest to those who watch the game shipments, since it was looked to, in a measure, to indicate the actual attitude of the non-residents toward the new law. Still, it is yet too early to tell with definiteness the actual deterrent effect it will have; but indications are that the falling off from previous seasons will be considerable. The shipments of deer through this city to date are largely to points within the State, although the last few days have shown an increase in the percentage of deer shipped to non-residents.

In this connection an interesting point came up with the wardens on duty at the Maine Central Station here this week. A sportsman from another State killed his two deer, but not wishing to ship both to his home, shipped but one, and sent the head of the other, under a taxidermist's tag, to the taxidermist who was to mount it. He then started for home with the feet and some other unimportant parts of his second deer in his hands, in a bundle. The latter being plainly open to view was, of course, clearly within the law. Still, as he had not expressed his second deer, the second set of coupons was still attached to his license, uncancelled, and if he so desired, he might readily come into the State later and kill and ship out a second deer, or rather a third. The wardens finally decided that the coupons must be detached from his license, and the proper one attached to the parts which he carried of his second deer, that there might be a proper record at Augusta of the number of deer killed, and to prevent abuse of the license. As the rules provide that the coupons must be detached by the express agent at whose office or station the game is shipped, this contingency evidently never occurred to the framers of the rules.

The astonishing record for bears, of which mention was made last week, continues to hold good, and still more members of the numerous bruin family are coming in, almost an average of one a day since the opening of the season. J. N. Barnes, of this city, left the other day for a hunting trip at Amherst, a town about 35 miles from this city, and within an hour of his arrival at that place had shot a bear, and the following morning the stage brought it in to be converted into a rug.

While, of course, the moose season does not open until Thursday of next week, and no moose heads can be shipped from Maine territory before then, the sportsmen who are in simply for deer, are finding them in abundance, even more numerous than most of them would have believed possible. S. L. Preble, of Waterville, who was at Pickerel Pond, a few miles out of

Oldtown, with two friends from the same city, saw in one day ten deer, which is the largest number, he says, that he ever saw in one day, practically together, in open season.

One jolly party of residents has just returned home after a most enjoyable and successful deer hunt at Askwith, some 20 miles west of Greenville, on the line of the Canadian Pacific Railway. In the party were E. T. Wyman, A. F. Drummond, Robert H. Stobie, J. H. Bennett, J. A. Davison, W. A. Hager, S. A. Green, E. S. Jepson and M. J. Roderick, of Waterville, and their express bills called for two deer apiece for all but Hager, Green, Jepson and Roderick, who had but one each.

Landlord J. N. Berry, of the Lakewood Hotel, at Lakewood, N. J., who has been at Moosehead Lake for an outing, took out two deer as his share of Maine-raised venison for this year.

F. S. Snyder, owner of Camp Caribou, on Williams stream, a tributary of Moosehead Lake, who has been entertaining a party of friends there for the early hunting, sent home three bears the other day, and his brother, J. S. Snyder, has his full complement of deer.

F. H. Hayes, B. L. Call, W. L. Fay, of Dexter, and R. A. Kimball, of Bangor, who have been at Houston Pond, three miles from Katahdin Iron Works, have returned home with one deer apiece to their credit.

C. E. Brett and J. A. Thurlow, of South Paris, passed through this city this week on their return from a stay at Molunkus Lake, reached via Mattawamkeag, with two bucks and two does.

Rt. Rev. Wm. H. O'Connell, of Portland, Bishop of Maine for the Catholic Church, and his secretary, Rev. C. W. Collins, came near losing their deer a day or two since. They had been on an official visit to Winn and were taking home two nice deer. Having occasion to stop off at Oldtown, they let their deer go ahead of them, and the wardens seized the game, as it was not accompanied, the law providing that residents must accompany their game to its destination. As the weather has been too warm for real safe transportation of venison ever since October came in, the two deer must have been sold to keep it from spoiling, had not the reverend gentlemen put in an appearance that afternoon and claimed it.

ward Campbell and R. M. Barker, of Newark, N. J., have been on a trip to the Grant Farm, beyond Roach River, and secured a handsome buck apiece.

R. G. Miller, of New York City, who went to Nesowadnehunk Lake for his hunting trip, has sent to a taxidermist in this city two fine deer heads, and doubtless will add a moose to his record as soon as the law permits him to shoot one.

A Bangor taxidermist thinks that two Cambridge, Mass., sportsmen ought to be satisfied with their trip into New Brunswick, proof of which was in the shape of specimens sent here for mounting. The men in question are Francis T. Colby and P. Oakes, and they shot a bear, two caribou and a moose.

HERBERT W. ROWE.

In New England.

BOSTON, Oct. 10.—*Editor Forest and Stream:* It is too early yet to say much about the success of our gunners, or what sort of a season we are to have for shooting upland birds this year. Dr. C. F. Berry, of Boston, writes that he went out once for quail without securing any birds. He says he "never saw a fall when the trees had changed so little by October 1. They are just as green and as thick with leaves as they were two months ago. Birds are therefore well protected, and you might walk over a quail and not know it."

He also reports that talking with several sportsmen he learned that a few partridges had been killed in Dover, and a good many quail have been seen in Medford. He also heard of a pheasant or two in Needham. He will start to-day for a week of bird shooting in New Hampshire. Mr. Charles Fowle, a taxidermist living in Burlington, reported to-day that he has seen several gunners in his section, especially on Sunday. He says he has seen a brood of seven young pheasants several times in one of the neighboring towns this season, and he expects to hear that they have been shot. Mr. George F. Gaines, president of the Klondike Gun Club, of Rockland, Mass., writes that sportsmen in his vicinity have not secured many birds, and some of them are of the opinion that the great amount of rain that fell during the spring months was disastrous to the young birds. His club, he says, has put out a large number of white rabbits, and would be glad if a law could be passed to protect them. The members have a club house on one of the large ponds in the town of Hanson.

Your readers will be pleased to learn that the two Fall River men who handled the consignment of short lobsters from Boston, of which I wrote in my last letter, have been convicted and fined.

Shore birds thus far have been in small supply in the Boston market and most of the gunners report light bags, but the easterly storm now raging with great severity along our coast will undoubtedly drive in a great number of birds, to the delight of the hunters. In conversation with Vice-President Wiggin, of the State Association, last evening, I was surprised to learn from him that last year 100 deer were killed in his native town, Sandwich, N. H. In the town of Canaan, only 17 miles from the seat of Dartmouth College, three deer were killed the first week of the open season this year. A fine hunting region is easily reached from Littleton, and it is reported that sportsmen are revelling in the condition now existing in that section. Almost daily someone returns with deer, bear or other game.

Two Littleton sportsmen recently killed two 200-pound deer at Nash Stream. Mr. Daniel Glines saw three bears near his house in Landaff, and succeeded in capturing one of them. Similar reports come from Celebrook and from the camps at Connecticut Lake.

One may go into any part of the three northern counties of New Hampshire, and by going a few miles from the centers of population into the forests, return well laden with spoils.

Vermont, too, is making a bid for sportsmen, and there are several counties in that State where farmers and travelers have seen herds of deer along the highways

and elsewhere. They are reported to be more numerous this year than ever before. Within the limits of the village of Bennington three have been seen within a few days. The open season is the last ten days of October, and local gunners, as well as quite a number from outside the State, will try their luck on the 22d of the month.

A Boston sportsman tells me a movement is on foot for the purchase of the camps, etc., at Carry Ponds, Me., for the benefit of a club of gentlemen who have been accustomed to go there from year to year. This gentleman is a native of Maine, has had much experience in fishing there, and says he has always had excellent sport on these ponds. A consignment of salmon for stocking Tuft's Pond, Kingfield, has been forwarded from one of the federal hatcheries, and fishermen are likely to have improved sport there, although there have been quite a good number of salmon captured this year, the largest 6¾ pounds. Woodcock shooting is reported good about Clear Water, some of the best shots bringing in from 10 to 20 birds a day.

Two members of the State Association, A. D. Thayer and Dr. Martin, of Franklin, have formed a party of twelve big-game hunters and left Friday evening for New Brunswick. I hear of other parties that will go soon. The field trials of the Brunswick Fur Club will be held at Harre the coming week, and will no doubt attract a large number of the devotees of fox hunting.

CENTRAL.

Wild Rice.

PHILADELPHIA.—Since the publication by the Government of "Bulletin No. 50. Wild Rice," its uses and propagation, I have received numerous letters of inquiry from different parts of the country. "Where can I get good wild rice seed?" Charles Gilchrist, of Port Hope, Ont., has an advertisement in *FOREST AND STREAM*, and probably may supply those who make application.

Mr. Edgar Brown has answered the question of how to plant it, in the bulletin referred to. He has left little to be written on the subject. I think, however, that it will grow better in two inches of water than in two feet, and probably four feet would be fatal to perfect development. Of this, however, I am not perfectly sure. It will certainly grow in brackish water; that is, water of little salinity, where there is tidal action. In sluggish streams and ponds where marine and plant life is active, and in profusion, throw in as much rock salt as seed. Twice the quantity of salt will do no harm. I have tried this successfully. The prime factor is patience and perseverance. D. M. HALLAM.

[For the republication of the Wild Rice bulletin referred to, see *FOREST AND STREAM* of Sept. 12, 1903.]

Paste it on Your Gun.

Editor *Forest and Stream*:

There is a little notice on page 263 of the current number (Oct. 3) that I have thought might be put to a good use by some men who are in the habit of shooting at almost everything they see moving. The shape that this notice has been printed in suggests a use for it: that is, to cut it out and paste it on the stock, or still better on the barrel, of the gun, just back of the rear sight, if it is a rifle.

Should there be both a rifle and shotgun in this man's armory, then put it on the shotgun, or it might pay to send another copy of the paper and get a notice for each gun. Some county may save the expense of a coroner's inquest in consequence of this notice being on the gun. Put in on the gun by all means. We can read it in the paper, but we are liable to forget it when it is most needed. "Don't shoot until you see your game, and see that it is game and not a man" is about as good a piece of advice as can be given in the same number of words. CABIA BLANCO.

Tenth Annual Sportsmen's Show.

The tenth annual Sportsmen's Show will be held at Madison Square Garden, Feb. 10 to March 5, 1904.

In accordance with the suggestions of many of the exhibitors at former shows, it has been decided to adhere more closely for the show of 1904, to the lines that won for its earlier exhibits so great a degree of popularity among visiting sportsmen and such general satisfaction among exhibitors. For the coming show, no experiments will be tried: the best and most popular features of the past nine years will alone be employed; to these, more space will be given, and great effort exerted to make them complete in every detail: sports of the woods and the water, with gun, rifle and paddle will be attractively exploited, and every inducement will be offered manufacturers of sportsmen's supplies—guns, rifles, revolvers, fishing tackle, articles of camp equipment, boats, launches, canoes and sailing craft—to make extensive exhibits of their product and, together with their salesmen, to be present at the show to meet old customers, and to form the acquaintance of new ones.

There will be fly-casting, water games, rifle and revolver shooting, trap shooting, displays of game birds and animals, and the exhibits of camps.

Pennsylvania Grouse.

Messrs. Price Bros., of Pocono, report a goodly supply of ruffed grouse in the Pocono covers, and an excellent outlook for sport for the 1903 season, which opened on Thursday of this week.

Sourdnhunk.

WORCESTER, MASS., Oct. 9.—Having watched the Great Northern Paper Co.'s camp at Sourdnhunk since last April, when the crew went down river, and being in position to observe a good deal of the country surrounding that region, I thought I would drop *FOREST AND STREAM* a line. I notice in your columns about this being a great year for bears. I think this

is true, as the man with me and myself saw quite a number, and their tracks were in evidence everywhere around our camp and around other camps in the vicinity. William McLean, who owns a sporting camp at the lake, trapped a very large one at Black Brook, which is ten miles from Sourdnhunk Lake. Moose were very plentiful, and it was very common for us to see everywhere from six to ten every time we went up the lake. Even sitting outside the camp, we would often see one walking down the brook close by. The deer, driven by the fires which prevailed this summer toward the lake, were very plentiful also. Partridges were not too abundant, and we did not see many. The trout, for which Sourdnhunk Lake is famous, were about in the same humor as usual, and would bite on anything from a piece of pork to a bit of bark. Irwin Hunt, who has a sporting camp on Kidney Pond, right at the mouth of the Sourdnhunk stream, had several fishing parties, all of which were well pleased with their respective trips; quite a few of them got very good pictures of moose swimming across Kidney Pond. The fires played great havoc on many of the lumbering camps in that region (Bert Howe having three camps demolished, one at Black Brook and two in that vicinity). In closing I will say that I think any one looking for a little moose hunting this fall will do well to go to Sourdnhunk, as they being so plentiful there this summer, shows that there is some fine sport to be had in that region.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

How Two Ministers Went a-Fishing

FISHING and apostleship, if we may judge from the early records, go well together—four at least of the chosen twelve being fishermen by occupation. And, indeed, when one comes to make fair analysis, there would seem to be quite a number of points of resemblance between the traits which should characterize fishers of men and fishers of fishes—such, e. g., as patience, perseverance, carefulness, caution, tact—to say nothing of *truthfulness*!

It is not at all to be wondered at, therefore, that two friendly ministers, myself and one whose parish was located in northeastern Maine, near the Schoodic waters, a chain of some forty spring-fed lakes, should have found themselves possessed of a simultaneous desire to tempt with seductive fly some of the plump landlocked salmon (ouananiche) which abound in said waters, than which it is but simple truth to say that a nobler or more gamy fish does not swim in any waters on this or any other continent. This is attested by the fact that often, on finding themselves "struck," they leap boldly some two feet out of the water preparatory for making strenuous battle.

For the sake of easy distinction we will call the name of the local minister simply X.; and as he was familiar with all the wilderness region and each of us had some skill with the paddle, it was decided that we would dispense with the customary Indian guide and paddle our own canoe. This, of course, was to be a birch, that marvel of lightness and grace which only aboriginal skill and patience can properly fashion. A few sheets of white bark, a few slats of fragrant cedar, all bound together with the smooth, sinewy cords of spruce rootlets; a few spoonfuls of pitch on the lappings here and there, and lo! all is done, everything staunch and trim and tight.

Providing ourselves therefore with one of goodly dimensions manufactured by a branch of the Passamaquoddy tribe residing on Lewys Island, and which floated on the water as light and dry as a cork and as graceful as a young swan, on a certain day in the early fall of 18— we proceeded to stow away therein our guns, rods, tackle, tent, and provisions for a brief and happy cruise in that wilderness region.

Up through Round Lake and Lewys Lake we passed till we came to the island, where were several birch canoes in process of construction by elderly men, some stalwart Indian youth skillfully shaping lithe maple paddles, to say nothing of sundry dark-eyed Indian maidens to whom our writers of early romance were so fond of introducing their patient readers.

Then on through Long Lake, Pokemoonshine Mountain looming up on the one hand and Musquash on the other, a cloudless sky of deepest blue bending over us, the water beneath being so pure and crystalline that pebbles could be distinctly seen on the bottom many fathoms below, while our canoe glided along as smoothly as a bird sailing through the air, the silence being unbroken save by the rhythmic lap—lap—lap of our paddles as we sped on our way. If there be any scene more restful and soothing to the tired man accustomed to walking the hot, dusty, city streets, or more fairy-like to one given to poetic fancies, I have yet to view it. It seems, in fact, to be a part of a new world, the old world with all its roar and hurry and rush and its manifold cares and worries being shut out and forgotten.

An hour before sunset, on a green little knoll just above Little Falls our camping ground is reached. So we have ample time before the dark came on to pitch our tent and provide our bed of soft, elastic spray from some thrifty young hemlocks growing hard by. Has it ever been your happy fortune to pass the night on such a fragrant bed, with the gentle stars shining through the open flap of your tent and the soothing murmurs of a nearby waterfall lulling every sense to peaceful slumbers and happy dreams? If not, then it will be impossible even to imagine how pleasantly the dawn of a new day breaks upon one, every faculty rejoicing in the sweet refreshment of unbroken rest.

Just a few casts of the fly in the quick water above the

falls bring a couple of as relishable three-pounders as one could wish for breakfast, even had appetites been less keen than those sharpened by the paddling exercise of the previous day, and the tonic ozone of the bracing wilderness air.

Then came the business of the day, X. carefully selecting the place just above the falls where our two breakfast salmon had been captured, and myself a rock near the middle of the stream some dozen rods further up.

And here occurred a marvel which to this day I have been utterly unable to account for, and which suggested the title of this communication. Was it luck? And if not, then what? Will some of my brother fishermen with a larger experience than my own please explain. Every once in a little while my fingers were made to tingle as by an electric shock as I felt that peculiar nervous vibration of line which every true sportsman knows so well, while the rapid whirring of the click-reel made a music more exhilarating than a Chopin waltz and sweeter to the ear than even a Beethoven symphony.

Then X. would cry out: "What! Got another? I can't get so much as even a single rise." In fact the history of that autumn morning might be set down about as follows:

Click! click! Whr-r-r-r goes my happy reel.

"What, still another! Why don't they take my flies?"

Click! click! Whr-r-r-r!

"Another one! What sort of fly are you using?"

The information is given and X. changes his flies accordingly. But with the change of flies there yet comes no change in luck.

Click! click! whr-r-r-r! again sings out my reel while his remains most perversely silent. No wonder that at length his patience—though I am happy to say that not his temper—is almost exhausted, and that he cries out:

"No fish here! Those two which you caught for breakfast were the last of the lot. They have all gone up to your rock!"

"Well," said I, "let's change places. I am sure I don't deserve all the luck."

So the places were changed, but still the luck did not seem to change. "Click! click! whr-r-r-r!" my reel would keep going while his still was silent.

At length X. cried out: "I believe that the luck is all in the flies—that some sort of happy spell has been laid on yours and one just the reverse has been laid on mine. Can't you spare me a few of your flies?"

"With all my heart. Plenty of them. Here's my book. Take your choice and all that you want."

But somehow the "happy spell" did not seem to follow the flies after they left my book.

"Click! click! whr-r-r-r!" my reel would keep going while his remained as perverse as ever.

I wish I could tell you all the various expedients we tried to break the unlucky spell of which my friend complained. Change of places, change of flies, change of rods, even change of reels and lines, all seemed to make no least difference. So that, when our day's labors were ended, more than a score of plump ouananiche graced my pile while only a meagre three were found in his.

Now the problem is simply this: How to account for this great difference? How, on the one hand, was X., who had lived for years within twenty miles of Grand Lake Stream, had been there time and again, and who prided himself on being one of the best casters of a fly in all that region. And how, on the other hand, was myself, an inexperienced angler, who had never so much as cast a fly till a single year previous, and with only a common rod and tackle, and yet the net results of our day's work stood as twenty to three. As I have said before, I have never to this day been able to account for the discrepancy. Had the numbers been just reversed, the twenty being to his credit and the three to mine, I could very easily account for it all; but, the case being as it is, makes it all a puzzle. Is there not really such a thing as pure unadulterated unaccountable luck? And now, after subsequent years have added somewhat to my piscatorial experiences, when I meet with poor success and come out second best, may I not give myself just a grain of comfort and say: "Well, it was all just that other fellow's luck?"

AVERY S. WALKER.

WELLSLEY HILLS, Mass.

Trout Fishing at Night.

THE trout has been persistently sought from the early morning until the darkening shades of night; but how many of us can boast of having taken him with the fly during the midnight hours?

Night fishing is a mode of angling for which we are indebted to an old fly-tyer and fisherman who had his home on the banks of Spring Creek, a noted stream in western New York. This manner of fishing is very similar to our fly-fishing, except that the flies, which are several sizes larger than our day flies, are drawn much slower through the water. They are intended to represent the caddis fly, a fly which derives its name from the case or shell which the larvæ constructs for itself from various foreign substances, including small sticks, stones, shells, etc. The grub lives under the water until it is ready to be transformed into the fly, is very voracious, devouring large quantities of fish spawn, and is extensively used by anglers for bait. The fly makes its appearance about the middle of June, although, like other flies, is subject to the season. It varies in color, having sometimes a brown wing, sometimes a mottled, and still again being entirely white, when it is then known as the white miller. During the day it clings to the bushes along the stream, and as the shades of night begin to fall, makes its appearance.

The night fisher rigs up his leader with the artificial imitations of this fly, which in his vocabulary are known as "night flies"; generally two, yet often three, but never more, as more would be difficult to cast. Perhaps in his inside pocket may be found a small box of worms, or more modestly "barnyard hackle." On this article discussion is forbidden, as it has somewhat the scent of bait-fishing, nevertheless, a little bait on the lead fly often takes the trout where the bare fly fails.

Thus equipped, the fisherman sallies forth. If the night is dark and no moon, so much the better. The favorite spot is reached just before dark. The angler

sits back in the bushes, where a good view of the stream can be had, to wait for the fish to begin feeding. A slight motion in the water tells him that the big fellows are coming up out of their hiding places and slowly moving into shallow water to lie in wait for the nice, fat caddis fly.

Now the last ray of day has disappeared, and everything is quiet save the flap of a fish as he leaps for a fly which is rather high, or the splash of a muskrat as he plunges off a nearby log to pursue his nightly occupations. The angler creeps quietly out of the bushes, pushing his rod ahead of him. The first few casts are made where the fish are not feeding, merely to get out a little line. Then a cast is made just behind a bunch of watercress, where a good-sized trout has been feeding. There is a rush, a swirl, and the fun begins. A small net is produced from somewhere, and the fish, a fine brook trout, is stowed away in the basket. In like manner several others are landed. He has just made a cast clear up to the projecting bank, a mighty swirl and a ting as the hook strikes solid. Now is the time that the angler forgets all his worldly troubles. A thrill of excitement shoots through him as the fish, "an old socker," rushes across the stream toward a friendly stake. To allow him to make one turn around this stake would mean a broken leader and a free fish. All this passes through the angler's mind like a flash, and at the risk of his tackle he holds him fast, and finally succeeds in turning him up stream. The slack line trick, with which the old trout has freed himself several times before, is resorted to, but the automatic reel is equal to the occasion, and never an inch of line does he get. Several more rushes, each one shorter than the one preceding, and he begins to sulk, occasionally coming to the surface with a splash. Thus, after being drawn several times almost to the net, he is landed, the largest of the season, a good three-pounder. He is rapped on the head to kill him, and this time the cover of the basket has to be opened, the hole in it being too small.

The fish in this place being thoroughly frightened, our night fisher moves on to the next hole with mixed feelings of congratulation and anticipation. By this time it is far into the night and very dark. The bare flies fail to attract the fish so well, so, out of the depths of the inside pocket come the worms which are used to capture a few more. These being safely landed and put with the others in the basket, the angler, now well satisfied with his catch, winds up his line, securely fastens it, picks his way back through the woods, and takes his way across the fields to his home.

Of course, this kind of fishing is not without its difficulties. The slippery log, the overhanging tree, etc., hardly ever fail to play their part; but to the true disciple of Izaak, these only serve to add to the fascination of the sport, as well as to furnish pleasant thoughts for many a weary hour. It also brings us into touch with that part of nature which is only seen at night, and which I dare say a great many of us know little about.

H. K. A.

The Devil's Lake and its Big Trout.

SITUATED in the very heart of the Canadian Rockies, and surrounded by scenery of the grandest description, the watering place of Banff is one of the garden spots of the New World. From May to September the splendid hotel built by the C. P. R. is crowded with visitors from every part of Canada and the United States, brought there either by the beauty of the place or by the fame of the natural hot sulphur springs, which are reputed to be an unfailing cure for rheumatism and many of the other ills which poor human flesh is heir to. There are plenty of trout, too, and grayling in the Bow and Spray rivers, which join their waters just below the hotel, but to the angler the great attraction is Lake Minnewanka, or the Devil's Lake, nine miles away. It is a long, narrow sheet of water lying embosomed among the everlasting hills, and no one looking at it, as I did, for the first time on a perfect August day, with its calm surface of brilliant blue unbroken by a ripple, and reflecting the mighty surrounding peaks as faithfully as a mirror, would think that it could possibly deserve its ill-omened name, or the many bad stories told of it by both red and white men.

Nevertheless, the lake has always borne a bad reputation among the Indians, who are very chary of venturing upon its surface either in summer or when sheeted with ice in the hard Canadian midwinter. The popular notion is that deep down in mid lake His Satanic Majesty has his abode, or at least one of his abodes, and that if anyone afloat offends him in any way, either by word or deed, a huge hand and arm is thrust up out of the depths, and both boat and occupants dragged down to a watery grave. A sure way of giving offense and bringing retribution upon oneself is to sing or whistle while fishing, and even the white men in the neighborhood—though, of course, they profess utter disbelief in these legends—are in reality very careful to suppress their musical tendencies on the lake, even in the calmest of summer weather. Like all long and narrow mountain lakes, Lake Minnewanka is very subject to sudden and fierce squalls, and no doubt in days past many a boatman has paid the penalty of over-confidence; hence the lake has gained its diabolic name and reputation, a reputation shared more or less by the whole neighborhood, as a few miles away the Ghost River, with its uncanny name, will show. Be these things as they may, there is no doubt about the number and size of the trout who share his majesty's domicile in the lake. Ten, twelve and fifteen-pounders are common, twenty-pounders by no means rare, and occasional monsters of thirty pounds, and even forty pounds, are dragged from the infernal regions into the light of day. One of over forty pounds is to be seen in the museum at Banff, and Mr. Astley, the host of the small hotel on the lake shore, has the heads and measurements of several over thirty pounds.

Singularly confiding, too, are these big fellows. There is no need of fine tackle; anything finer than a ship's cable is fine enough, and that notwithstanding that the water is the clearest I have ever seen. Mr. Astley himself never uses a gut trace, but attaches his lure direct

to a good, strong reel line with the best of results. The best, indeed, I found it the only, bait is a good-sized gold spoon, the efficacy of which is much increased by the addition of a strip cut from the side of the first victim. Phantom and Devon minnows I have tried in vain, but no doubt if I had not been trolling a spoon on the other side of the boat, I might have accounted for one or two with them. I have paid two visits to Lake Minnewanka—the first in August, 1899, when I stopped off at Banff on my way across the continent to hunt wapiti on Vancouver Island, an account of which trip appeared in the columns of the Field.

Beautiful as Banff is, and amusing as the cosmopolitan throng of visitors was, I had not come to Canada for that sort of thing, and one fine morning I packed my bag, and two rods, a single-handed 13-foot white trout rod which had already been the death of many a white and brown trout and not a few salmon, and a small 10-foot Farlow, and hired a "rig" for the nine-mile drive through the National Park, and past the enclosure of 500 or 600 acres, where a thriving herd of some twenty buffaloes are kept.

Arriving at the lake, I was most hospitably received by Mr. Astley, a good sportsman, and like many others in the same position in the New World, a cultured and refined gentleman, and, therefore, a charming companion as well as host. I set to work as soon as I had swallowed luncheon, and it was not long before my little 10-footer was bending double under the strain of a six-pound fish. I fished with varying success for two days and a half, losing many fish from the fact of my rods not being stiff enough to drive the big hooks home, and the total bag amounted to nineteen trout, varying from four pounds to nine and a half pounds, besides six grayling, caught one evening with blue-bottle flies, varying from one and one-half to three pounds. Mr. Astley told me that I was too late in the season to get any of the real big fellows, and that he very seldom got anything over twelve or fifteen pounds after the end of June.

I determined, therefore, to have another try earlier, if anything brought me into this part of the world again, and last year (1902), on my way to Alaska, I again stopped off at Banff early in May, and after one night spent almost in solitude at the Sanitarium Hotel, as the tourist season had not yet commenced and the big hotel was not open, drove out along the well-membered road full of eager anticipations. Alas, when I arrived in view of what ought to have been an open sheet of water ruffled by a strong northeast wind, an ominous stillness was apparent, although the lake was still some two miles distant. It was quite obvious that the ice had not yet gone, and I could only hope that there might be enough open water to give me some sort of a chance. I found Mr. Astley at the door of his house, just the same as before, and very pleased to see me, and his daughter, who had been three years before a little golden-haired tot of ten, and a great friend of mine, grown into quite a big girl, and a trifle shyer than she used to be, but still not forgetful of her old friend. There were about three acres only of open water at the near end of the lake, and along its whole length of eleven miles not another spot could we see. Mr. Astley was not hopeful. No trout had yet been killed, but if the wind did not change we could at least go out and try. But change it did before I could swallow some lunch and get the boat in the water, and in ten minutes the ice was grinding on the shore, and not enough water in sight to float an egg shell.

There was nothing to be done but to try for trout in the Cascade River, which runs out of the lake, which I did all the afternoon without moving a fin. Next morning a good off-shore wind gave us great hopes, but after exactly an hour's fishing and a six-pound trout, the first of the season, round it went again, and home we had to go. This time I had no rods of my own with me, and had bought an American split-cane rod at Banff, which cost \$6.50, or 25 shillings. The wretched thing snapped short across above the reel like a carrot directly my first fish struck, and I had to hand play the fish and borrow another rod from my host. The third day was worse than ever—an unbroken sheet of ice for some three miles from our end of the lake, though the gap of open water beyond was evidently widening, the ice having been broken up a good deal by the strong wind which had blown all night.

This day I did not fish at all, but went for a long walk along the trail which leads through the mountains by the Ghost River country to the plains. The next day hope returned, there was a couple of miles of water at our end and an open channel a couple of hundred yards wide on each side for at least a mile further. We went at first along the right hand side, and, after trolling without success until we were nearly at the end of this channel, I suddenly noticed that it was getting perceptibly narrower, although there was not a breath of wind. We had to turn and race for it, as it is an ugly thing getting nipped in the ice, which moves with irresistible force on these big sheets of water and piles itself up sometimes 10 or 12 feet high on the shore while breaking up. We just did it and no more, and then decided to try the opposite channel, which this movement of the ice had naturally made wider.

On our way across the end of the lake my host's small boy, who was with us, and who was trolling a spoon on a hand line, hooked a trout, which he hauled in manfully hand over hand, until he had it within a couple of feet of the boat. I had, meanwhile, reeled up my line all except a few feet, and my spoon was dangling close alongside. As I leaned over to gaff the trout for the boy, the hold gave way and the spoon dropped out of his mouth, but without losing a second he just darted round the stern of the boat and seized my bait, almost pulling rod and all overboard. I caught it just in time, and, luckily, finding all clear, had the satisfaction, five minutes later, of landing a lusty nine-pounder. This shows how voracious the trout of this lake are just when the frost breaks up. Two minutes after I was stuck in another, but lost him after five minutes' play. By this time we were well into the left-hand channel, and here I hooked a third, which I landed—another nine-pounder. After trolling up the channel as far as the ice would allow, we turned to go

back, and just at the same spot where I had killed the last trout I found myself fast again. This was evidently a bigger fish, and a better fighter than any I had yet encountered, and it took several minutes to get on terms with him. Before I had well done so, I became aware of a crashing, grinding sound all round us, and saw the ice again in rapid motion coming back to us, and rapidly filling up the narrow channel and piling itself up in high banks on the shore. Astley adjured me to break at once before it was too late to get out, as, although we were so close to the shore that there was very little danger to ourselves, there was every probability of the boat being crushed like an egg shell. I dropped the rod, and with the line in my fingers, pulled for all I was worth, either to break or to haul my friend in by main force. A good, new reel line and a steel trace enabled me to do the latter, and a big, fine trout it was I pitched inboard amid a tangled mass of line, without even taking the hooks out of his mouth, just as the ice closed in on us. In a second we, two men and the small boy of nine, were out of the boat, and not without considerable exertion, had her up on the ice just in time to save her being stove in.

We had then to drag her about 200 yards across the surface of the ice, which, although still some 7 or 8 inches thick, was quite rotten on the top for about 2 inches before we could float her again, and then ensued another race to the beach opposite Astley's house. Five minutes after we landed, all that end of the lake was ice-bound again, and thus ended my second expedition to the Devil's Lake, as I had to go away next day, and it never cleared again before my departure. We agreed that although we had got the better of him this time, the tutelary genius (?) of the place must certainly have taken offense at us and have been doing his best to thwart us and spoil our scheme. This last trout was the best and biggest of the lot, weighing twelve pounds, and is, I suppose, the best I shall capture in this lake, though I know from ocular experience that many finer specimens are there to reward anyone lucky enough to be on the spot late in May or early in June.

These trout are unlike any I have seen elsewhere, and the natives say they are peculiar to the lake. They are not handsome to look at, though broad and thick and well shaped. Their color is a dirty gray, and they are rather mottled like a mackerel than spotted like a trout. They have an adipose fin like all the *Salmonidae*, and their flesh is rather a pale orange than pink, but firm and very good to eat. I took memoranda of the number of fin rays, etc., but have unfortunately lost or mislaid them. They are not champion fighters, and play rather more like a sea fish than a trout; in fact, they remind me strongly of the many bouts I have had with coalfish and lythe on the west coast of Scotland. Still, with my small single-handed fly-rods I had good enough sport with them to satisfy anyone, and on my last day, if the titular owner of the lake had been more charitably disposed, and had kept the ice off a little more than an hour and a half, I had three fish weighing twelve, nine and nine pounds, respectively, and lost another. The chance of a forty-pounder may be remote, but they assuredly do exist, and apart from the charm of the locality, this chance is enough to make it worth the while of any sportsman traveling across Canada to pay a visit to the Devil's Lake.—R. Claude Cane in London Field.

Pollution of Lake Champlain.

THE wealthy residents and landowners round and about the region of Lake Champlain have been aroused by the actions of the lawless element in the Adirondacks. That element, emboldened by the immunity from arrest of the assassin of Orrando P. Dexter, last week threatened the life and property of Mr. Edward Hatch, Jr., whose preserve lies due east of the scene of the Dexter tragedy. These summer visitors to Lake Champlain are more determined than ever to support Mr. Hatch as leader in the fight against the owners of the pulp mills who have been turning their chemical refuse into the rivers which pollute the lake and kill the fish. They have also determined to make every effort to capture the men who have threatened Mr. Hatch's life, and to that end have engaged detectives to take up the case.

There has been some delay in presenting the results of the official investigation of the waters of Lake Champlain and the Bouquet and Au Sable rivers, recently made by Professor Olin H. Landreth, consulting engineer of the State Department of Health, to Governor Odell, but it is expected that the report will be placed in the latter's hands early next week. Meanwhile the mills are keeping up their work of pollution and destruction in defiance of the law.

With each succeeding week the ranks of the residents and property holders engaged in the fight against the offending mills gains in numbers, strength and influence. Dr. Seward Webb, who has just returned from Europe, has announced that he is determined to stop the lake's pollution. His famous preserve, Shelburne Farms, stretches for eight miles on the shore opposite the river on which the pulp mills are located. It is expected that Dr. Webb's wealth and social and political influence will be an important factor in bringing the mill owners to terms.

As president of the Catholic Summer Home Association, with its fine sweep of property on the shores of the lake near Plattsburgh, the Rev. Father Lavelle, rector of St. Patrick's Cathedral, Fifth avenue, New York, has interested himself in the contest. In speaking with a representative of FOREST AND STREAM on the pollution of the lake, Father Lavelle said that he had often noticed the presence of impurities in the waters, which he had been told was caused by the refuse of the pulp mills. "However," said he, "I am not as well posted on the subject as the superintendent of the Catholic Summer Home, and I will write him at once to make a full investigation and to let me know at the earliest moment the exact condition of affairs. I have decided to await this report before taking an active interest in the matter."

Mr. A. G. Paine, Jr., General Manager of the New York and Pennsylvania Company, was seen in New York city the other day and asked to make a statement in regard to the pulp mill nuisance. Said he:

"The New York and Pennsylvania Company have had a pulp mill on the banks of the Bouquet River for the last twenty years, and have manufactured there pure cellulose from white poplar wood, which is dissolved by boiling with soda, and this soda, after the boiling, is practically all recovered, so that the only residuum allowed to escape is a trace of soda and a trace of spent lime, which is equivalent to nothing more or less than sand. The examination recently made by Prof. Landreth will show, when he makes his report, that, instead of rendering the water impure, the flowage from the mill has a tendency to purify it, and this fact will no doubt be embodied in his report to the State authorities. This is the only conclusion that can be justly arrived at. I myself have a residence on a point of the lake near the mouth of the river, which I have occupied for more than five years, and during that time I have used the water for all domestic purposes with absolutely no ill effects.

"It was about fifteen years ago that the first complaint was made against our mill, and as a remedy we ceased dumping our lime sludge into the river while the fish were running, as some people erroneously thought it was harmful to them. You see, notwithstanding we knew it was more beneficial than harmful to the fish, we respected the complaint.

"A few years later we received more complaints about the presence of our lime sludge in the river and lake, and as a result, we built at large cost, a great dyke to keep the lime sludge from escaping into the river and thence out in the lake. So we now dump nothing in the river but clear waste water having in it but a trace of soda and spent lime, which in fact is just like the lime juice served at a soda fountain in a drug shop, only infinitely more weak. In fact, it is the same thing only not nearly so strong as the lime juice nowadays generally put in milk on which babies are nourished.

"Indeed," animatedly concluded Mr. Paine, "our waste water with its trace of soda and lime, if the public only knew it, tends to star the waters of the lake and make them brighter and more sparkling than nature could accomplish. As a matter of fact, instead of being persecuted as we have been, we should really be paid, and paid well, for clarifying and purifying the waters of the river and the lake."

A prominent railway official, who is known to have large milling interests in the Lake Champlain region, and who desired to have his name withheld from publication, on the grounds that he did not wish to be personally brought into the matter, made some remarkable statements when seen by the FOREST AND STREAM representative. Said he:

"I really can't see what all this row is about. All this talk about the pollution of Lake Champlain is Simon-pure poppycock. On the contrary, the mills are doing noble work in purifying the lake waters from the various contaminations, natural and otherwise, that are emptied into it. In this respect, and many others of a like character, the mills are really performing a most glorious public service.

"From time to time I have read articles in the papers telling about the alleged pollution of Au Sable River by the J. & J. Rogers pulp mill located there—arrant nonsense. This mill, as I well know, uses spruce timber in making its pulp, and it is true employs large amounts of sulphurous acid. What of that? Let me tell you that I have many times made a pilgrimage to the mill for the special purpose of drinking the sulphurous water discharged by it into the river. The sulphurous properties the water contains makes of it a wonderful tonic, rejuvenating to the entire system. After taking only half a dozen glasses of the water it has made me feel like a new man, and I know many others who have had the same experience. People often travel a thousand miles to drink and bathe in sulphurous waters that can't be compared with the waste waters of this mill. Search the world over and I doubt if you will be able to find a body of men of such magnificent physique as those employed in the mill there. Every man of them over six feet high and strong as an ox. These men drink and bathe in the water daily. Indeed, I am seriously thinking of erecting a sanitarium there which would be bound to be a great success."

"Is the sulphurous waste good for the fish, too?" ventured the reporter.

"Remarkably so," was the response. "Each year I find them growing in size and beauty, and their numbers constantly increasing. They appear to have greatly increased in liveliness, too, and this gives added zest to the sport of fishing.

"One thing more. I have seen it mentioned that the mill owners are denuding the grand forests about the lake, and thus destroying another of its renowned beauties and attractions. Nothing could be further from the truth. The work of cutting down the trees to make paper pulp is all in charge of expert landscape gardeners who spare no pains in producing lovely sylvan effects that in time will make the whole region round and about Lake Champlain the garden spot of the world."

It wasn't Baron Munchausen, come to life, who said these things. It was just a plain American railroad president with milling interests about the lake.

In commenting on the present status of the case, Mr. Hatch said:

"It appears that Lake Champlain is not the only body of water in which fish are dying by the wholesale on account of poisonous chemicals dumped into tributary waters by paper mills, which thus disregard the rights of the public, instead of otherwise disposing of their refuse. According to the Paper Trade Journal's Indianapolis correspondent, five suits for damages against the American Straw Board Company have been instituted by Madison county landowners, and transferred to the United States Circuit Court. The complaints allege that the Straw Board Company pours into White River more than 800,000 gallons of refuse daily from its plant, which, it is alleged, has had the effect to pollute the stream. The poisonous qualities of this matter have killed all the fish in the stream below the mill, and in addition made the water so bad that cattle would not drink it. Another cause of complaint against the paper company is that the debris thrown into the stream lodges along the banks of the river, making the vicinity unhealthy, owing to the distressing odors that arise therefrom.

"From Dayton, Ohio, also come complaints of a similar nature. It is stated that great schools of dead fish have appeared on the surface of the rivers in that vicinity,

and the health authorities, impelled to take action by the complaints of citizens interested in fish and game, have determined to find out the exact status of affairs in that connection. It is declared that the State authorities will take up the case, and if the straw board manufacturers are offenders the State Board will make it warm for them.

"Legislators in Vermont and elsewhere have not hesitated to take action against the dumping of sawdust into streams, and it will be no more of a hardship to compel paper manufacturers to dispose of their refuse in some other way than by dumping it into our rivers than to force the owners of other mills to do this. If there was no other way for paper mills but to pour poisonous chemicals into the streams on which they are located, the situation would be entirely different; but even in that case there would be a question concerning the right of the individual as compared with the welfare of the community. In point of fact, however, mill owners in some cases have instituted new means of disposing of their refuse, only to revert later on to the pollution of streams; and there is no reason, save the question of expense, why such refuse should not be dumped on premises prepared for this particular purpose. In the course of time the people of every State in the Union will come to realize fully the dangers which threaten them in the pollution of our rivers and will legislate accordingly."

P.

Albino Brook Trout.

Editor Forest and Stream:

A number of letters received since the closing of the State Fair at Syracuse, indicate that the extensive exhibit of live fish made by the Forest, Fish and Game Commission, attracted no little attention, and that the albino trout excited considerable curiosity. These trout came from the Adirondack hatchery located at Saranac Inn. The foreman of the hatchery, Mr. Grant E. Winchester, writes thus concerning them: "They were hatched from the regular brook trout eggs in March, 1902, which makes them about one and one-half years old. There were about fifty of them, some being of a silver bluish-gray appearance, but the most of them pure yellowish-white. They were placed in a separate compartment and given the best possible care and attention, but all have died except two of the pure albinos and two of the bluish-grays. The albinos have the crimson spots and pink eyes, but the grays show no spots."

Dr. Tarleton H. Bean, the well-known expert, when informed of the exhibit, stated that "The albino form of brook trout is by no means common, but has appeared sporadically in several localities within the last ten years." These "freaks" are apparently none the worse for being exhibited at the State Fair, and the hatchery foreman intends to experiment with breeding from them this fall. Should the fish die they will be mounted for the exhibit which the Commission is to make at St. Louis.

JOHN D. WHISH, Secretary.

[The Minnesota Commission used to have a stock of albino brook trout at the St. Paul hatchery.]

The Kennel.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Telegony.

THE following is the London Field's reply to a correspondent, whose spaniel bitch had whelped a litter to a mongrel dog, and who asked whether a future litter would be affected thereby, even if by pure blood sire:

The opinion that is expressed by our correspondent's friends is exceedingly general. We have known numerous instances of valuable dogs being destroyed under similar circumstances, they being regarded as practically spoiled for breeding purposes. From the same cause we have known valuable short-horned cows regarded as useless for breeding stock. It is singular that so general a belief in the doctrine of the influence of a first sire should prevail, when it is so easily confuted by practical experiment. The valuable long-continued experiments of Professor Cossar Ewart have removed all scientific belief in this doctrine. He bred seventeen hybrid Burchell's zebras from various mares of very different breeds. Some of these produced first foals to the zebra, and others had been mated previously. In every case these mares, after producing zebra hybrids, were mated with horses, and in not one single instance was the slightest trace of the previous zebra sire manifested. Anatomically and physiologically considered, there is no foundation for the belief in what may be termed telegony or breeding back to a former sire. The blood of the mother and that of the offspring do not mingle. So to speak, there is no possibility of the contamination of the mother by the blood of the hybrid. These experiments of Professor Ewart are regarded by scientists as settling the question, but they are not accepted by the uninformed public. One of the strangest things possible is that this doctrine, although believed by the majority of people, is never acted upon by themselves as regards the human species. A man who marries a widow does not expect that children born subsequently to his marriage will appear in the likeness of her first husband, and where different races of mankind interbred, such a thing is not observed or even suspected. We do not give this reply with the idea that our opinion will generally be accepted. The prejudices of the uninformed public are not to be overcome by facts.

Boston Terrier Show.

Preparations for the much-heralded Boston Terrier Show, at Boston, Nov. 17, 18, 19, are progressing very favorably, and everything points to a most successful affair. The premium lists are now ready for mailing. This show is given under the auspices of The Boston Terrier Club. The Bench Show Committee, chosen from its members, are men who have very much at

heart the best interests of the breed. There will be twenty classes, \$600 in cash prizes, nearly 100 specials already received, and others expected; also, this will be a four-point show. Entry fee \$3. Mr. Dwight Baldwin is the judge. Cash prizes and trophies will be offered in every conceivable manner, so that there should be no dog entered but what will be eligible to compete for some one or various specials. Horticultural Hall is where the show will be held. Entries close on Monday, Nov. 2. Write Mr. Arthur Mulvey, Room 408, 74 Boylston Street, Boston, for premium lists and entry blanks.

The National Beagle Club of America.

THE fourteenth annual field trials of the National Beagle Club of America, will commence on Nov. 9, at Howardsville, Albemarle county, Va., at the invitation of Dr. and Mrs. Henry Dickson Bruns and General and Mrs. T. M. Logan, on their plantations known as Duncannon and Algoma, where all members of the club and all those making entries will be their guests during the trials.

It is the desire of the club that all members of the club and all persons making entries who expect to attend the trials, will so notify the secretary as soon as possible, and also state the number of dogs which they expect to enter, so that ample accommodations may be arranged.

CHARLES R. STEVENSON, Sec'y.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

- First prize, \$75.00.
- Second prize, \$50.00.
- Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

SIR THOMAS LIPTON has shown a disposition to revive trans-Atlantic yacht races by offering a twenty-five hundred dollar cup for that purpose, the trophy to be a perpetual challenge cup and the races to be sailed from Sandy Hook to the Needles. The contest will be open to sloops, yawls and schooners, and the races to be sailed without time allowance. Sir Thomas suggested that a second prize valued at one thousand dollars be offered by the club accepting his offer. The Atlantic Y. C. will more than likely become the custodian of the cup, as Commodore Tod is very enthusiastic on the subject of ocean races, and has done much to encourage them the past two years.

The German Emperor will soon present to the New York Y. C. a handsome cup, and although the conditions governing the trophy are not known, it is more than likely that it will be offered for ocean races.

Boston Letter.

BOSTON, Oct. 11.—Nearly everything pertaining to yachting in Massachusetts Bay has, at the present time, become a question of rules governing the present restricted classes or those to govern proposed new classes which may, or may not, be adopted at the fall meeting of the Yacht Racing Association of Massachusetts, to be held next Thursday evening. The rules governing the proposed new classes have been published and sent broadcast among the yachtsmen so that any weakness may be discovered and changes recommended before the classes may be actually formed and yachts built for them.

The need of new classes, or some radical changes in the rules governing the rules of the present restricted classes, has been apparent for some time, and particularly so during the past season. At the annual meeting of the Association it was resolved to instruct the Executive Committee to look into the matter of new rules and to report

restrictions to govern any new classes that might be deemed necessary for the Association to adopt. The Executive Committee will recommend at the coming meeting that class D, 25-footers, class E, 22-footers, and class I, 18-footers, be retained, and that three new classes be adopted, the proposed conditions of which were published in the last number of FOREST AND STREAM.

It may seem strange, after such radical types were produced for the 25ft. class in the past season, that the Executive Committee should recommend the retention of the class. It is understood that the members of the committee were not all of one mind in regard to the matter. They were of one mind that the types of boats that have been produced within the past year are undesirable and are far from being what was intended to be produced under the rules. It was realized, however, that several men had invested money in the construction of these boats, in good faith, and that it would be unfair to them to throw the boats out of all racing at a time when they could not be disposed of for racing in other sections of the country, and would hardly be marketable for wholesome cruisers. So the committee recommends retaining the class, believing that nobody will care to invest in any more extreme "slabs" for it, and that the class will die a natural death.

There have been several things that cropped up in the 22ft. class since its formation that were not down on the programme when the class was formed. There was found to be a little mixup between the waterline length and the displacement as against the figures laid down in the rules. This was fixed up, however, by making the rules conform to the boats that had been built, a little irregular proceeding but one that appeared to suit the owners, and the yachts had fairly good racing throughout the season. Both this class and the 18ft. knockabouts—which, by the way, are just as popular as ever—are governed by associations of their own, and would be in on the racing whether accepted by the Association or not.

There are some protests, appealed to the Association in the past season's racing, that have yet to be figured in the percentages for the season. The following official list, issued by Secretary A. T. Bliss, to Sept. 10, will undoubtedly need some changes, but will give some idea of the work of the yachts:

Class D—25-footers.			
	Starts.	Total Per cent.	Average Per cent.
Sally VII., L. F. Percival.....	14	1240	92 1-7
Great Haste, T. K. Lothrop.....	11	775	70 5-11
Chewink III., F. G. Macomber, Jr.....	16	1081	67 9-16

Walada, W. W. Rowse.....	2	40	4
Matillian II., F. L. Woods.....	2	36	3 1-2
Nicknack, E. B. Holmes.....	5	20	2

Crowninshield has an order for a fast steam freight lighter to ply between Brunswick, N. J., and New York city. He has also orders for a six-masted schooner and a three-masted schooner, owners to be announced later.

Burgess & Packard have an order for a 21-footer for Kenneth Stevenson, of Detroit. She will race under the rules of the Country Club. They have also an order for an auxiliary 24-footer for Mr. Holmes, of Plymouth, and have orders for three 18-footers.

At a recent meeting of the Twenty-two Foot Cabin Yacht Association it was voted to increase the minimum freeboard to 23 inches and to reduce the height of the cabin two inches, still preserving the headroom of 4ft. 8in. H. H. White, H. H. Walker and W. H. Joyce were elected judges, all the other officers being re-elected.

Hollis Burgess has sold the 31ft. waterline auxiliary sloop Hostess, owned by J. Murray Forbes, of Milton, Mass., to Robert G. Shaw, of Wellesley, Mass. The Hostess is a fine type of the modern auxiliary, and is equipped with a 20 horse-power Lozier engine of the latest model, capable of driving her at a high rate of speed. Mr. Shaw will use her for cruising and day sailing at Vineyard Haven.

Small Bros. have orders for a 30ft. yawl for E. S. Bell, of North Swansea, a 28ft. auxiliary yawl for H. E. Pratt, of Ocean Park, California; a 21ft. auxiliary yawl for J. H. McCully, of Grosse Pointe, Mich.; a 30ft. yawl for F. Campbell, of Chicago; a 21ft. yawl and a 15ft. yawl for E. J. Kistenmacher, of Davenport, Ia.; a 21-footer for E. Bryan, of Wyandotte, Mich.; a centerboard 18-footer for A. W. Finlay, and a keel 18-footer for Boston parties.

JOHN B. KILLEEN.

Ariadne—Auxiliary Schooner.

THE fine auxiliary schooner Ariadne was designed by Mr. Clinton H. Crane, of the firm of Tams, Lemoine & Crane, and built in 1902 by the Harlan & Hollingsworth Company, at Wilmington, Del., for Mr. H. W. Putnam. Ariadne was designed for off-shore cruising, and is built of steel throughout. All the material and workmanship in the vessel are of the highest quality, and she is to-day one of the very best and most completely fitted cruising yachts of her size in the world.

Her dimensions follows:

Length—	
Over all	145ft.
L. W. L.	110ft.
Overhang—	
Forward	14ft.
Aft	21ft.
Breadth—	
Extreme	26ft. 2 in.
L. W. L.	25ft.
Draft—	
Extreme	14ft. 1½in.
Freeboard—	
Forward	12ft. 6 in.
Least	7ft. 2 in.
Aft	8ft. 8 in.
Tonnage—	
Net	168
Gross	246

A bulwark 2ft. 3in. high gives a sense of security to those on deck; all the waterways, hatches, companionways and skylights are of teak. The deck is of white pine 3in. thick. Below decks the accommodations are very roomy, beautifully fitted and decorated, and well laid out. Every equipment and appliance that would add in the slightest to the owner's and his guests' comfort and convenience have been placed in the boat. The companionway leads directly to the chart room, which is on the port side. The floor is covered with interlocking rubber tiling, and should any water find its way below when the companion slide is open, it does no harm, and can be readily mopped up. The chart room is fitted with a berth, back of which are large drawers, so that the charts can be put away flat. A case for nautical instruments is placed on the after partition of the chart room. There is a port hole directly over the chart table and this gives ample light. A passage extends aft from the chart room to the after cabin. On the port side, aft of the chart room, is a bath room 5ft. 7in. long. Here is a porcelain tub and wash basin and a patent closet. A port hole gives light and ventilation to this room, and the floor and walls are tiled, as are all the bath rooms.

On the port side, aft of the bath room, is a state room, which is the only small one in the after part of the vessel. This room is 6ft. 6in. long and is fitted with a set berth, transom, bureau and set wash basin.

Next aft is the ladies' or after cabin, which runs the full width of the yacht, and is 9ft. long. On the port side is a double berth with a shelf and lockers behind. On the starboard side is a sofa berth and behind there are also lockers and shelves. At the after end of this cabin are wardrobes and clothes presses and a writing desk. Aft there is a private bath for the use of those occupying this cabin. There are skylights over the after cabin and the connecting bath, and these in addition to port holes, make the rooms very light and airy.

Forward of the after cabin, on the starboard side, is a stateroom 8ft. long. This is a roomy cabin, fitted with a double berth, sofa, wardrobe, bureau and wash basin. Between this cabin and the owner's room, which is forward on the same side, is another bath 5ft. 6in. long. This room is fitted very much like all the rest and is accessible from the owner's room and the cabin aft of it.

The owner's room is the largest single stateroom on the boat. It is nearly 12ft. long. This room has a brass bedstead, sofa berth, large wardrobes and clothes presses, a bureau and a desk. Overhead is a skylight, and there are two port holes in the side. On the port side opposite is another stateroom 8ft. 5in. long. This room is arranged and fitted very much the same as are the other single cabins. One port hole and a skylight give plenty of light and air.

The main saloon is 13ft. long and extends the full width of the boat. This cabin is amidships. On either side are two port holes, and there is a very large skylight above. Under the skylight is an extension table. On the starboard side is a sofa, which returns on the forward bulkhead. On the port side is a short sofa with lockers forward and aft of it. In the center of the forward bulkhead is a fire place, and on the port side is the sideboard. At the after side of the cabin are the piano, music rack and a desk.

Just forward of the main saloon is the machinery space, which is entirely surrounded by double steel bulkheads, and the space between is filled with asbestos. On the starboard side of the engine room are coal bunkers and a stateroom for the two engineers. This room is reached from the cook's room, which opens from the officers' mess room.

On the port side of the engine room is a passage which runs from the main saloon forward to the mess

AUXILIARY CRUISING SCHOONER ARIADNE.
Designed by Tams, Lemoine & Crane for H. W. Putnam, Jr.
Photo by James Burton, New York City.

AUXILIARY CRUISING SCHOONER ARIADNE—SAIL PLAN—DESIGNED BY TAMS, LEMOINE & CRANE FOR H. W. PUTNAM, Jr.

room. Opening from the passage is the pantry for the cabin stores. The pantry is equipped with dressers, lockers and shelves, and there is also a sink and an ice box. Forward of the pantry is a coal bunker, which is slightly smaller than the one on the starboard side. Next forward comes a toilet room for the officers. The mess room is of good size, and the deck is reached by an iron companion ladder. On the port side of the mess room are two staterooms, one of which is occupied by two stewards and the other by the two mates. On the starboard side are two more staterooms, one of which is for the captain and the other for the two cooks. Forward of the mess room is the galley, which is of ample size and which extends the full width of the boat. In the galley there is every equipment that would assist the cooks in their work. The placing of the galley between the forecabin and the officers' mess room is an excellent arrangement, the food for the crew being passed through a small opening into the forecabin, and in this way the crew never have occasion to go into the galley. A door opening into the mess room from the galley allows the officers' meals to be easily served, and the officers are thus separated entirely from the crew.

The forecabin has accommodation for twelve men. There is a dresser for the china and also a sink. Each man is provided with a roomy locker for his clothes. Forward is a closet for the crew and locker space for boatswain's stores. Below the cabin floor there is another deck where stores, sails, spare gear, etc., are stored. The boat is heated by steam and lighted by electricity.

The sail plan is of good size, and the boat shows excellent speed under sail alone. Ariadne's engines were built by J. W. Sullivan, and are of the two cylinder type, 9in. and 19in.-14in. She has two Almy water tube boilers. After two seasons' constant use Ariadne has proven herself a very satisfactory craft in every particular.

In a Cornish Lugger.

A FAVORITE dream of mine has been realized. Time after time I had watched the fine Cornish luggers setting out for the herring fishery, and vainly longed to accompany them; now, thanks to a friend, an enthusiastic sailor and lover of the sea, my pet scheme was rendered feasible.

All arrangements having been made, we presented ourselves at the quay one beautiful August afternoon about 4:30, attired in our warmest clothes, as every one had warned us that even in August night fishing was apt to chill the unaccustomed landsman. I carried the oilskin coat and skirt which accompanied me on all my boating expeditions, and long, fingerless, woolen mittens, warmer than any gloves. We stepped from the quayside on board 404 PZ Pride of the Sea, and were greeted by the skipper, a gentle-mannered little old man, with mild blue eyes and a pleasant countenance. Half an hour passed while we waited till the tide should serve, and meanwhile

we were objects of much curiosity and speculation on the part of the crews of the other luggers, as to whether we were going for a short sail or the whole night. At last the foremost boat moved away through the swing-bridge ahead of us, then our halliards were manned, the big lug-foresail was mastheaded, the mizzen set, and we followed suit.

The wind was light, and scarcely filled the sails as the little town slowly dropped astern, and we opened out the various promontories and headlands along the coast. After a couple of hours' sailing we had made an offing of five or six miles, and as the sun was just setting, the skipper considered that the distance from the land was sufficient, and that the nets might be sent overboard. Then the night's work began. The hatches were taken off and the mass of dark nets was passed along and dropped overboard, one man making fast to it small tarred barrels, alternately with strings of corks, to act as floats. This was the only time that we noticed any disagreeable smell from the nets, the result of their having been shut up in the hold.

The tall foremast being lowered to an acute angle, in order to lessen the rolling, two lanterns were fixed, one above the other, in the rigging, and the preparations were complete. By this time it was 9 o'clock and quite dark. The skipper, the boy, and three out of the four men composing the crew went below and turned in, not, however, without overwhelming us with offers of knitted guernseys, mittens, oilskins, coats, etc., but we declined, being already well provided. One man remained on deck as lookout, to be relieved by the others in turn. We now had to while away four hours as best we might. It was a beautiful night, clear, and full of stars, and each little sea curled over in a shimmer of phosphorescence. All along the coast for miles the lights of the various towns and villages shone like clusters of diamonds, and one, bigger than the rest, showed where a lighthouse kept watch on a rocky promontory, but the loom of the land was indistinguishable. Other lights, red, green and white, came and went around us, for we were well in the fairway of the North Sea traffic. All this time the boat rolled steadily and monotonously, but it was too early as yet to be sleepy, in spite of the pleasant cradling motion; so we passed the time in conversation and in watching the lookout man fishing, unsuccessfully, alas! with a hand-line for cod. The time had passed so quickly that it seemed as if but two hours instead of four had elapsed, when the skipper's voice was heard below, "Now, lads, time's up," and the crew tumbled up on deck and began preparations for getting the nets on board.

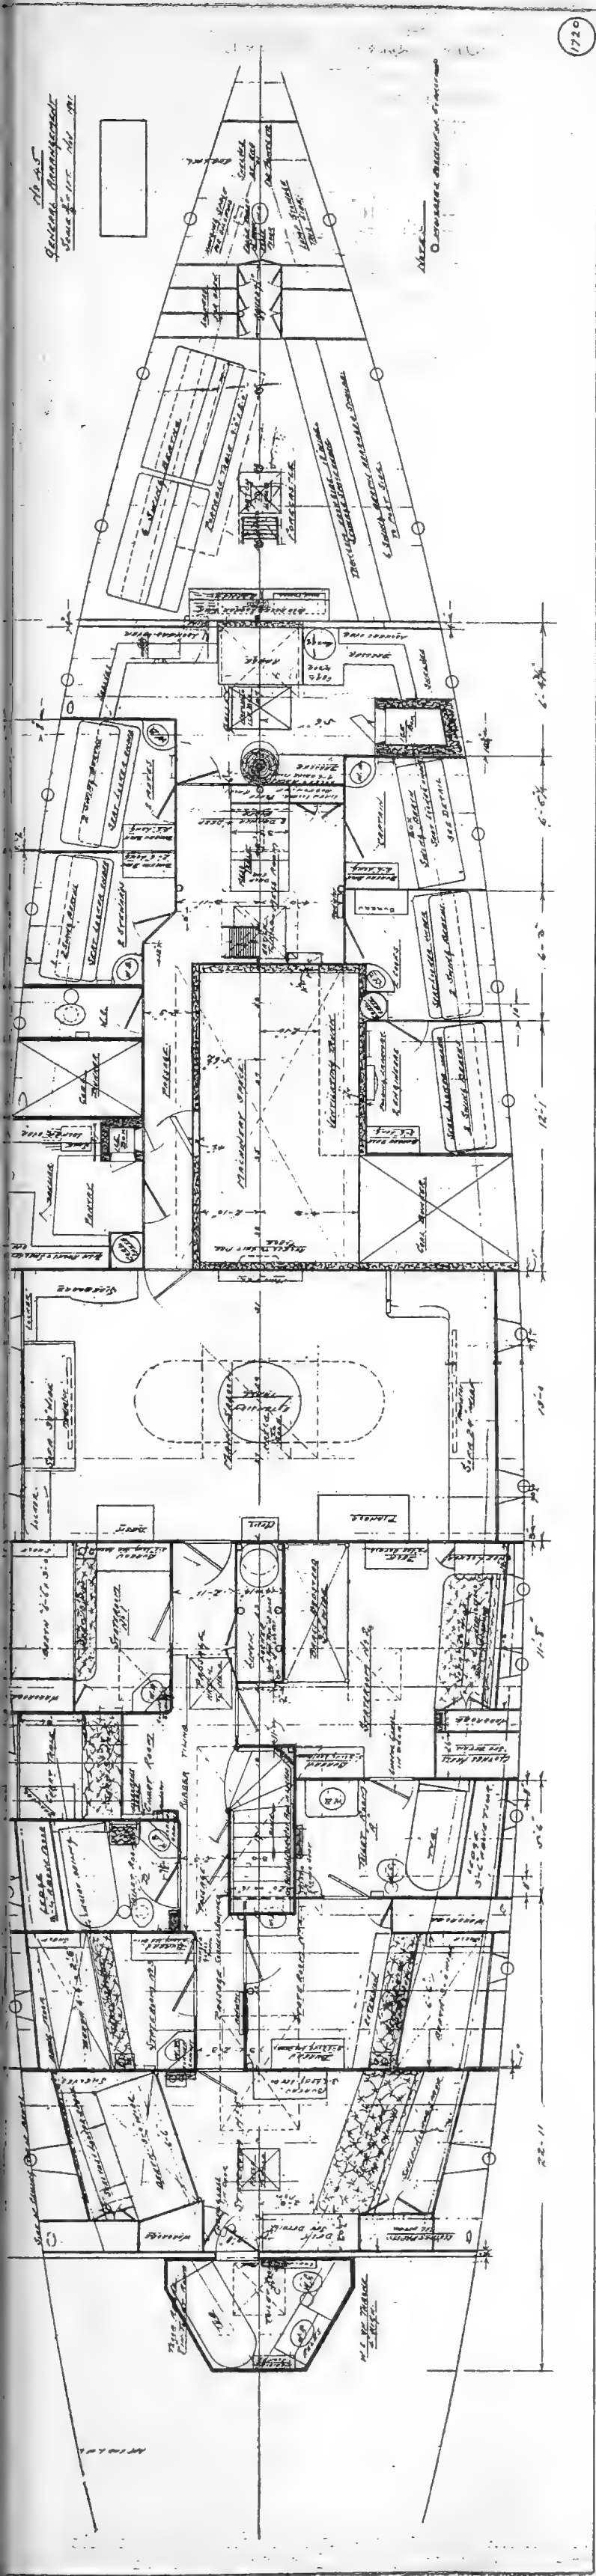

First the steam capstan was set going, and then the skipper disposed his forces in the following manner: One man was sent into the forehold, and another into the hold amidships; the skipper and a third man stood beside the gunwale and hauled in the net, shaking the fish out of the meshes on to the deck; the fourth man sat beside us on the opposite gunwale and hauled in the slack. And presently the net began to come in, hung all over with silvery herrings; in fact, it reminded me of

nothing so much as a net ball dress covered with silver sequins. The men in the hold received it, and disposed it evenly, so as to keep the boat in proper trim; they also tossed out on to the deck any stray fish that had escaped the hands of the skipper and his mates above. Soon the deck was a mass of fish, and looked as if it were covered with heaps of solid silver. The men worked almost in silence, only exchanging a word at rare intervals. Hour after hour passed, and still the laden net came in, and the stillness was only broken by the purring of the steam on the water alongside, the slap of the fish falling upon the deck, and the regular creaking of the boat as she rolled. More than once my friend and I found ourselves nodding forward off the pile of oars and tarpaulins on which we were seated, although we never entirely succumbed to sleep.

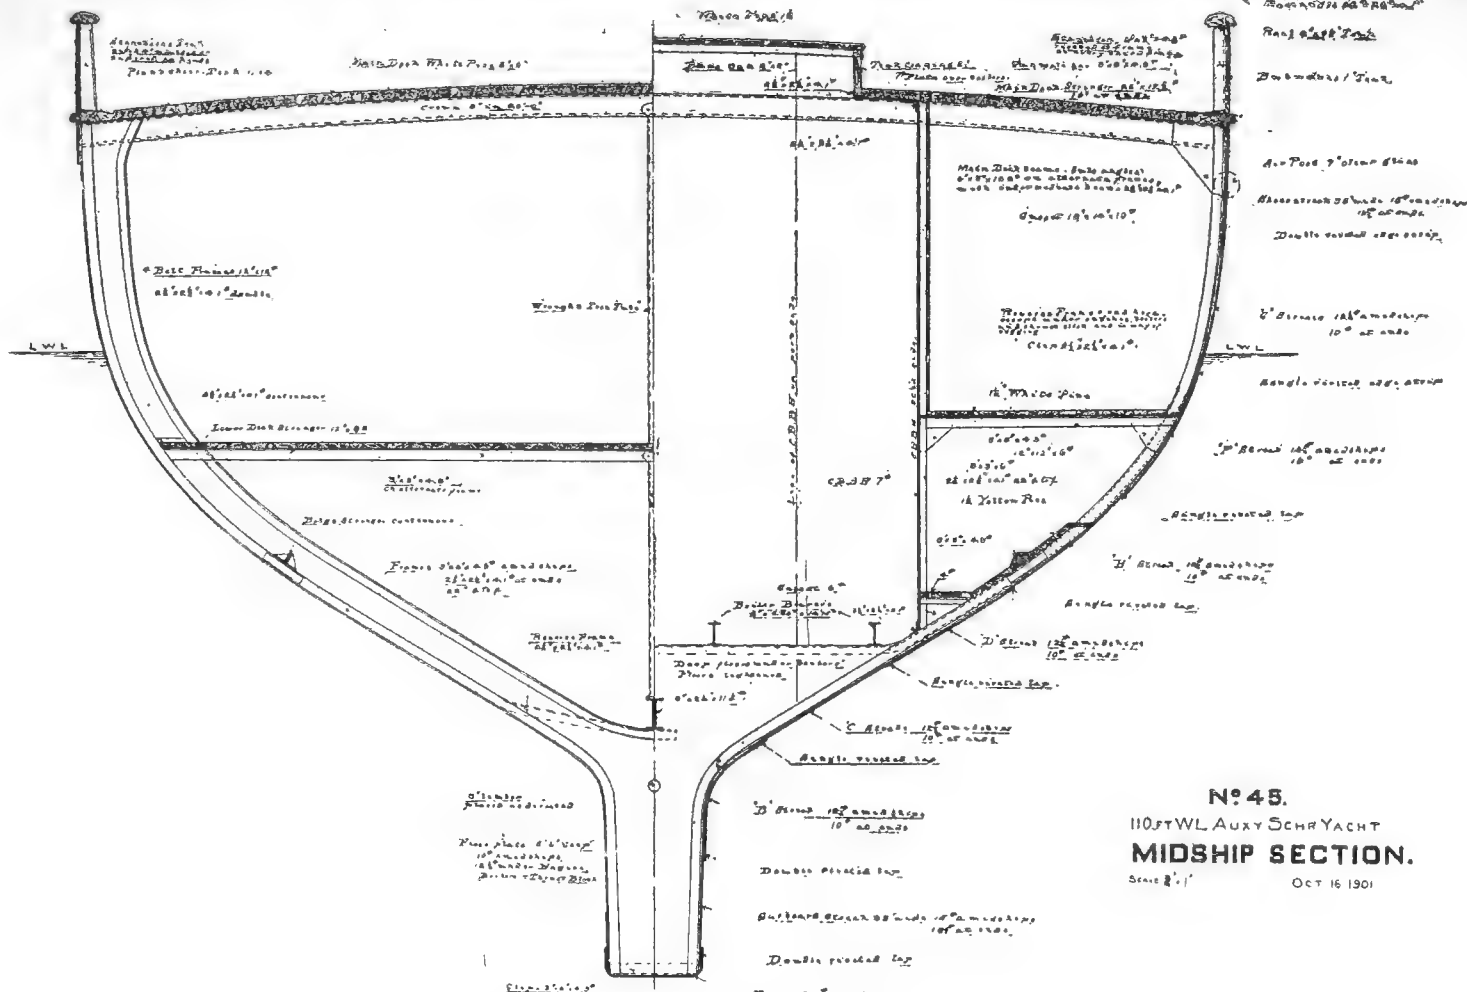

Gradually the blackness of the sky changed to ash color, and away on the dappled surface of the gray water a long line of black dots became faintly visible, the barrel-shaped floats along the top of the nets. From ash color the sky soon turned to a vivid pink, and in the midst of this beautiful flush rose the sun. A light breeze sprang up, and numbers of gulls and kittiwakes came flying round the boat with shrill cries, looking for their breakfast. I glanced down at the hold; it looked nearly full, but all the nets were not in yet; indeed, it was past six before they were all stowed away and the hatches put on, and a goodly heap of fine herrings showed the result of the night's fishing to amount to more than a last (10,000 herrings), which the skipper considered a very fair catch. Meanwhile, word had been passed below to get the kettle boiling, and smoke began to pour from the galley chimney.

The foremast having been restored to an upright position, the foresail was set, the small riding-mizzen exchanged for a much larger one, and we were once more under way for home. Mugs of hot tea were passed up to us from below, a welcome sight, though I confess that it was not without misgiving that we ventured to taste the beverage, as yarns had been plentiful ashore of the Cornish fisherman's cookery, how plum puddings were occasionally boiled in the soup kettle, with the soup, *bien entendu*, but experience proved our fears to be groundless. After breakfast, buckets of water were capsized over the decks, which were carefully scrubbed wherever there was a space clear of fish. Cornish fishermen have a deservedly high reputation for the cleanliness and good order of their boats, and this boat was no exception to the rule. But, alas! our enjoyable trip was nearly over. At 7:30 o'clock, fourteen hours after our departure the day before, we sailed in between the pier heads and made fast to a buoy in the harbor, thus bringing to an end a most delightful experience, and one which, as we assured the skipper on bidding him good-by, we hope some day to repeat.—Pall Mall Gazette.

Mr. Hollis Burgess has sold the 31ft. waterline sloop Hostess, owned by Mr. J. Murray Forbes, of Milton, Mass., to Mr. Robert G. Shaw, of Wellesley, Mass.

AUXILIARY SCHOONER ARIADNE—DESIGNED BY TAMS, LEMOINE & CRANE FOR H. W. PUTNAM, JR.

AUXILIARY CRUISING SCHOONER ARIADNE—MIDSHIP SECTION.
Designed by Tams, Lemoine & Crane for H. W. Putnam, Jr.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.
Messrs. Edward Smith & Co., the well-known varnish makers, have gotten out a picture of Reliance that is one of the handsomest marine views that we have ever seen. The picture, which is 16 by 21 inches, is a reproduction of a photograph and shows Reliance close-hauled on the port tack.

Small Bros. are getting out plans for a 30ft. yawl for E. S. Bell, of North Swansea, a 28ft. auxiliary yawl for H. E. Pratt, of Ocean Park, California; a 21ft. auxiliary yawl for J. H. McCully, of Grosse Pointe, Mich.; a 30ft. yawl for F. Campbell, of Chicago; a 21ft. yawl and a 15ft. yawl for E. J. Kistenmacher, of Davenport, Ia.; a 21-footer for E. Bryan, of Wyandotte, Mich.; a centerboard 18-footer for A. W. Finlay, and a keel 18-footer for a Boston yachtsman.

Frederick T. Adams has resigned as commodore of the Larchmont Y. C. Commodore Adams' resignation has been in the hands of the Board of Trustees for some time past, and it has not been accepted as yet. Mr. Adams was elected Commodore of the club in 1901.

At a meeting of the Royal St. Lawrence Y. C., held on the evening of October 6, the challenge sent in by the White Bear Y. C., of St. Paul, Minn., for the Seawan-haka cup was accepted. Four clubs issued challenges for the cup, and it was first proposed to hold races between the boats representing the different clubs at Lake St. Louis, and the winner of the series would sail against the Canadian defender. As this plan was believed to be contrary to the letter and the law of the deed of gift, it was abandoned, and a single challenge was accepted, as has always been done.

Messrs. Burgess and Packard have orders for three 18-footers, a 21-footer for Mr. Kenneth Stevenson, of Detroit, and a 24ft. auxiliary for Mr. E. Holmes, of Plymouth, Mass.

Mr. C. Oliver Iselin is to have a large sail or auxiliary yacht built this winter for off-shore and foreign cruising.

Canoeing.

CANOEING NEWS NOTES.

The Northern Division of the A. C. A. elected the following officers during the annual camp at Sugar Island in August:

Vice-Com., C. W. McLean, 303 St. James Street, Montreal, Can.; Rear-Com., J. W. Sparrow, Toronto, Can.; Purser, J. V. Nutter, Montreal, Can.; Executive Com., Charles E. Britton, Gananoque, Can.; S. W. Gilroy, Smith's Falls, Ontario, Can.; Harry Page, Toronto, Can. Racing Board, Ernest J. Minnett, Montreal, Can. J. N. MacKendrick, Galt, Ontario, Can., represents the Northern Division on the Board of Governors.

A. C. A. Membership.

The following have applied for associate membership to the A. C. A.:

Proposed by N. S. Hyatt: Mrs. N. S. Hyatt, Ossining, N. Y., and Mrs. Greswell, London, England.

Proposed by Jesse J. Armstrong and John S. Wright: Mrs. J. H. Plummer, Miss Reichert, Miss Shea, of New York; Mrs. Armstrong, Miss Armstrong, Rome, New York, and Mrs. C. H. Parson, of Brooklyn.

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 24, 1903.

C. F. WOLTERS,
Commodore-Elect.

JOHN S. WRIGHT, Secy-Treas.

Rifle Range and Gallery.

Old Guard Tournament.

THE rifle tournament of the Old Guard Rifle Club, held in conjunction with the Old Guard Fair, Madison Square Garden, New York, as originally announced as to dates, was to have been held Oct. 5 to 10, inclusive, but Monday, Oct. 12, was added, and the tournament was finished on that day.

In the Continuum match, the prizes were as follows: First prize, a Hunter Arms Co. shotgun, value \$80; second, \$35; third, a Krag rifle, with Stevens-Pope barrel, value \$35; fourth, a Winchester military rifle, value \$26; fifth, a split-bamboo fly-rod. And there were twenty cash prizes ranging in value from \$12 to \$2.

The prize in the Souvenir point target match was a souvenir medal.

In the Ladies' Souvenir match, the prize was a beautiful hat.

In the 50-shot Individual Interscholastic match, the prizes were as follows: A handsome cup, suitably engraved, and the championship, to the winner; second prize, a Winchester military rifle, value \$26; third, a Remington Arms Co.'s repeating rifle, value \$20; fourth, an Iver Johnson revolver, value \$12; fifth, a Stevens Favorite rifle, value \$8.50; sixth, a Stevens-Maynard, Jr., rifle, value \$3, and \$3 in value to seventh, eighth, ninth and tenth.

In the revolver matches, Match A had prizes as follows: First prize, a Winchester military rifle and \$10; second, a Colt .38cal. military revolver and \$5; third, J. H. Lau & Co. shotgun, value \$20; fourth, a Remington single-shot target pistol, any caliber, value \$16; fifth, a King Edward coronation medal.

Match B had prizes as follows: First prize, a Smith & Wesson .38cal. Military revolver and \$15; second, a Winchester rifle, value \$26; third, a King Optical Co. telescope; fourth prize, a Hopkins & Allen ivory handle target; fifth, \$5 or its value in merchandise.

In their circular the Old Guard Rifle Club acknowledged donations from Smith & Wesson, Colt's Arms Co., Stevens Arms Co., Hunter Arms Co., Iver Johnson Co., Hopkins & Allen Co., J. H. Lau & Co., Peters Cartridge Co., Col. Leslie C. Bruce, Julius King Optical Co., Ideal Manufacturing Co., Thomas Conroy, Winchester Arms Co., George E. Conley, Le Roy W. Taylor, Harrington & Richardson, J. W. Johnson & Co., Remington Arms Co.

The members of the Range Committee were Col. Leslie C. Bruce, chairman; Capt. Thomas W. Timpson, Lieut. Thomas H. Keller and Sergt. James McNevin.

The members of the Prize Committee were Lieut. J. W. Miller, Lieut. Lee R. Townsend and Lieut. Thomas H. Keller.

The members of the Programme Committee were Capt. J. C. Summers, Lieut. Thomas H. Keller and Sergt. James McNevin.

The official scorer was Mr. Geo. W. Plaisted.

Continuous rifle match, 3-shot scores, 25-ring target, the two best scores to count; all ties decided by the next best score:

Cincinnati Rifle Association.

CINCINNATI, O.—At our annual prize shoot on Sept. 27, the following is a list of winners. The shoot in every way was most successful. Shooting at 200yds., on Standard target, three shots to a ticket:

Offhand: First prize, E. D. Payne; second, M. Gindele; third, F. Bruns; fourth, C. Roberts; fifth, Wm. Hasenzahl; sixth, A. Lux; seventh, D. K. Dodge; eighth, C. Nestler; ninth, L. O. Odell; tenth, S. F. Trounstein; eleventh, F. Freitag; twelfth, A. Drube; thirteenth, J. Hoffman; fourteenth, H. W. Kotter, Sr.; fifteenth, G. Hofer; sixteenth, W. Cantzler; seventeenth, G. Kotter, Jr.

Rest: First prize, J. Hoffman; second, C. Nestler; third, M. Gindele; fourth, Wm. Hasenzahl; fifth, F. Freitag; sixth, G. Hofer; seventh, O. Topf; eighth, S. F. Trounstein; ninth, H. Uckotter; tenth, G. Uckotter; eleventh, W. Cantzler; twelfth, A. Lux; thirteenth, L. O. Odell; fourteenth, A. Drube; fifteenth, J. Morkart.

For most points: First prize, C. Roberts, 2,534 points; second, E. D. Payne, 1,777 points; third, V. K. Dodge, 1,276 points.

For most flags: C. Roberts 41.

For best ticket: E. D. Payne.

Premiums for most points, offhand: C. Roberts.

For most points: First prize, J. Hoffman, 1,201 points; second, F. Bruns, 1,061; third, O. Topf, 833.

For most flags: J. Hofman 46.

For best ticket: J. Hofman.

Trapshooting.

Fixtures.

Oct. 14-15.—Baltimore, Md.—Ninth annual tournament of the Baltimore, Md., Shooting Association; targets and live birds; \$100 added; open to all. J. R. Malone, 2671 Penn. avenue.

Oct. 14-17.—West Baden, Ind., Gun Club tournament; \$500 added. John L. Winston, Mgr.

Oct. 15.—Batavia, N. Y.—Holland Gun Club annual fall tournament.

Oct. 20.—Mt. Sterling, Ill., Gun Club's eighth annual target tournament. J. Breidenbend, Sec'y.

Oct. 21-22.—Raleigh, N. C.—Third annual trapshooting tournament North Carolina State Fair; \$150 added money. R. T. Gowan, Sec'y.

Oct. 20-22.—Paducah, Ky., Gun Club tournament. W. A. Davis, Sec'y.

Oct. 23-24.—New London, Ia., Gun Club tournament. Dr. C. E. Cook, Sec'y.

Oct. 23-25.—St. Louis, Mo.—Combination live-bird and target shoot at Du Pont Shooting Park. Open to all. Special event, 50 live-bird handicap. Alec D. Mermod, Mgr.

Oct. 26-31.—French Lick Springs, Ind.—First grand tournament of the National Gun Club; \$500 added. John M. Lilly, Pres.

1904.

Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

The New York Athletic Club will hold a shoot at Travers Island on Oct. 17.

The Hudson Gun Club, of Jersey City, will hold a shoot on Oct. 18, which will be honored by the attendance of the Wanderers.

At the Harrisburg, Pa., tournament, Oct. 9 and 10, the Carlisle team of four men were victors by a score of 79 out of a possible 100.

In an eleven-man team contest at Pattenburg, N. J., Oct. 3, between teams of the Pattenburg and Norton gun clubs, the scores were: Pattenburg 183, Norton 166.

At Messrs. Whitney and Milner's two-day target tournament, Des Moines, Ia., Messrs. Heer and Crosby tied on highest average, 361 out of 400, for the two days, Oct. 6 and 7.

Mr. Frank Lawrence, representing the Winchester Arms Co. in Pennsylvania, has made himself doubly welcome in his territory for his amiable disposition, business ability and cheerful assistance in the somewhat irksome task of helping to manage the tournaments whenever he can do so.

Mr. J. S. Coggeshall, the energetic secretary of the Aquidneck Gun Club, of Newport, R. I., was a visitor in New York in the early days of this week. He reports that trapshooting in his section is inactive during the present weeks, as is usual everywhere during the game season.

The manager of the Brooklyn, L. I., Gun Club, Mr. J. S. Wright, informs us that his club will give a prize shoot on Oct. 28, commencing at 1 o'clock. Some vandals, without the fear of man in their hearts, broke into the club house recently and stole a lot of shells, which severely tarnishes the erstwhile fair fame of Brooklyn.

The Sheepshead Bay, L. I., Gun Club has fixed upon Oct. 21 for a contest of great interest. It is a handicap at 100 targets for a gold watch, entrance price of targets. This same event will have an optional sweep, entrance \$1, all at scratch, for a gold watch. This should draw a good support from the shooters of New York and New Jersey.

The shoot of the Western Pennsylvania Trapshooters' League, at Allegheny, Oct. 6 and 7, closed a most successful series for this season. Mr. J. M. Hawkins was highest average, with a total of 322 out of 350. Mr. L. B. Fleming was close up with 321, and J. F. Mallory was third with 312. R. S. Deniker was fourth with 311, and F. E. Mallory was fifth with 307.

Highest target average at the Missouri State Amateur thirteenth annual shoot, held at St. Joseph, Oct. 8-10, was won by the redoubtable expert, Mr. W. R. Crosby, who broke 384 out of a possible 400, on the first two days. D. Timberlake won the Lake Contrary trophy. The two-man team contest for the Smith cup was won by Messrs. Cunningham and Clapp. Moberly was fixed upon for the next tournament and meeting.

Mr. Robert J. Hopkins, secretary of the Fairview, N. J., Gun Club, writes us as follows: "The Fairview club is open to shooters on the second Saturday of each month, and we welcome any and all out-of-town sportsmen who may wish to shoot, or shoot at, a few targets. We are only about twenty minutes out of city by N. R. of N. J., and about thirty minutes by trolley from Barclay, Christopher, Franklin, Forty-second and Fourteenth street ferries. Fare 5 cents, so that a pleasant afternoon among good fellows is within the reach of any wing shot who feels as though he didn't start with the topnotchers."

Our esteemed correspondent, Snaniweh, Poughkeepsie, N. Y., writes us as follows: "On the 3d inst., our secretary, A. J. Du Bois received a letter under date of Sept. 4 from U. S. Marshal Geo. A. Derby, secretary of the Sportsman's Gun Club, Shanghai, China, stating that he had been watching our scores as published in FOREST AND STREAM, and asking for information concerning our system of handicapping as used in our trophy shoots. This shows to what extent a gun club, publishing its scores in FOREST AND STREAM, becomes known and advertised, the value of which cannot be over-estimated."

Brooklyn Gun Club team No. 1, the members of which were Messrs. Brigham, Banks and Hopkins, won the Eastern team target championship inaugurated by the Sheepshead Bay Gun Club, and shot on that club's grounds, Oct. 7. They scored 126 out of a possible 150. Eight teams contested. The North River Gun Club team, the members of which were Messrs. Welles, Glover and Richter were second with 124. The Brooklyn Gun Club and Sheepshead Bay Gun Club had two teams each, while each of the following had one: Hudson Gun Club, of Jersey City; North River Gun Club, of Edgewater, N. J.; South Side Gun Club, of Newark, N. J., and the White Plains Gun Club, New York.

The third annual trapshooting tournament, North Carolina State Fair, Raleigh, N. C., Oct. 21 and 22, will be conducted by the Raleigh Gun Club. Programmes can be obtained of the secretary, Mr. R. T. Gowan, to whom guns and shells may be shipped. There are seven programme events on each day, at 15, 20 and 25 targets. No. 11 first day is for a L. C. Smith hammerless. No. 11 on the second day will be the State championship contest, at 100 targets, \$2 entrance. Each day \$75 will be added. A prize will be given to the manufacturer's agent who makes the highest average of the two days. Handicaps 16 to 21yds. Manufacturers' agents may stand at 16yds. Moneys will be divided 40, 30, 20 and 10 per cent. A magautrap will throw the targets. Targets, 2 cents. The State event is open to North Carolina shooters. Shooting will commence at 9:30.

BERNARD WATERS.

As to Official Organs.

THERE are many men, in all grades of society, who, as individuals, or who, collectively as members of groups in joint effort, possess a fund of humor, airy, sparkling, pleasing, delicate in its web and woof, and withal inexhaustible in its supply. But even among humorists, there are those who surpass their fellows. There are those who are so finished as dispensers of humor that in its practical manifestation, they never choose amiss at any time, or place, or occasion, whether at wedding or funeral, whether of church or State, or whether in town or country.

There are those who excel in the humor of high lights which contributes to the gayety of nations; there are a few of special talents who excel in the humor of somber lights, the humor which strips all seriousness from the moribund and the mort, and instead makes them light and pleasing after the manner of the best of comic operas. Here is a specimen of the Illinois State Sportsmen's Association humor, evolved by the delegates assembled at the annual meeting of 1903, at Pekin, Ill:

"John Amberg then brought to the notice of the convention that as there was a 'Tramp' reporter present and as he was the only representative of a sportsman's paper present, that The Sportsman, of St. Louis, should be made the official organ of the association. This was seconded by the fluent and silver-tongued orator, 'Our Tom,' who stated that 'The Tramp' had been on earth for 101 these ninety years or more and that he was one of the old school, like Bogardus, and that it was proper that we here assembled should recognize him in a substantial way. That we should not only make the paper he was associated with the official organ, but should all subscribe and read the journal that had enterprise enough to send a representative to report the meeting. The motion was unanimously carried, and the 'Tramp' arose and thanked all for their kind words and appreciation."

The genial Tramp, able trap editor of our esteemed contemporary, saw the humor of the situation, and modestly presented his doings by way of reply as follows:

"He took occasion to invite all the readers of the The Sportsman to consider him at their service when they were in need of hotel accommodations during their stay at the World's Fair, as The Sportsman intends to conduct a bureau of information during 1904."

What could be more pertinent in the way of a reply to so great an honor as to be made the official organ of such a brilliant assemblage of humorists. That "Tramp" was perfectly conscious of the situation, is manifested by the following delicate bit of innuendo which he made a part of his report of said meeting:

"As there were no books or papers turned over by the party who held the last shoot, the fact was patent that the organization was practically a dead one."

That is gravely humorous. But the tramp had still further founts of humor. He wrote:

"Mr. Shafter moved that the old association be abandoned, which was seconded. In arguing the question the Mayor of Keithsburg grew somewhat eloquent and then took occasion to state that he was opposed to State taxation of shooters living in another State, and that the only proper legislation should come from Congress, and that there would be use for the old and at one time powerful organization that in the past had accomplished so much for the members and the residents of Illinois."

The late Gov. Altgeld, of Illinois, also had some excellent ideas of a humorous kind on game protection, supplementary to the foregoing.

The badge events, which, from several hundred entries, had fallen down to 18 and 20 under the able management of humorists, were patched up so that they will be handicap events in future.

The official duties of an official organ this year would have been light, merely to mention that dates had been claimed, dates had been postponed on account of the official papers being unavailable, and new dates announced. The humorists passed a vote of thanks to President Connor. To have thanked the other journals, which had given this shoot mention in advertising its dates, in supporting it during the years of its past existence, in reporting its shoots through those years and in the present year, etc., would have shown a sense of humor in keeping with things alive instead of with things dead.

ON LONG ISLAND.

Sheepshead Bay Rod and Gun Club.

Sheepshead Bay, L. I., Oct. 7.—Eight teams engaged in the Eastern three-man team championship, inaugurated by the Sheepshead Bay Gun Club and held to-day. The scores were not high as scores, yet the best are quite good under the conditions. There was a stiff wind, which forced the targets erratically upward or downward, and the traps worked badly. They were keyed up rather tensely, but, the events once begun, they were allowed to remain as they were to preserve a proper equity.

Brooklyn Gun Club team No. 1 won on a score of 126 out of a possible 150. The North River Gun Club's team was a close second with 124. The scores, 50 targets per man, follow:

Hudson Gun Club.				Brooklyn Gun Club, No. 1.			
Schorty	23	20	43	Martin	23	20	43
Wash	22	21	42	Hopkins	22	20	42
Piercy	20	20	40-125	Banks	18	23	41-126
North River Gun Club.				Brooklyn Gun Club, No. 2.			
Welles	23	20	43	Gardiner	20	21	41
Richter	23	15	38	Money	20	18	38
Glover	21	22	43-124	Greiff	15	20	35-115

W. P. T. S. L. at Allegheny.

ALLEGHENY, Pa., Oct. 7.—The closing tournament of the Western Pennsylvania Trapshooters' League, held under the auspices of the North Side Gun Club of Allegheny, Pa., on Oct. 6 and 7, marks the close of the most successful trapshooting season in western Pennsylvania, and the promoters of the league may well feel proud of their efforts to boom a sport which has been absolutely dead in this section for many years.

The North Side shooters had expected better attendance from the various clubs in the league, as they had by far the most entries in the series of tournaments during the entire season. Both New Castle and Ligonier Gun clubs failed to send a single shooter. However, the tournament was a grand success and one of the best ever held in western Pennsylvania.

Shooters were present from Brownsville, Corry, Ruffsedale Du Bois, Irwin, Blairsville, Derry, Parkersburg, W. Va., and Liverpool, and Ravenna, Ohio. The trade was represented by J. M. Hawkins, J. S. Fanning, Frank Butler, Charles G. Grubb and Chas. North.

In the cashier's office were L. Lautenslager and Bill McCrickart, while A. S. Hollingsworth, of Derry, handled the score sheets. Frank Butler was an ideal referee at trap No. 2, and Charlie Grubb made himself useful in general. Chas. North kept an eye on the magautraps and hustled squads at the same time. L. B. Fleming, who managed the tournament, wishes to thank the above gentlemen for their valuable assistance, as it was largely due to their untiring efforts that the shoot was run so smoothly and rapidly.

Tuesday morning opened with very disagreeable weather, being very dark with a drizzling rain falling. However, the weather did not scare the shooters in the least, and by 9 o'clock there were plenty of them on the grounds. By this time, it had stopped raining. At 10 o'clock the "Mallory Squad" started event No. 1. During the day forty-four shooters faced the score and 6,310 targets trapped. A stop of one-half hour was made at noon for lunch, and the programme was finished at 3 o'clock.

High average for the day was made by L. B. Fleming, of the North Side Gun Club, who broke 166 out of 175. J. M. Hawkins, of Baltimore, finished second with 164. F. E. Mallory, of Parkersburg, third, with 162, and H. C. Watson, of Sewickley, fourth, with 160. In practice, before the programme was started, Hawkins broke 101 straight, and in the regular events he had a run of 71 without a miss.

On Wednesday morning a fierce wind was blowing from the south, papers and boxes were blown across the grounds and targets were anything but easy to hit. Considering the weather, the scores were very good, as the wind kept blowing during the entire day.

Oct. 7, Second Day.

Shooting started the second day at 9:15 A. M., and as many of the shooters wished to take in the ball game between Pittsburg and Boston, things were kept moving at a rapid gait. The programme was finished at 2 o'clock, even though a delay of 20 minutes was occasioned by the breaking of a saddle on one of the traps.

Forty-four shooters again faced the traps; the same number as on the first day, and 6,425 targets trapped. During the two days, counting practice shooting, 14,000 targets were thrown. High average the second day was made by J. F. Mallory, of Parkersburg, with 160 out of 175. J. S. Fanning second, with 159; Hawkins third, with 158, and Fleming fourth, with 155. For the two days J. M. Hawkins led with 322 out of 350. L. B. Fleming second, with 321; J. F. Mallory third, with 312; R. S. Deniker fourth, with 311, and F. E. Mallory fifth, with 307.

Each of these men received \$5 as average money. The North Side team, composed of Fleming, Jeff Watson and Kelsey, won the team shoot, which gives their club first place and title of champions of the Western Pennsylvania Trapshooters' League. The scores follow:

	First Day.		Second Day.		Total	
	Shot at.	Broke.	Shot at.	Broke.	Shot at.	Broke.
Hawkins	175	164	175	158	350	322

C. A. North	20	10	20	10

The North Side boys turned out in great shape. Those who took part in the shoot were Fleming, Watson, Deniker, Knodel, Kelsey, Andrews, Bessemer, Pontefract, Howard, McGlashan, Henry G., Tony, Jeff, Pyle and Brown. The "Mallory" squad, consisting of F. E., S. T. and J. F. Mallory, J. W. Stewart and C. J. Mowry, were always ready at the score. They said nothing but sawed wood—and they can saw some at that. Lou Fleming, although hustling all the time, managed to land within one target of high average.

Jack Fanning has not yet rested up from his ten months' trip, as the scores will show.

FOREST AND STREAM.

Harry Watson, the Sewickley Valley wonder, was not in his usual "snappy" form. He still wears Ed. Rike's coat.

Frank Butler certainly knows how to referee. His decisions were prompt and correct.

Dick Deniker, the war horse of Ruffsedale, as usual, landed near the top of the bunch.

Charlie Grubb found an occasional moment to talk—and eat chicken.

Of the 53 entries who shot during the two days, but three men—Fanning, Hawkins and North shot for targets only.

Flick, the one-armed shot of Ravenna, Ohio, tried a new gun. He smashed 20 straight and bought the gun.

J. M. Hawkins made many new friends by his pleasant and gentlemanly manners. The North Side Club came out exactly even, financially, on the tournament. They were not out for the coin.

Harrisburg Tournament.

THE sixteenth annual tournament of the Harrisburg Shooting Association was held at Harrisburg, Pa., Oct. 9 and 10. Like all late fall tournaments, a chance has to be taken with the weather man; and this time he won, for on those two days the sky was of the dark, cold, wintry kind. Also a gale of wind, such as the writer has not seen at any shoot this season, blew continuously for the two days, accompanied by rain about half the time.

There are but few cities that could turn out as many shooters as Harrisburg did at this shoot, under the same weather conditions.

The trade was well represented, there being present Mr. J. A. R. Elliott, J. M. Hawkins, Frank Lawrence, L. J. Squier, J. R. Hull, E. D. Fulford, Harry H. Stevens and N. Apgar.

Nearly fifty different shooters participated. One of the features was a team shoot for cash prizes; no entrance fee; open to any gun club in the State; four men to the team; 25 targets per man; for \$85 in cash, to be divided among the four highest teams, 40, 30, 20 and 10 per cent. The club donated this money instead of putting up a cup, which has been the custom.

Although the weather was the worst ever, everything moved off in good shape, thanks to the good work done by Mr. A. H. Roberts, the club's secretary, and by Mr. Frank Lawrence, the manager of the shoot. Everybody was willing to lend a helping hand, and the shoot was pronounced a success. The scores follow:

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, Ill., Oct. 10.—The appended scores were made on our grounds to-day on the occasion of the fourth shoot of the fourth series. Dr. Meek carried off the honors of the day by winning Class A trophy on 25 straight, while Dr. Huff captured the jewelry in Class B on 19. L. Wolff did the trick for Class C on 15.

The day was an ideal one for target shooting, being cool and just a slight breeze from the rear. The attendance was not what it should be, but that is accounted for by the open season for game.

Trophy shoot, 25 targets:

Wilson	11110101111100111101101111—19
Thomas	101111111111111101101111—21

Nevada Annual Shoot.

NEVADA, Mo., Oct. 10.—The Nevada Gun Club held their annual shoot at Lake Park, Oct. 7 and 8. It was a success from every standpoint. The weather was fair, with the exception of a flurry of wind occasionally. The club was favored with the presence the first day of Mr. and Mrs. Butler, of Chanute, Kan., and with the short while which Mrs. Butler has been following the trap, she made the old heads "go some."

The second day was not so well attended, but some very fair scores were made.

The club is indebted to the big-hearted Dave Elliott (brother of J. A. R.), of Kansas City, for his untiring help through both days, as his ambition any time is to work rather than shoot in order to keep everything moving.

The first day's shoot resulted in Mr. Gresham, of Mineral, Kan., being high man, with 143 targets, being close run by Mackie, of Scammon, Kas, with a total of 142.

The second day ended, Gresham was 126, Mackie 129, leaving Mackie high gun on the two days by a margin of 2 targets.

Oct. 7, First Day.

Rylands (Ky.) Shoot.

RYLANDS, Ky.—A party of enthusiastic sportsmen and active members of the Cincinnati Gun Club visited Rylands on Oct. 9 and spent a most enjoyable day at the traps. The shoot was to have been held on the 8th, but owing to the non-arrival of the pigeons in time for the morning train, it was postponed. Superintendent Arthur Gambell and a few others went down in the afternoon of the 8th to get everything in good shape for the main party, and, as the birds had arrived by that time, a couple of team matches were shot.

On Friday morning the party left at 8:05 from the Union station on the Central Kentucky Division of the L. & N. Railroad, and after a ride of about three-quarters of an hour, through the beautiful Licking River valley, arrived at their destination, which is fourteen miles from Cincinnati, where they were met by wagons which conveyed them and their paraphernalia to the grounds.

The grounds where the shoot was held are situated on the banks of a large artificial lake, the high, sloping banks of which are fringed with a fine growth of oak and walnut trees. There is a commodious club house, a bath house, a number of boats, and the lake is well stocked with fish. In the distance are the beautiful Kentucky hills, the whole making a picture which is a delight to the eyes of the tired city man. With all these adjuncts to pleasure added to the pure air and magnificent scenery, a day spent here forms an oasis in the life of the busy worker which will be long remembered.

The grounds are under the control of a few Cincinnati gentlemen and were tendered to the trapshooters through the courtesy of Col. West.

The birds were mostly fast flyers, and among them were some screamers. There were a few sitters, but in most cases these turned out to be hard ones when they did start, going off with a twisting flight which puzzled the men behind the guns, and which were represented on the score sheets by a 0 or a *.

The wind was blowing hard toward the traps, and aided the birds very much, so that in a number of cases, those which were hard hit by both barrels were carried over the boundary before falling dead. The traps used, three in number, were of the old scoop pattern, and worked well.

A dinner of fried chicken, with all the accessories, was prepared by chef McComas, and served in the club house. The shooters needed no urging to respond to the dinner call, and here straight scores were made.

A number of hard luck stories could be told by most of the participants. In event 3, Pohlar drew three outgoing right-quarterers; they were screamers, and carried the shot over the boundary before falling dead. H. Norris drew a fast left-quarterer for his first bird in No. 2; it was hard hit, but kept going until it crossed the boundary. In No. 3 a straight score was spouted by his fourth bird, which darted off to the right and fell dead out. Pohlar made a fine second-barrel kill of his ninth bird in event 3; it was a left-quarterer, and was almost out of bounds when he dropped it. H. Norris is a shooter who will bear watching. If we are rightly informed, this was his first live-bird shoot, and he made some of the finest second-barrel kills of the day. Kohler lost his fourth bird in event 3 by not having his gun cocked, an oversight which happens occasionally to many shooters.

In the afternoon the sun shone in the shooters' faces, and bothered quite a little. The wind did not blow quite so hard as in the morning.

Gambell's two setters, Colonel and Pen, kept up the reputation they have earned as retrievers. The former is, beyond question, the best retriever of pigeons in the country. When he goes for a bird, he brings it back. He seems to know when a wounded bird is within the boundary, and exercises almost human intelligence in his efforts to secure it without driving it out. One of the birds to-day fell into the lake, and Colonel went in after it. As the dog drew near, the pigeon rose from the water and flew to the opposite bank. The dog followed, retrieved it and swam back with it in his mouth. This feat was observed by many of the shooters, and was commented on as a most unusual occurrence. Pen is a good and careful retriever, but is hardly in the same class with his mate. Both dogs seem to enjoy the sport even more than the shooters.

The shooting was refereed by Mr. John Falk. The scores follow, the team shoots taking place on Thursday:

Cincinnati, O. BONASA.

Davies County Gun Club.

THE fall tournament of the club, held at Owensboro, Ky., on Oct. 6 and 7, was a pleasant affair, but the attendance, and the sport also, were lessened by the rain on the last day. Some of the best-known shots in the country were present, among them being R. O. Heikes, Fred Gilbert, Hood Waters and C. O. Le Compte.

On the first day, which was at targets, there were fifteen entries, high average being made by Fred Gilbert, who broke 201 out of 210. R. O. Heikes, of Dayton, O., was a good second, with 197. G. Herr, of Owensboro, was high gun of the amateurs, making 191. Hood Waters and C. O. Le Compte were not in their usual form, scoring but 178 each. Other shooters arrived in the evening, to take part in the live-bird events of the second day. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot at.	Broke.
F. Gilbert	10	15	20	25	9	15	19	24	10	12	19	23	210	201
R. O. Heikes	9	15	19	24	9	13	19	22	10	14	19	23	210	197
G. T. Herr	7	15	17	25	10	14	19	23	9	14	17	21	210	191
Wm. Dawson	7	12	18	21	8	14	19	21	10	14	17	20	210	181
Hood Waters	7	11	20	22	10	15	16	22	10	13	13	19	210	178
C. O. Le Compte	10	12	20	22	9	15	16	19	5	14	14	22	210	178
J. T. Griffith	8	12	18	23	9	15	20	18	6	13	15	19	210	171
J. Lewis	8	11	18	22	9	13	15	18	7	10	17	17	210	166
R. A. Powell	7	10	15	23	8	9	14	18	5	13	15	19	210	156
A. Newman	10	13	17	21	9	12	17	20	7	13	15	19	150	124
B. G. Robinson	9	15	19	24	9	13	19	22	10	14	19	23	115	95
T. Collins	8	12	18	23	9	15	20	18	6	13	15	19	70	58
J. Aldridge	9	11	16	20	8	12	15	18	7	10	17	17	70	57
J. C. Burch	9	11	16	20	8	12	15	18	7	10	17	17	70	56
J. C. Shallcross	9	11	16	20	8	12	15	18	7	10	17	17	45	38

On the second day a severe wind and rain storm kept many shooters and spectators away, but nine sportsmen competing in the events. Some remarkably good scores were made in spite of the hard weather conditions. The last event on the programme, a miss-and-out, was the most exciting race ever shot on these grounds. Waters dropped his 15th bird, and the race was between Fred Gilbert and James Lewis, captain of the club, the former winning by a score of 23 to 22. For an amateur to hold his own in this way against an expert like Gilbert is surely something for him to be proud of.

Gilbert was high man with 63 kills out of 64 shot at. Lewis second with 59 out of 62. Heikes third with 53 out of 59. But for the bad weather to-day this would unquestionably have been the most successful tournament ever held on the local grounds. The scores follow:

Events:	1	2	3	4	5	6	Shot at.	Broke.
Targets:	5	7	10	10	*	*	49	42
Waters	3	6	10	8	1	14	64	63
Gilbert	5	6	10	9	2	3	59	53
Heikes	4	7	9	8	7	7	22	17
Le Compte	2	7	8	9	9	4	47	40
Herr	4	5	9	8	9	4	62	59
Lewis	5	7	10	9	7	22	5	2
Dr. Griffith	2	2	2	2	2	2	22	17
Wm. Dawson	4	6	7	7	7	7	12	6
J. T. Griffith	3	3	3	3	3	3		

*Miss-and-out.
BONASA.

Tournament at Columbus Grove, Ohio.

THE Columbus Grove Gun Club held a tournament on Oct. 6 which proved to be a very enjoyable affair, although not as well attended as had been expected. The trade was represented by C. W. Phellis (Phil), R. Trimble, M. Hensler. High average was won by Phil, with 186 out of 200; second, R. Trimble, 183; third, Hensler, 177. High amateur average went to the seventeen-year-old boy, Grant Bogart, who broke 176. The scores:

Shot at.	Broke.	Shot at.	Broke.
Phil	200	186	145
Trimble	200	183	116
Hensler	200	187	130
Bogart	200	176	105
Barnett	200	172	78
Johnson	170	151	85
George	155	128	70

D. HOSMER.

Whitney-Milner Tournament.

DES MOINES, Ia., Oct. 7.—Whitney and Milner's two-day target tournament closed to-day. The attendance was fair. The shoot was a success. The weather was fine on Tuesday, but, on Wednesday, a forty-mile wind blew across the traps, and made the shooting very difficult.

Harry Taylor, of Mecklin, S. D., was high on the first day with 188. F. B. Cunningham, of St. Joe, Mo., was high on the second day with 177, and won high amateur average for the two days. Heer and Crosby tied for high average with 361 out of the 400. A number of the shooters will leave for St. Joe to-night to attend the Missouri State Amateur Tournament.

Oct. 6, First Day.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

SOME ENGLISH WAYS.

It is not yet three centuries since the practice of shooting birds on the wing was first taken up, the birds being found by a setting dog as in earlier days, when the same dog found the birds for the netter. The flintlock gun was invented in Spain about 1630, and the detonating tube, followed by the copper cap, came in the early days of the last century, about 1818. In 1836 was invented the LeFauchaux cartridge, to be used in the breechloader, and this gun, variously modified and improved, is in use to-day.

For nearly 250 years the shotgun shooter traveled the fields, following his dogs, content to kill his birds as they got up before him, and in America that is the practice to-day. But things are very different in England. There, as we are told by gun makers, and as we may read in books and periodicals, this form of shooting has become too slow. The gunner now cares chiefly to let off as many cartridges as he can in a given time. Hence has arisen a practice of having battues of pheasants, the birds being driven from their coverts by a long line of beaters, in such a way that they will fly over the line of shooters. In the same way the grouse moors are driven, the birds being herded toward the line of shooters who lie concealed in pits or stone towers along the crest of some hill over which the game is expected to fly. All this we have heard of with more or less frequency of late years, and to the American gunner it all seems more or less strange, but within a few years the practice of driving has been extended to partridges, which are frightened from their homes among the roots or in the stubble and driven toward or over the line of gunners, or a line of shooters march forward, putting up the birds before them, and shooting at them as they fly. The use of dogs—except retrievers—is being given up.

In England many people now speak with some contempt of men who are content to potter about, following the dogs, with the prospect of getting a few shots. The average English shooter is not content with this. He must have his place in line with two or three guns, which he stands ready to fire as quickly as possible, and then to pass back to his loader, who stands behind him, taking the empty gun, loading it, and instantly passing it back to the shooter.

This is the refinement of game preserving—of raising birds merely for the purpose of killing them—and is not likely to have a place in the system of American sport for a long time. For at the present day no conditions of American life favor it.

That pheasants are reared artificially in England is an old story to all. The bird is an exotic, living in a climate and under conditions quite unlike those of its native land. What is not so well known is that grouse and partridges as well are reared more or less by hand, or, if not quite this, nature is assisted to a point where really not much is left for her to do. The rearing of grouse by hand has only been undertaken lately, but the artificial production of partridges is quite an old story.

All land which is not grown up with forest or underbrush is, or may become, suitable for partridges, and the desirability of having large numbers of birds to shoot makes it seem to British proprietors a matter of great importance to hatch artificially all the eggs that can be had. In Britain, however, such eggs are private property which may be stolen by poachers, and therefore cannot be purchased there without the danger of buying stolen goods. This difficulty is overcome by importing the eggs of Hungarian partridges. These eggs are placed under small hens, preferably bantams, and hatched usually in from twenty-one to twenty-four days. The question of feeding is one which has called for great care, thought, and experiment, but now seems to be pretty well understood. At the age of about six weeks the broods with their mothers are removed in their coops to the fields, and the

coops opened after dark, so that in the morning the birds have a chance to avail themselves of their freedom. When about two months old, the partridges gather into coverts and thereafter are wild.

On some estates imported Hungarian birds are kept in captivity in large pens from which small pens open. After the birds have paired, they seek the seclusion of the small pen and nest and hatch there in captivity.

It is interesting to see the strides which the artificial rearing of birds has made in England, and this success should offer encouragement to the few men in this country who are endeavoring to domesticate the ruffed grouse and Bob White. Patience, room for experiment, and abundant time are certain ultimately to result in the artificial rearing of game birds on this side of the water as well as it has been done in England.

THE SIDE HUNT DEVASTATION.

An exchange of recent date recounts that some shooters have made arrangements to hold in western Massachusetts one of the old-fashioned slaughtering contests, euphemistically called a club hunt, or a side hunt. It is a kind of game hunt, or, rather, animal slaughter, which involves a clean sweep of undomesticated life in woods and fields in so far as the participants can compass it. The greatest quantity possible of every kind is the desideratum.

The sentiment of the public, and especially of the large class of the public composed of sportsmen, has always been emphatically opposed to side hunts because of their unscrupulous purposes of wholesale slaughter, violating all the accepted principles of sportsmanship and the rights of others. In latter years the side hunt has fallen into the disuse and obloquy which it deserves.

Some years ago, in certain sections of the United States, side hunts were of frequent occurrence. They had a certain vogue with clubs whose members had strong competitive and destructive instincts. A dinner to the winners was the penalty incurred by the losing side, thus there was an incentive to kill for the sake of the dinner on the one hand, as well as for the pleasure of personal and team victory on the other hand.

By way of illustrating the sweeping destructiveness of animal life consequent to the side hunt, the following list of animals and their values is presented. It is taken from FOREST AND STREAM, and is dated October 15, 1886, at Gardner, Mass.: "White rabbits, 100 points; coverts, 50 points; gray squirrels, 100 points; red squirrels, 50 points; chipping squirrels, 25 points; crows, 100 points; partridges, 100 points; blue jays, 50 points; red-headed woodpeckers, 50 points; partridge woodpeckers, 50 points; blackbirds, 25 points; robins, 20 points; skunks, 10 points." There were fourteen men on a side, and they scored a total of 14,315 points. In FOREST AND STREAM of November 4, 1886, is an account of a side hunt which took place at Lowell, Mass., for a dinner. One side scored 30,250 points, the other 16,685 points. Thus the aggregate of wanton destruction must have been great. It will be noted that the list includes almost every undomesticated animal which was present in that section at that season. In the list all consideration of availability as food is abandoned. All considerations, too, of sportsmanship are utterly ignored. The purpose was to kill all that could be killed, and kill more than the opposition. The bird or beast scored regardless of the manner in which it was brought to bag. Game birds, song birds, and vermin were alike sought because their bodies had a numerical artificial value for mere purposes of addition. The old plea in justification, while it had a certain speciousness on its face, failed utterly in justification on the slightest analysis.

It was said that a side hunt, fifty or a hundred killers participating, was only the equivalent of the same number of men shooting separately on different days, and that the total of the side hunt appears inordinately great merely because it is a total. Also, it was held that it was quite as legitimate to shoot animals in a competitive way as it was to shoot pigeons at the trap in a competitive way, the principle being the same, it was contended, in either instance.

Either plea abounds with fallacy. A man, shooting alone, would not systematically kill every living, unprotected creature which he could bring within range. There is not the incentive to kill everything when a

man is shooting alone, each animal then having its own natural value, that there is when each animal has an artificial valuation, as fixed by the side hunts. Few men shooting alone, are wanton destroyers of life. No greater exemplar of a bloodthirsty destroyer could be imagined than that of a man shooting alone after the manner of slaughter in a side hunt. Nor is there any analogy between the side hunt and shooting at the traps. The trapped pigeon is the personal property of the shooter, and after being killed is serviceable for food. The wild game birds and animals belong to the people of the State, and at best the ownership of possession is qualified. To devastate or to partially devastate a large section of the people's property, is a moral wrong even if the letter of the law may not have foreseen the possibility of the destruction and guarded against it. The trend of all modern legislation is to restrict what the individual may take to limits of moderation; and it would be absurd to assume that the people would restrict the individual, and ignore a mass of individuals killing as a horde.

Team hunts seem to have had their origin in a beneficial custom which obtained in pioneer days, when the power of a county sallied forth to kill the bears, wolves, wild cats, etc., which were a menace to the whole community. The choosing of sides and the competition thereby engendered, stimulated each man to kill as much as he could of the common enemy. The side hunt, in a game killing contest, is a perversion of this once beneficent custom. The sportsmen of every community should discountenance uncompromisingly the side hunt whenever such perversion of sport and sportsmanship is attempted.

THE BERTILLON SYSTEM IN MAINE.

The Bertillon system of anthropometric measurements for identification of criminals is now in almost universal use by police authorities throughout the civilized world. When a criminal is arrested and taken to headquarters, he is measured in much detail as to height, length and width of head, length of ear, of forearm, of middle finger, of little finger, and of foot; and all these details, together with others of sex, age, color of hair and eyes, beard and complexion, and contours of profile—forehead, nose, lips, chin and ear—are carefully recorded. In addition a careful record is made of any particular marks, such as pigmentary moles, scars or cuts, boils or wounds and tattooing. All these supply infallible data for subsequent identification, if at any time the same subject is rounded up by the police.

The Maine authorities have adopted the Bertillon system of identification of criminals for the identification of non-resident sportsmen who visit that State for hunting. That is to say, they have adopted the Bertillon system in part. That they have not adopted it wholly is due probably to a feeling that a non-resident sportsman is not wholly and altogether a criminal, whose complete anthropometric record should be on file for the good of society.

The non-resident sportsman who desires a Maine hunting license must first procure a prepared blank, which must "state the name, age, residence, business, post-office address, color of hair and eyes, and height of the applicant, and whether he can or cannot write his own name." The lengths of nose, of head, ear, and other parts of the body, together with any particular marks such as a mole six centimeters to the left of the vertebral column and fifteen centimeters below the seventh vertebra, will doubtless all come in good time, as the exigencies of the system shall require. This will be more or less inconvenient for the applicant, but the Augusta authorities may be trusted to make it as easy as they can for the non-resident who wants to get into Maine; and to this end, it is reasonable to assume, they will arrange with the police authorities of the large cities to do the Bertillon measuring, in consideration of a small fee (to be paid by the applicant). Then when a sportsman living, let us say in Boston, shall hear the Red Gods calling, he will straightway repair to police headquarters, divest himself of his clothing and have his physical dimensions ascertained and recorded, and his moles and other marks mapped and duly set down. Arrived in Augusta he will present himself at the Bertillon anthropometric identification bureau, run in connection with the Fish and Game

Commission, and there undergo a test of mensuration to determine his identity. If the details that have been recorded in Boston shall agree with the ones ascertained in Augusta the commissioner may, if he is favorably impressed with the subject, issue a license on the payment of the license fee and the Bertillon identification bureau fee.

When he shall once be in the woods with his registered guide and his license, the crimi—we mean sportsman—will have nothing to mar his perfect enjoyment of the delightful freedom of the wilderness, except that once or twice or thrice in a day he will be called upon to disrobe and submit to such application of the anthropometrical instruments as the canny game warden may consider absolutely essential to the making sure that he is the individual who measures up to the figures set down in his certificate, and that his moles are all where they ought to be.

There are men who, having gone down to Maine for many years without restrictions, resent the present non-resident exactions, and profess to feel a certain sense of indignity put upon them in the requirement that they shall give their identification points of age, height, color of hair and eyes and other details, for all the world as if they were up for pocket-picking or sneak-thieving. If such finicky persons really and truly want a Maine deer, they would do well to swallow their scruples and get their game to-day, before shall come the morrow of ear measurements and strawberry marks.

The Sportsman Tourist.

With the Golden Plover.

ROBERT E. MERRILL, of the Iowa State University, writes me that he was much interested in the story of a golden plover shoot I enjoyed a number of years ago down at McPaul, Ia., and which he read in the FOREST AND STREAM. Mr. Merrill is an ornithological student, and he writes me for information about the golden plover as I knew the bird some sixteen or seventeen years ago, its habits, and the causes of its disappearance roundabout here. In response I will briefly say that there have been more golden plover killed in this vicinity this fall than for the past dozen years, and some of our sportsmen predict that this precious little bird is about to return to this section, but there is no chance in the world for that. Out below Waterloo last Sunday, while jack shooting, Clarence Sobotker and Charlie Wilkins knocked five out of a passing flock of thirty or forty birds, and the same day Herbert Leavitt and a friend bagged fourteen on Mr. Leavitt's ranch near Valley. The latter gentlemen were also after jacksnipe, and the golden plover came in by accident only. Mr. Leavitt told me yesterday that they saw at least a dozen large flocks on the occasion referred to, and that if they had paid as much attention to them as they did to the jacks that they could have made a big kill. And for additional proof that these birds have been encountered here with unwonted frequency this autumn, I only have to mention that the day after receiving Mr. Merrill's letter of inquiry, W. B. Kirkuff, of Council Bluffs, walked into my office and depositing a paper sack on my table, said: "Here, Sandy, is a bird, and we want to know what it is. I say it is a golden plover, but Dr. West—and he's posted, you know—says it is not."

I opened the sack and found a full grown young male golden plover, alive and as sprightly as if just off its customary feeding grounds. Nearly a week before the bird had been shot out of a flock of fifty or sixty, which George Hathaway had run across on the flats below the elevator on the other side of the river. He knocked three or four out of the passing bunch, wing-tipping the bird in question. Dr. West, who is certainly well versed in the lore of the field and stream, was most likely misled as to the identity of the bird by the fact that it was in its first autumnal dress, and the markings were less distinct than they would have been a month later. This bird—the one Mr. Kirkuff brought me—I took over to Albert McVittie's sportsman's resort on Harney street, and for several days it attracted much attention in his show-window, but latterly it refused to eat, grew mopey, and I took it down to taxidermist Wallace for mounting. As Messrs. Kirkuff and Hathaway are both readers of the FOREST AND STREAM, I will again extend to them my thanks here. The specimen is a beautiful one, and I value it highly. It brings back the days of old.

The golden plover used to spend two or three weeks in this section of the country, both spring and fall, in great numbers, and the shooting down about McPaul and Bartlett and up round Herman and Bancroft was always great. They came here more plentifully in the fall season than any other, and remained here longer and afforded better sport for the gunner. In late April, in a normal spring season, they would come here in great flocks, remain but a few days, then continue on to their northern breeding grounds, but few of them lingering this side of the 46th parallel for the purposes of nidification.

The bird was always a most interesting little fellow to me, and I used to put in much time watching them. They dart around over the ground with astonishing agility, reminding one in their peculiar movements of young domestic chickens. When they first espy an approaching gunner they will run with considerable speed for quite a distance, suddenly stop as short as if they had butted into a stone wall, nod their heads comically and tilt their graceful bodies several times, vibrating peculiarly from side to side at the same time, and then they will away again. If they think they have not been discovered they will sometimes lie down and lie crouched close in the short grass until you almost kick them up. When getting ready to leave the country or locality, like the upland

plover when he alights, they will lift their wings in the air over their bodies several times, a brief moment each time, and this the experienced always knew behooved prompt action on his part. When feeding on good grounds they will move along with the regularity of a column of soldiers, jerking their bulb-like heads from side to side, and picking at this and that tempting morsel with a singular bending motion of their gold mottled bodies. They are always weird acting little fellows, and at times will dance and jump and stamp around in a limited area on our moist pasture fields for hours at a time to force the angleworms out of their tiny holes in the soft soil. In September and October they are particularly fond of our winter wheat fields, but are frequently met with on our sunny hillsides, where the wild rose berry and the grasshopper flourish. Again, like their congeners, the uplands, they are gluttons for grasshoppers and coleopterous insects of various kinds. When on a long pilgrimage in migrating time they fly in a line and with much speed, the leaders almost constantly sounding that sweet and musical note that belongs to no other little throat. When they come down here in the fall, and before coming on to a field to alight, as if in an abandon of gladness that their journey is at an end, they will go through many funny evolutions and aerial reticulations, now swooping down and skimming low over the ground, then straight up into the air again and round and round, sometimes gliding through space sidewise, with one sloe-black eye on earth the other on sky, flying out and in and backward and forward in a manner that often tires and disgusts the waiting and impatient gunner. John Hardin, A. H. Penrose and Billy Townsend and myself killed 180 plover in one day's shooting down near McPaul, Ia., in 1888, and even then did not consider that we had accomplished any great shakes.

But to revert to the habits of the bird. When they do light, when arriving here in the fall, the moment their dark feet touch the ground is the critical moment to the shooter, as they are solidly congregated and closely bunched up, but remain so but a transitory moment. The very second almost that their toes touch grass or ground, they separate, like a dash of oil on a still pool, and run widely apart. They also remind one very much of the curls in their flight, checking themselves every whip-stitch in their seemingly maddened rush, as if to examine some object on the ground below, and all the time giving free vent to that singularly mellifluous cry, *Cour-lee-ouee!* *Cour-lee-ouee-ouee!* When they get in here in September—that is, when they used to come—the young birds made capital shooting. They would swoop down and alight on a field, dispersing quickly and running about apparently without aim, but with the most amusing alacrity, and with the one object of filling their crops—filling their bobbing heads. Often, when first in, they would be very tame, as dumb-acting as young blue-wing teal, and a shooter could get right on top of them before, with that inevitable *curl-lee-ouee!* they would jump up into the air and scurry away. That day, down at McPaul, Hardin and I would walk round and round a flock of adolescent birds, gradually crowding them in closer and closer, until finally we would have them, wild-eyed and long-necked, formed into a small circular knot, and then—well, we don't do those things nowadays.

But the golden plover is but a dream of the past, notwithstanding the unusual numbers seen this fall, and in a few years more will be as good as extinct. I forgot to mention that at times I have seen them wading about on our overflowed meadows, but, like the upland plover, they prefer dry ground, differing in this respect from the jacksnipe, yellowleg and killdeer. I have also known them to probe our mellow loam just as the gallinages probe it, but in the fall the dry cow-dung on our grazing fields is what they revel in. Here they will roll and scratch and pick just like barnyard fowl for hours and hours at a time. They are seldom found in poor condition, and are one of the choicest table birds known in this part of the world, and I do not believe that a pair of them to-day at Rector's, Sherry's or Shanley's would allow you much change out of a \$5 William.

To-morrow afternoon, together with my boy Gerard, Major R. Barber, of Baltimore, and Charles Miller, of Kansas City, I leave for the Cherry county sandhills for two weeks with the grouse and the wildfowl. Judge Ives' party, which consists of himself, Dr. Connors, M. A. Hall, Edward Jacobs, Frank Carpenter, E. Abrahams, John A. Kuhn, and Frank Campbell, leave this afternoon for the Crane marshes below Ainsworth, and on Thursday Charlie Metz, Dr. Downs, Billy Marsh, Pete Burk, Mike Fitzgibbons, Dick Seamon, and Charlie Lewis go to Lake Creek, up on the Pine Ridge reservation in South Dakota. John and Sandy McDonald, Jim Tuthill, Gus Harte, Al. Powers, John Hoyer, and Fred Anderson also leave on the 15th for Marsh and Coyote Lake, west of Woodlake, while Charlie Suffin, C. A. Bishop, Fred Rose, and W. D. Smith depart for the canvasback grounds out in Deuel county.

SANDY GRISWOLD.

The Cabin Plan.

Editor Forest and Stream:

For the benefit of my fellow nature lovers, who are readers of your paper, and who, like myself, are not overburdened with this world's goods, I will here describe the arrangement that I have for an outing during my summer vacation, and for the past nine years I have spent from four to six weeks each year in that way.

Having a tract of woodland in northeastern Connecticut, in 1894 I built a rough cabin upon it—the photograph of the cabin was reproduced in FOREST AND STREAM some six years ago; also, dimensions and cost of material were given; but as many who never saw that paper might be interested in some such a project, I will again describe and give the cost of the little hut, as many might be pleased to call it.

Its dimensions are 16 feet by 20, with 9½ feet posts; frame of chestnut timber and plenty of it; covered with unplanned inch white pine boards, and battened outside with 4-inch cedar poles, halved; floor of 1-inch chestnut boards; roof of best cedar shingles, and having a well-built brick chimney, which has been put up since

photo for FOREST AND STREAM was taken; piazza 6 feet wide in front. The chestnut and the pine were cut on the premises.

Had I bought all of the material it would have cost some \$250, but, perhaps, one like it might cost \$300 at the present time, as builder's supplies and labor are dearer now.

It is so well and strongly built that a cyclone might tumble it over and over, but never could tear it in pieces, and not a drop of rain gets inside.

During each of the past four years some one of my children has gone there and roughed it with me, and each considers having an outing at the hut the event of his or her life; also several friends of ours from Asbury Park have had outings there before this year. This year my eldest daughter was there for six weeks with me, in June and July. When the season at the shore was nearly over my other daughter with two young lady friends of hers, were up there and put in three weeks, and after they came back my boy, with two other youths, went up for three weeks, and all of them seemed to consider it the height of enjoyment. Not only all of them, but several others from Asbury Park, are already making arrangements to have outings there another summer, and as far as healths are concerned, I never saw a healthier lot than they all were when they came back.

Now, what I am driving at—mind, I have no ax to grind—is this: that a great many persons, and families, too, in very moderate circumstances, could have some such an arrangement for an outing during the whole or part of the summer at a very little cost. Just think of it, no rent to pay, no fuel to buy, taxes nominal, plenty of milk, eggs and vegetables to be had at first cost, several kinds of wild berries and lots of them to be had for the picking, plenty of the purest air and drinking water, and such sleeps and appetites! yes, and healths, too! and besides no doctor's nor druggist's bills to foot!

Grub for self alone costs less than \$1.50 per week, with others at the same rate, and we have more than plenty. No condiments to spur up one's appetite. Don't require any.

Now, one could get a tract of several acres of rough land, or, perhaps, the whole, or a part of an abandoned farm, in some satisfactory locality—say, near some lake or stream—for less than one would have to pay for a small lot in or near a city, or large village, and improvements—cabin, also furniture—would cost but a little comparatively (by the way, I made all of the furniture for the cabin, stove excepted, out of rough boards, and of different woods cut on the tract), and thus one of small means could enjoy nature and country life in as great a degree as many wealthy ones do.

The tract would also be a good game preserve or shooting ground, for its owner in open season.

Why, I wouldn't exchange my annual outing time with rough bed and fare at the little Bresh hut on Oakledge tract, with its brooks and near-by trout streams, forest and big shade trees, and lots of other advantages, for twice that length of time spent at the best summer hotel in Long Branch, Elberon or Asbury Park, with the fashionable botherations, the highly seasoned and fixed-up feed (with consequent medicines), and the airy (or stuffy?) rooms, with auto and coach service thrown in besides.

A. L. L.

North Carolina Incidents and Game.

RALEIGH, N. C., Oct. 17.—Dr. J. W. McNeill and his son Pembroke, are both among the most ardent sportsmen of the Cape Fear section. Their home is on Rockfish Creek, near Fayetteville. A few days ago they went to a place on that stream to catch the yellow perch which so abound there, and which are so highly prized as a game fish and as one of the finest for the table. With Dr. McNeill and Pembroke was one of his hounds, a thoroughbred. She sat near them, looking into the water as they began to fish, but suddenly lifted her head, looked up into her master's face, and then swiftly glided off through the undergrowth. In a few moments she gave tongue a quarter of a mile away, plainly on the track of a fox. Her chase could be clearly followed until she reached what is known as "Carver's old field." Suddenly the music of the dog was shut off; so quickly that at first it impressed Pembroke, but the fishing became very lively and the matter passed out of his mind, and he went home. The hound did not show up at dinner, nor that night, and Dr. McNeill began to be alarmed. Three days passed, but no dog appeared. Search was made all over the neighborhood. On the fourth morning Pembroke remembered that the music of the dog had stopped about the Carver old field, and started off with a companion to make an investigation there. In a dry well, 25 feet deep, they found both dog and fox, alive and lively. The dog was on guard while the fox was intrenched in a little recess in the side of the well. Whenever the fox ventured out the dog made a dash for it. It was very plain when Pembroke looked down in the well that both the dog and fox had been stunned when they struck its bottom, and that the fox, recovering first, had scratched for himself the narrow hole in the clay wall of the well before the dog came to her senses. The hound was pulled out with a noose, the fox leaping up and biting and yelping in a frenzy or rage as the dog was lifted up. Then the fox was caught in a bag, taken out of the well and given its liberty. It dashed away as if it had not missed a meal.

In the Cape Fear section there is glorious fox hunting, and there are some notably good packs of hounds. The cover is good and the record made by some of the old sportsmen is remarkable. The oldest of all the sportsmen was ex-Senator Carver, over 75 years of age, tall and spare, but very active. Not long ago he offered one of his finest hounds to any member of a party of his guests who would make the nearest guess as to the number of foxes he had captured. One man guessed 1,200, and another 1,260. The latter won the dog, Carver saying that he had captured 1,264 foxes in his life. He had "kept tab" on his captures. In this State foxes are run with large hounds, the hunters being on horseback, though persons very familiar with

One Day and Another.

MEMORY is clear and distinct regarding the general outlines of one day in my life, but hazy in some of the details. I can see a small barefoot boy, trousers carelessly rolled half way to the knees, a straw hat, such as country boys wear, much the worse for wear, for being used at sundry times as a net in which to catch minnows, a trap to clap down over fledgling birds or bright butterflies, a handy and useful vehicle in which to carry cherries, apples, straw or blackberries—no one but a country boy knows what a terribly useful article a straw hat really is. This particular day I had my own and my very first fishing line. I earned the money to buy it driving a flock of sheep (I guess I only helped one of the farm hands drive them to Grandfather's). Father had cut me a beautiful pole, none of your new fangled split-made things from a factory—and I am by the creek ("crick," we called it), which lazily lolled along in the edge of the meadow. The new and bright cork is dancing on the gentle ripple of the water. I know my bait is right; did I not put on a big worm and spit on him before dropping the hook overboard? Pretty soon the cork gives a little wiggle, and my heart almost stands still; surely that time it bobbed. I am growing impatient, but remember my father's instructions, "Wait until it goes way under." Two or three times in quick succession it tilts, and I am sure that I was sweating—perspiration is too mild a word. Suddenly, in a slanting direction, that blessed cork starts up stream and for the bottom. It really seems as though it would be out of sight before I can bring my rigid muscles into action; but I "jerk," jerk hard enough to have broken the best of tackle with a really good fish. Well, I have him on the bank—I don't know which—a small catfish, or perhaps a sunfish, perch or chub, I don't remember what the variety was—I had caught him.

Another day—

My boys are in college, my girls in the high school. I have left my business and have traveled six hundred miles for a week's shooting over my own dog. Not that he is the only dog I have ever owned. I cannot remember the time when I have not owned one or more of one breed or another, but this one from the moment I first saw him appealed to me, why I do not know. He was the homeliest pup I ever saw; his eyes were too light, his head too flat, his ears too thick, nose too sharp, and, sin of all sins in a hunting dog, he had a slight crook at the tip of his tail. As a pup he seemed to think himself just as smart and as good as the children. When I began to hunt him, he could and did find game; the difficulty was to find him. Then he began to point beautifully, and would hold his point until I got within from seventy-five to fifty yards; then, apparently thinking that he had been extremely patient waiting so long for me, with a bound that seemed to say, "There they are, come on," in he'd go, and I would see visions of frightened birds and flying dog. If, through some accident, I succeeded in getting near enough to make a kill, and the dog happened to point long enough to see the bird fall, he would go for it—and findings were keepings with him. Why not? I always kept the bird when I got it first, why not he? He would swallow the bird with an air of having done something really worth while, and a look that seemed to say, "I got that one, old man."

He had great speed, a wonderful nose, endurance beyond belief, was bold as a warrior, and had game sense that was unerring. He was good natured, and the happiest dog that I ever saw. His attachment to me amounted to devotion, yet he seemed worthless. I asked John Lewis one day what he thought could be done with him. "Didn't know, but would take him and see."

I had traveled six hundred miles for a week's shooting, and men who really work will appreciate my feelings as I started out that right frosty morning in North Carolina with Sandy Gladstone, I. Murray Mitchell's favorite and celebrated dog, for Donald's companion.

Sandy Gladstone needs no words of praise to anyone who ever saw him in the field, or on the bench, for that matter. It was a hard place to put out my dog. I can only wish that others had been there beside Lewis and myself. Never a falter by either dog; each one speedy, self-reliant, hunting out his own ground, no mistakes, no jealousy, never a refusal to back or a break at shot or wing, my dog a splendid retriever. We came miles and found quantities of birds; the country suited this stout-hearted and strong-limbed pair, and my dog held his own with one of the best dogs that ever pointed a bird. Sandy is still living, resting on his well earned laurels, with every comfort that a dog can have. Donald sleeps beneath a magnificent holly tree on Duncannon plantation in South Carolina.

GEORGE BATTEN.

A Lost "Woodcraft."

ONE of the phenomena of everyday life is the manner in which some inanimate objects travel in circles, and, after many years, return to their original owners. Eighteen years ago a party of Philadelphia boys, returning from a camping trip in the Pocono Mountains, stood upon the Pennsylvania Railroad platform at Trenton, waiting for a train to this city. When the train appeared one of the party missed a small cloth-bound book, bearing the title "Woodcraft." It had evidently been stolen from his coat pocket while he was waiting on the platform. The loss of the book has been mourned ever since, for it reflected much of the boy's love for mountains, woods, and trout streams. Years passed, and, finally, in a mood of longing for boyhood zest for outdoor life, a bright new copy of the book was purchased, but it seemed to lack the flavor that made the old book a loved possession. Last Monday night two men were smoking in a library, when the host said: "Do you know this book?" He produced a little book, bound in blue cloth and stamped on the side in faded gold with "Forest and Stream Series—Woodcraft." The visitor seized the book, and exclaimed: "That is mine! Where did you get it?" "It is mine now," laughingly replied the host. "I bought it in a second-hand store. But here is your name on the inside of the cover." The story of the book's disappearance was told, and an exchange was effected. And so, after many years, the old book has returned to its original owner.—Philadelphia Record, Oct. 14, 1903.

Kipling's "Red Gods."

Editor Forest and Stream:

When I had read Manly Hardy's version of Kipling's poem, I consigned to the waste-basket an article which I had prepared on the same subject.

Mr. L. F. Brown has contributed so many good things to FOREST AND STREAM that I was truly sorry to have to object to his criticism of the poem.

Mr. Hardy has covered the ground fully, and his article, like all of his writings on the waters and woods of Maine, has the true ring.

In my boyhood days I could see from the knoll on which the little red schoolhouse stood, a shingle bar in Cortigan Brook. Years later that bar cost me time and money, for my hemlock logs would persist in forming a "raw, right-angled log-jam" on that bar.

Birch Stream is the dividing line between the towns of Alton and Argyle. For ten miles it winds through all kinds of soil, and its numerous bars are made up of shingle, sand and earth sediment.

I have dined on many of its bars, shingle and otherwise, while log driving and hunting. In a cold November day while setting traps on the quick water, I always found "sun-warmed shingle bars" protected from the wind by high shores a cozy place at dinner time.

My canoe was propelled by one of those "shod canoe-poles," only my setting pole was a double ender—shod at both ends. All the setting poles that I ever saw for canoes and bateaux were shod, and some were shod at both ends.

What Mr. Hardy writes about the "click" of the setting pole is true, and well known to every hunter and log-driver in Maine. Come East, Mr. Brown, come East, and grow up with the "right-angled log-jam and the shingle bar!"

HERMIT.

CHARLESTOWN, N. H., Oct. 16.—Editor Forest and Stream: Much as I have enjoyed some of the writings of your correspondent, Mr. L. F. Brown, I was simply disgusted when I read his criticism of Kipling's spirited poem of the "Red Gods!" I was tempted to answer it on the spot, but luckily did not feel like writing at the time, and so it fell to the lot of Manly Hardy to make the response, which he did so truly and thoroughly as to leave little or nothing more to be said. Mr. Hardy's sixty years of experience in the woods of Maine gives him the right and the knowledge to speak *ex-cathedra* on the subject, as he does, and I can only indorse every word he has said about log-jams, shingle bars, and canoe-poles. Now, in this week's FOREST AND STREAM comes another correspondent, criticising Mr. Hardy, to whom the best advice I can give is to read "Dogberry's" famous soliloquy and apply it!

Kipling probably wrote from his knowledge of New England streams and clearings, and his descriptions are true to the letter. There are acres, not to say miles, of "shingle-bars" in the Connecticut River at Brattleboro, where he married and lived for some years, and there is a large one on the same river opposite this village where I have basked in the sunshine many a time, and of which I have a capital photograph framed and hanging before my eyes, with two of my little granddaughters playing on it, while my daughter sits on a big stone near the bank, watching them.

The log-jams are very apt to form on these bars at the head of a rapid, and anyone looking up from below will see the "racing stream" as it pours through and under the logs which form the end of the picture, and are not only "raw" from having all their bark pounded off coming down over the rocks in the mountain streams, but "right-angled" and at every other possible angle, as they have been thrown up by the force of the water.

If anyone wants to see a good description of a log-jam, let them read Stewart White's admirable story of "The Blazed Trail."

Kipling has probably seen some of these very jams on the shingle-bars at Brattleboro, and if he lived there when Chesterfield Mountain, on the opposite side of the river, was cleared and burned over, a few years ago, as I think he did, he had the picture of the "blackened forest" right before his eyes.

As to shod canoe-poles, those used by the lumbermen are always shod, so far as I know. Those used by amateur tourists or summer anglers may probably be anything they can cut without too much trouble and throw away when done with. I have heard the "ring" of the shod poles on the rocks often, and no unshod one would "stand the racket" in our mountain streams. Your correspondents may write truthfully of the streams of Michigan and Wisconsin, but if they should visit the "Ammonoosuc" or the Pemigewasset, they would find both "racing streams" and sunny bars of shingle to their hearts' content.

Mr. C. H. Ames, also comes to the rescue in this week's FOREST AND STREAM, and again I indorse every part of his letter, particularly the defense of hemlock boughs, which are flatter and make a better bed than either balsam or spruce.

I might say much more, but the clock warns me to close to get this in the mail. I am not "stuck on" Kipling, but I claim to know something about woods life in New England.

VON W.

BUFFALO, N. Y., Oct. 17.—Editor Forest and Stream: I was amused by some of R. W. Ashcroft's criticisms of Kipling's poem and of his criticisms of Manly Hardy for defending Kipling from the senseless attack of Mr. L. F. Brown. I agree with Mr. Hardy that Kipling's poem is practically as true to nature as is possible in describing in verse. Mr. Ashcroft is very hypercritical in his arraignment of Mr. Hardy for some of his statements. For instance, Mr. Hardy says a bar is "anything which obstructs," from which Mr. Ashcroft deduces the conclusion that a mill dam is a bar, without allowing for the rest of the definition which Mr. Hardy omitted to add, but his sin was no greater than was Mr. Ashcroft's in his definition of a log-jam which he describes thus: "A log-jam is an aggregation of tree trunk sections," and I presume by the same reasoning a log-cabin would be a log-jam.

Mr. Ashcroft quotes Mr. Hardy as saying the canoe-poles may be heard "hundreds of yards." Now, I wonder

the routes the foxes are apt to take, sometimes join in the chase on foot. Cases are known in which foxes have been run 30 and 40 miles, the chase being in two counties. Renewed attention to fox hunting is now being given in several parts of the State. On the coast, near Beaufort, there is unusually good sport of this kind, among the small pines, scrub oaks and the tangle of yepoon and other small bushes, which are often so thick that horses cannot dash through, but have to follow the trails, while the dogs do the work in the thickets. It is not probable that in any State the fox hunting is better than it is in parts of North Carolina.

The partridge (no North Carolinian uses the word quail) shooting promises to be unusually good this season. In a few counties the season opened Oct. 15, but in nearly all it opens Nov. 1, and ends March 1 or 15. In a few counties it is only during December and January. The summer was remarkably favorable for the growth of the birds, and the broods are said to be unusually large. To give an idea of the number of the birds, it may be stated that a gentleman here at Raleigh, in the course of a Sunday afternoon ramble, recently found no less than nine coveys. In some cases there are double broods, the little birds, locally known as "squealers," doing their best to keep up with their older brothers and sisters. In this part of the State no lands are taken by sportsmen upon payment of taxes, but in the Piedmont section of the State many thousands of acres are so held, Guilford and surrounding counties being particularly notable for this sort of privilege. The game law for the State has been greatly strengthened by the Audubon law, enacted last March, which has stopped the killing of game out of season, since for the first time in this State it imposes a penalty for having game in possession out of season. It is stated that from one small station in the Piedmont section there were shipped out of the State last season 60,000 partridges, of which one man boasted that he sent away 40,000, he being the express agent at the place. It was an absolute violation of the law. Thousands of these partridges were sent away in egg crates with one layer of eggs on top to mask them, while others were sent away in trunks, valises and barrels. Great numbers of birds were illegally killed and sold during October of last year and previous years, but so far as heard from this year this has not been the case. There is no doubt that there is as good partridge shooting in North Carolina as the country affords. There is all sorts of cover, and the birds are found from the mountains to the very seashore. The acreage of field peas is constantly increasing, and this is found to be the very best food for these birds. In the eastern North Carolina pine country, where sportsmen from the North do not go much, is one of the very best sections for these birds.

A Personal Experience, with a Moral

If any one knowing my fondness for sport had asked me a year ago if I read FOREST AND STREAM, I should have unhesitatingly answered, Yes, certainly.

A quite natural conversation, something like the following, would have shown, however, that my ready and confident "yes" was not quite as truthful as I imagined. "I suppose, then, that you saw the article in last week's issue about the remarkable catch of black bass on the Delaware River, near Milford?"

"Well, no; I don't think that I saw last week's paper. I was very busy on Wednesday, went home late, forgot to get a copy at the newsstand and afterward it slipped my mind entirely."

"But the article in the previous week's issue, about the Garrisons, Ryersons and other old guides of Greenwood Lake; I daresay you were interested in that, as I know you used to fish there every summer regularly years ago."

"I certainly should have been very much interested if I had seen it, but somehow I must have missed that, too, though I intend to buy the paper every week, and don't think that I very often fail of doing so. Now that I think of it, though, there was a series of articles published not very long ago that I meant to put in my scrap book, but in looking over the papers, I found that one or two back numbers were missing, and that reminds me that I must try and get them before they are out of print."

Although this conversation is imaginery, I have no doubt that my actual experience, if recorded, would be not far from this, and not much unlike that of some others who, like myself, have always enjoyed reading FOREST AND STREAM, but have somehow neglected to buy it regularly each week from the newsstand.

But this spring a neighbor remarked one day that if I wanted to keep abreast of the times with rod and gun news, fish and game and forest preservation and other matters of interest to sportsmen and lovers of nature, the way to do it was to subscribe for FOREST AND STREAM, and so get the paper regularly each week.

I am happy to say that I at once responded, and many times since have been glad that I did so. The pleasure that I have since experienced reminds me often of what I must have occasionally missed; but never mind, I am sure now of having a good bill of fare set before me every week of things that I find served to my satisfaction and enjoyment, and as the old lady said, "That is very much to be thankful for."

A few evenings since while reading FOREST AND STREAM, I remarked to my better half, that I never before realized the high tone and character of the paper, and how much solid information its pages contain, aside from the pleasure its breezy and out-of-door articles recall and awaken.

Although not herself a fisher, "but a well wisher of the sport," she replied, "Why not write to the publishers and tell them that you think so. Perhaps, too, a statement of the satisfaction and enjoyment you have derived from your action, may lead some other casual reader to make it a point to subscribe at once to the paper, which you have in consequence learned to value more highly than before."

Hence the testimony of this subscriber, and the moral, "Go thou and do likewise."

R. W. WOODWARD.

ELIZABETH, N. J.

if he read Kipling's poem in the same careless manner; if so, possibly he might be excused for attempting to criticise the same. Mr. Hardy said: "It can usually be heard from fifty to one hundred yards." Quite a difference. Mr. Ashcroft also takes exception to hemlock boughs for bedding. Hemlock boughs are the proper thing, to my notion. In this description Mr. Ashcroft has Mr. Kipling done to a turn. In describing a tree trunk he says "anatomy of muscle beneath." Now, who ever heard of a tree trunk having muscle. Kipling would hardly dare so much. Mr. Ashcroft says "halderdash" at the idea of a sportsman sleeping "with the starlight on our faces." Easiest thing in the world. Cannot Mr. Ashcroft see any starlight from a shelter tent, for instance.

DIXMONT.

Editor Forest and Stream:

Mark Twain says that the difference between the right word and almost the right word is the difference between lightning and the lightning bug. It is astonishing that there are so many men who do not know the difference between Kipling's thunderbolts and bugs. It is their own loss, but it brings to the rest of us a tinge of sadness.

I have smelt wood smoke at twilight, and have heard the birch log burning, and am quick to read the voices of the night, and feel impelled to say that the words "raw" and "right-angled," applied to the description of a log-jam are so masterly in the stroke that if the Lord will let me find words like that for my own writings, critics may call me anything they please. No matter where Messrs. Brown and Ashcroft place their log-jams, mine occur at the end of a racing stream, or at a bend, or at any other point where the plunging logs are held up in their mad career in the foaming flood.

The click of a shod canoe-pole is so sharply characteristic of wilderness sounds that genius only could have guided the choice of that jewel for the literary setting. It is a peculiar sound, with strange, weird carrying quality, and may be heard further than the ordinary human voice above the roar of the torrent.

The bar of sun-warmed shingle is such a delightful place for basking and dreaming that many a man thrilled with the feeling that the Red Gods were calling him out when Kipling hurled his thoughts back from the work of the town.

The Indians whom I employ are silent and smoky. I have been trying to think of any other two words that would give so comprehensive and true a description, and cannot find a single one.

The couch of new pulled hemlock is particularly soft, fragrant and grateful, if carefully spread upon springy boughs of spruce, or, as my old guide, Caribou Charley, used to say, "on a bed boughed down with care."

Another writer, in the September number of New Thought, apparently does not recognize the difference between thunderbolts and bugs. She misses the awful significance of Kipling's "Vampire," and, applying his words to "wives" proceeds to write tragically in the misery of her misconception.

ROBERT T. MORRIS.

NEW YORK, OCT. 19.

BREWER, Me., Oct. 16.—*Editor Forest and Stream:* I inclose part of an article from the Boston Watchman. The writer is unknown to me. This shows that there are those who have seen "steel-shod poles" and been able to hear its "click." There are others who, "having eyes, see not, and having ears, hear not."

MANLY HARDY.

The Watchman writer says: "There is a fascination about canoeing which is associated with no other mode of travel. The smooth and easy movement of the light craft has made it popular in city parks, but the poetry of canoeing is only learned on the streams and lakes of the wilderness, with the vast and solitary woods standing like sentinels on either hand, and the broad lake or smooth, dark, dead water, broken occasionally by a wild dash down a rapid or a strenuous struggle in poling up stream against a rapid current. The well-known stretches of well-kept lawns are exchanged for the constant surprises of the quick turns of the stream, with the shy and graceful deer, after one startled glance, leaping for the shelter of the woods, waving their white 'flags' not in taken of surrender, but in saucy defiance.

"Who that has ever poled it can forget the musical 'clink' of the steel-shod pole in the hands of an expert canoeman, as, in rhythmic cadence, with graceful sweep of his strong arms, he forces his buoyant craft swiftly up a rocky stream against the rushing water? On a calm day you can hear it a mile away. Clear and bright, but not sharp, it drops through the still and sunny air like diamond points of music."

ST. JOHN'S, Newfoundland, Oct. 15.—*Editor Forest and Stream:* I rise to indorse Mr. Hardy's sentiments on Kipling's verses quoted by Mr. L. F. Brown in your issue of September 26. Mr. Hardy's description is so appropriate that I quote him verbatim, except a small substitution of my own. He says: "I have been familiar with the scenes Mr. Kipling is describing, and I thought when first I read it, and still think the same, that there is no description in the English language which so vividly, briefly, and truthfully tells the story of logs and water." And he may truthfully have added of the spring freshet, ouananiche, sea trout and life in the woods generally. If Mr. Hardy would substitute Newfoundland instead of Maine or Canada, I'll guarantee to get a cloud of witnesses to indorse his sentiments of Kipling's verses in every particular. I thought when first I read the poem of the "Feet of the Young Men" that Kipling must have meant particularly Newfoundland. Of course, it was a picture evolved out of his inner consciousness, enriched with the experiences and sympathies of a profound lover of nature, limned by a master with the "seeing eye" and the "gift of song." The line,

"Where the sea trout's jumping crazy for the fly,"

is, to my own knowledge, the most accurate and graphic description in the language of how sea trout act when they are "fresh run," and when you angle for them at the proper time and place. As for the "bar of sun-warmed shingle, where a man may bask and dream," I have dozens of times basked and dreamed, and boiled the kettle and smoked a pipe, and had a snooze on a sun-warmed shingle.

If you ever arose at 2:30 in the morning to get to the falls for the morning's fishing—the hours before and after the dawn—and then whipped the river for a mile or two till 8 or 9 o'clock, with your basket full and your stomach empty; then when the sun mounted high as you began to feel the heat, and the flies and the hunger, you instinctively cast your eye around for the "sun-warmed shingle," and started the fire. With a good photographic instrument, a painter's palette, a rhyming dictionary, and a select committee you might evolve a graphic and truthful picture, but in comparison with Kipling's epigrammatic word painting it would be as "moonlight unto sunlight or as water unto wine."

This poem was written by a man who loves nature, who sees it with a keener insight than the average uneducated eye, who feels and throbs and thrills with its ever-varying phases, and who, above all, possesses the divine gift of "singing as he sees." Any sportsman at random can cull a line from the poem that will be a complete description in itself of any phase of shooting or fishing.

With Mr. Hardy, "I would not like to make any animaladversions upon Mr. Brown's criticism" of Kipling's verses. It appears to him differently from Mr. Kipling or Mr. Hardy, but if Mr. Kipling had been short-sighted enough to localize what was meant for a universal picture of what happens to a victim of spring fret, I'd say that he should have labeled it Newfoundland, and then there is "no question," as Mr. Hardy puts it, but he might have been passed *summa cum laude* on every point.

NEWFOUNDLANDER.

Editor Forest and Stream:

I am full of gratitude, and ask your good leave to voice my feelings.

When I read, in the issue of Sept. 23, the remarkable attack of Mr. L. F. Brown upon Kipling's "Red Gods" lines, I laid the paper down with a sigh.

"Alas!" thought I, "thus do the fair dreams of our youth vanish away; thus are the pins ever being knocked from under our fondest illusions!" And I was sad, and would not be comforted. For, I had theretofore looked upon those lines as the ultimate expression of the call of the wild, which finds so wide a response among the readers of FOREST AND STREAM—as an inimitable word-picture of the wilderness of which I dream often, but may, alas! visit so seldom in the flesh.

But no more was I to enjoy the lilt of that matchless description, to which I had responded so gladly, for was I not told—in print, too—that the lines were the work of a "quack of error," and many other things too horrible to repeat? And with details and cross references to boot. Egad!

So for two weary weeks I was left to mourn and muse upon the emptiness of all human joys. Then came a ray of hope, piercing the dull gray clouds of despair. Mr. Hardy, who lives in Maine, the home of the racing stream, the log-jam and the canoe pole, told me some facts which made me think our dogmatic and analytical friend might not be infallible. I began to sit up and take notice again. And now comes Mr. Ames, with his summing up of the case on the evidence, and the restoration of my faith is complete. In vain does Mr. Ashcroft threaten to consider me ludicrous if I accept not as unanswerable the "criticism" of his friend, Mr. Brown. Reason has climbed back on her perch and resumed her sway, and I shall return to my first love, utterly disregarding the gentleman's foot-rule and square and eke his microscope, which shows him not only the "texture of bark" of a tree, but, apparently at the same time, the "anatomy of muscle beneath." (And, by the way, isn't that last paragraph of Mr. Ashcroft's, on the qualities of error, rather a boomerang in the hands of one who is but fallible, as all men are?)

I want to thank those gentlemen who have come to the rescue and restored to me a gem that was so nearly swept away beyond recall by a torrent of words.

It is true that I knew, through personal contact, of bars of shingle, bars of sand, as well as bars of "alluvium earth-sediment," otherwise mud banks; so that portion of the "criticism" did not greatly disturb me. But, to my sorrow, I am not up on canoe poles and log-jams. Consider, then, my feelings when Mr. Brown solemnly proclaimed that no canoe pole, from Sand Lake, even unto the ends of the earth, ever was, or might, could, would or should be shod, and that log-jam was only another name for a rainbow, and, therefore, a log-jam could not possibly contain any right angles, or angles of any sort, and would, of course, be most inaptly described as "raw." What, then, was left for me but to abjure that poet and all his works, and thereby lose much that helped to brighten my journey through the vale?

Now, let there be rejoicing! The facts and photographs of Mr. Hardy have cleared up all these questions. The word of a man who has seen and heard hundreds of shod canoe poles is convincing as to their existence as against the statement of one, or of many, who have not seen them.

FRED. D. BIDDLE.

PHILADELPHIA, OCT. 19.

Editor Forest and Stream:

Mr. C. H. Ames joins Mr. Hardy in denying the justice of Mr. Brown's scathing criticism of eight lines of Kipling's "poem," "The Feet of the Young Men." Mr. Ames reminds us that the "poem" has "just been made available again in a new volume," "The Five Nations." He wants the issue broadened by the publication in these columns of the entire "unerring" "poem," so that his defense may not be confined to consideration of the eight lines criticized. FOREST AND STREAM reminds him that copyright restrictions prevent this. Mr. Ames should know that Kipling has the reputation of refusing publication of any of his "poems" on which he cannot collect a royalty, even if it should be a free ad for him.

I invite the two Maine letter-writers to read carefully the recent editorial criticism by the New York Evening Post of this very volume, "The Five Nations." These eight lines appear in that volume, which is merely a col-

lection of miscellaneous verses on a number of subjects. As only the eight lines criticised are under consideration, I do not propose to enlarge the issue and claim an entire absence in this book of anything that could justify or excuse its pompous title; nor that this very "poem," "The Feet of the Young Men," could with equal truth and no more absurdity have been called their heads, hearts, toes or livers. Very few of our young men actually fish and hunt, as compared with the number of those who do not—more's the pity. In point of fact, not one young man in five hundred joins leisure and inclination to camp and use a canoe. Yet Kipling says, by inference, that all young men are "going" to camps in the woods. Nor can I properly take up the balance of the "poem," line by line, and claim and demonstrate it to be further misdescription and misassumption of vague, unspecified, mystic "knowledge." For all this is not in issue here.

A forest that has been ruined by fire is a pitiful, depressing spectacle. These New England gentlemen say, in substance, to the critic: "You write from Sand Lake, Michigan, so you are an ignoramus about camps and beds and canoes. You say you have never seen any blackened timber. Then you have never been in Maine." The critic said nothing of the kind. He said it would be difficult to crowd into Kipling's eight lines of "poetry" more of misdescription. He challenges Kipling's "accurate" "sweet" choice of "blackened timber" (a nightmare spectacle and environment) as a place pre-eminently felicitous for a camping site—one to which sportsmen are irresistibly drawn, and affording an exquisite view especially adapted for "dreaming." And when he charges Kipling with trying to sit and "bask" on an impossible "bar of shingle," they ask if the critic "never heard of a sand-bar?" This is all fog. Sand is not "shingle," nor is gravel of ordinary size. "Shingle" is a waste of small, water-worn stones that no stream ever threw up into a bar. The mixed sand, mud and dirt that alone can be coaxed by a stream into forming a bar, have been washed away from and have left the "shingle."

In the eight lines under criticism, about the only correct adjectives are "blackened" timber, "silent" Indian, and "racing" stream. To be in consonance with the other misdescription, these should have been "soot-charmed" timber, "fairy" Indian, and "bitter" stream.

Mr. Hardy and Mr. Ames are manifestly mesmerized by the mystic halo with which their optics envelop Mr. Kipling, for they consider it sacrilegious to criticise any of his productions on account of the divinity hedging about him. Mr. Ames even lectures FOREST AND STREAM for permitting a legitimate literary criticism.

Both these gentlemen take what they consider to be the weakest statement by Mr. Brown, namely, that almost no real canoe-poles are shod, and when they are, their impact on the bottom of a stream several feet below the surface of the water cannot be heard "around the bend" of a noisy "racing" stream; and, after denying this, they argue that they have proved it to be error, so all the rest of the criticism must be error.

No genuine sportsman, being poled up a stream, would submit to the annoyance of a "click" every few seconds that could be heard a hundred yards away, and that "telegraphs like railroad iron," and would drive the fish away from his flies and scare away all game "long before the canoe comes in sight."

Neither the FOREST AND STREAM nor its readers care anything for sparring. They want facts. If Kipling was a mountebank and fakir blowing his own horn falsely when he wrote the eight lines criticised, they want to know it. So, as a matter of interest, a circular letter will be addressed to sportsmen who have used canoe poles in India, Norway, (some replies are already held as to these), Australia, Finland, Alaska, the Provinces of British Columbia, Ontario, Quebec, New Brunswick, and Cape Breton, Newfoundland and Labrador, besides several points in the Upper Amazon Valley. The replies will be tabulated and submitted to you for publication without comment. This will be fact for your readers, not "Red Gods" nonsense. All this will, however, occupy several months' time.

If this inquiry results in showing that Kipling was not a fakir when he wrote the nine words "to the click of shod canoe-poles round the bend," your readers will realize it. But that will not affect the correctness of the remainder of Mr. Brown's criticism.

R. W. ASHCROFT.

NEW YORK, OCT. 17.

Natural History.

More Quail in Town.

I WAS much interested in Mr. Carney's little sketch of the advent of a covey of quail to town. To hear the gathering call of the quail from the shade trees around one's residence certainly would make one feel that the game millennium had arrived when quail and sparrow would war for a living. One evening this week my boy came running to me breathless and excited, as I was enjoying the glint upon the horizon of the fast receding sun. "Prairie chickens! Prairie chickens! Two of them just alighted in the weeds near the tennis court." I smiled and asked, "Are you sure they were chickens and not quail?" "No, too big for quail," and with that he started again for the weed encircled tennis court to kick them up. The birds had pitched for the night, and the boy did not succeed in routing them out.

I cut short the following up of the subject as to whether they were chickens or quail by agreeing to allow the matter to rest until daylight, and let the birds settle it themselves. And sure enough, with the first rosy tinge on the horizon came the call that, when once heard, "can never be forgot"—the co-ee, co-ee of the calling quail. My boy was awakened in time to hear the last note, and he exclaimed, "You were right, pa, they are quail." He, too, knows. And what a mental transference to prairie, slough, stubble and woodland does the honk of the goose, the quack of the mallard and the call of the quail bring about! As the honking gander-led V high up in the heavens cleaves its way southward, the honk! honk! honk! coming to

you as clear as a bell from the clouds above, how easy to imagine yourself in your pit on the stubble, crouched low, surrounded with decoys and listening with throbbing heart to the nearing honk! honk! of the approaching and confiding flock!

You dwell on every note of the passing flock high overhead, as if it were from the throat of a Patti at \$10 per. You listen and watch as the moving specks upon the heavenly background, until the flock passes out of your vision, and you yet faintly hear the honk! honk! after your eyes have failed you. The staccato quack of the wise and wary mallard brings you back to the rice-grown slough. You sit motionless in your boat as the old greenhead leads the flock in circles toward your wooden lures. Two quick, sharp and smokeless reports, and a pair of greenheads fall as lifeless as the wooden decoys that drew them to their destruction.

And where does the call of the quail carry you? Through golden stubble framed in by scarlet woods. Through willow swamp and sere and yellow grass fields. Along hedge grows dividing green pasture lots. Through brier and sumach grown dells. Along southerly exposed hillsides among the birches, hickories, maples and chestnuts and in brier grown fence corners, where they love to lie up during the middle of the day and bask in the sun. But much as I would like to wander—with my lead pencil—through valleys and over hills and now and then bringing to bag a partridge, woodcock or quail, yet must I desist, for the train is on time and the porter is awaiting me with his whisk broom, for we are within the city limits of Chicago.

CHARLES CRISTADORO.

That "Apple Bird."

OAKLAND, Oct. 12.—*Editor Forest and Stream:* I have been so busy since my return from the Klamath Lake outing that it was the latter part of last week before I got to the number of the FOREST AND STREAM containing Mrs. Fannie Hardy Eckstorm's analysis of the Siskiyou "apple bird" mystery, and I was pleased to learn that she was as greatly puzzled and interested as I was in its solution. I had never posed as an ornithologist, but I was always interested in birds, and after more than sixty years' experience thought that I knew something of most of the more important ones in our own land; but when last summer I struck that northern depredator that I had never seen or heard of before, it took the wind all out of my sails, to use a nautical expression; and I determined to ventilate even though it gave me the suspicion that I might be relegated to the same category as was the man who heard of the failure of a certain bank and was in great distress for fear of loss until he had hurried home and examined all his purses and security boxes, and finding he had no bills on that bank or any other felt much relieved.

I knew that the family of woodpeckers was not large, and although ashamed of my own ignorance felt sure that an appeal to the FOREST AND STREAM would make the matter perfectly clear if the account was aided by even the briefest description of the bird; had there been any doubts in my mind upon this point I should have forwarded the skin to assist in the identification.

Failing in this, the next best thing was to find that it puzzled better authorities than myself, and, like the bank fellow, I felt much relieved.

Mrs. Eckstorm's article was exhaustive and very interesting, but working, as was necessarily the case, from very uncertain premises, she was, as far as I am able to judge, wrong in all of her conclusions; at least I cannot harmonize them with which I am cognizant. As I understand it, she decided that I either shot the wrong bird or was culpably careless and incorrect in the description. Bearing in mind the fact that I went to the orchard early that morning expressly to identify the bird if possible, I will take each hypothesis in its order.

When I approached the trees there were fifteen or twenty of the birds already there, and no other birds of any other kind were in sight, and it was seeing one of them light on the side of a post that made me quite sure that they were woodpeckers. They were not in a flock, but scattered about everywhere among the trees, and from their plumage could be recognized as far as they could be clearly seen. Long before I got into the orchard I was as certain that they were the depredators as I would be to see a flock of crows rise out of a field where they had been pulling corn in early spring. Every action denoted the mischief they were engaged in. As I approached they all flew toward the forest, but I killed one of them from the top of a cottonwood tree, although I stood under an apple tree when I fired. My first step was to make myself still more sure that they were woodpeckers, and I did this by examining the ends of the tail feathers, where I found the stiff, bare points which, to the best of my knowledge, distinguishes this species from all others.

I then returned to the house, taking the bird with me, where it was instantly recognized by the whole Woolmin camp family as the "apple bird," and as the men were killing more or less of them nearly every day I considered this point definitely settled. For at least fifteen minutes I had it in my hand and carefully examined it, taking down in my note book the brief description I sent you; brief for one reason because the plumage had but two colors, black and a dull red shade, nearer the color of an ordinary red brick than anything I can think of.

Nearly, if not quite all the birds of this species that I was acquainted with had bright red feathers on some part of the head or body, but the "apple bird" had not a feather of any other color except the two mentioned. The breast, with the exception of the belt, was black, although destitute of the gloss that marked the back and wings, and in this respect they resemble the crow or raven, the brick colored belt about an inch wide began at the root of the bill and went without much change in color and in width to the root of the tail; a few small feathers of the same color were visible mixed with the black all around the eyes. The body I judged to be about the size of a robin, although its head and neck were, of course, larger and stronger.

These are facts just as they came under my own observation and admit of no twisting or speculation.

Now for the hearsay section. It was Mr. W. that assured me that they husked and eat the corn, and that the invasion came from the south, although I mentioned the fact that I had never seen or heard of them there, he still seemed to have a decided opinion upon that point. He also said that they infested all the orchards from Agar to Klamath Falls, but were much worse on some ranches than they were on others. Of these three assertions the only one that admits of any doubt is the second, and it is quite possible that upon this point he may have been mistaken. But nothing is more certain than that the birds I have just described are there at the proper season, and as Mr. W.'s ranch is on the main road, only eight miles east of the railroad at Agar, they could be easily investigated.

FORKED DEER.

The Carcajou.

Editor Forest and Stream:

In the issue of FOREST AND STREAM of Sept. 12, a couple of paragraphs are printed anent "The Carcajou," one seeking information and the other in an honest effort to elucidate. Now, if there is one thing more than another that I know anything about, or at least I think I do, it's the carcajou or corcajou. And in my travels and researches I found a whole lot of people who thought that they knew what a carcajou was, but were woefully ignorant on the subject. I spent money, time and pains in my search for knowledge regarding this animal and its name. I became aware of the fact that prominent writers on natural history, eminent professors, and even dictionary makers were lamentably ignorant on the subject of the carcajou. Capable writers have also attempted to invest it with mystery, as if it was a very rare brute of almost fabulous ferocity.

Your assertion that carcajou was a name given to several species of carnivora is correct, but the word carcajou should never be applied to the cougar, Canadian lynx or badger, nor any other animal than the wolverine. It belongs strictly to the wolverine. It is a French-Canadian corruption of the old French word signifying glutton, and in Canada is always applied to the wolverine. And it is rightly so, for that quadruped is in every sense a glutton, and that cannot be said of the cougar, lynx, or badger. The last three animals know when they have got enough, but the wolverine seemingly never. In fact, I have come to believe, almost, that the wolverine goes foraging even in his sleep, an eating somnambulist, as it were.

The wolverine is a wolverine wherever you find him, whether in Canada, New York, Michigan, Alaska, or the Arctic division of the southern Rockies. There may be some little difference in them as distinguishing those inhabiting the woods or forests of the lowlands from those who are at home in the high altitudes of the mountains, but there is, if any, very little difference. They are nearly all of a color and marking, and of the same size and structure, as well as of habits. I did see a wolverine in Utah once that was a pure albino, and which I believe is the only instance on record of such. And from what I can learn the wolverine of northern Europe and Asia are almost the same as the American animal. He is exactly the same when it comes to an appetite. Many spurious stories have been put into print as to the wolverine's (carcajou's) prowess, cunning, and habits. But if the simple truth were told of him, he would still be a very interesting creature.

One bit of misinformation that has gained general circulation is that the wolverine is a cross between the bear and wolf. He is of neither. The wolverine belongs strictly to the weasel family. In the Zoo at the Shutes in San Francisco are a couple of long-tailed, high-legged animals labeled "Siberian Wolverines." But they are no more like the true wolverine than the Reliance is like a tugboat. The wolverine is low, squat, rather longish, with a short, flat tail, and quite short legs, rather more like those of a dachshund than those of a greyhound or wolf. Some people might at first sight liken the wolverine to a bear, and he might, it may be admitted, resemble a very dwarfish bear, but he has none of the habits that characterize the bruin family.

I have seen carcajou also spelled corcajou, and karcajou, and in descriptions I have seen where writers have gotten the karcajou mixed up with the kinkajou, a totally different animal altogether, and one residing in the hotter portions of South America! The carcajou, on the other hand, belongs to latitudes and altitudes where snow falls at least in winters.

If Mayne Reid ever wrote of the carcajou and wolverine as two different beasts, he erred, but the error would be a pardonable one, for in the Rockies the term carcajou is applied often to the panther, but in such cases it is clearly in ignorance of the real meaning of the word. Carcajou, wolverine and glutton are synonymous when referring to a North American animal. Calling a jaguar, lynx or badger a carcajou does not make any one of them a wolverine, even though they may at times be ravenous or voracious.

I recall a saying attributed to Abe Lincoln which I think is appropos to the subject in hand. Somebody was trying to convince Abe against his own hard good horse-sense on some matter or another, when Abe asked: "Calling a sheep's tail a leg, how many legs has a sheep?" "Six" was the prompt reply. "No," says Abe, "you're wrong. Calling a sheep's tail a leg does not make it a leg." Let us apply such common sense to nomenclature in natural history. And it is due to the general public that writers and the conductors of newspapers and periodicals see to the keeping pure of our language, and prevent the induction and the perpetuation therein of errors and untruths.

That majestic animal of the plains, prairies and savannahs, now all but extinct, went down into history labeled and libeled the buffalo, when its true name was the bison. All authorities are agreed that the animal is a bison, and not a buffalo, yet magazine editors, lacking the moral courage to wield the blue pencil properly, permit the word buffalo to go into print where it should be bison.

WM. FITZMUGGINS.

[Perhaps our correspondent will tell us what is the "old French word signifying glutton." The etymology of the name has been much discussed in the past.]

Submission of Animals to Surgery.

Editor Forest and Stream:

Within a short time publications have appeared in several journals detailing with more or less completeness, instances where wild animals have submitted themselves to surgery or medical treatment, with apparent understanding of the benefits to be later enjoyed by them. This proposition is by no means new, being as old as Aristotle—skeptical that he was concerning most superstitions—or even Æsop, but it seems to have taken on new life, as a part of the humanized *Natural-Philosophie* to which so many popular writers have lately contributed.

Let us examine shortly certain assumptions which must be made before such relations can be accepted as true. It may be conceded that some domestic animals, notably the dog, occasionally do submit quietly to minor surgery inducing pain, but here the mental condition involved can be accounted for by much the same course of experience as that which has led to a like state in human beings. The dog is accustomed to regard his master as his protector and his refuge in time of trouble. He trusts him, and when he comes to him holding up a hurt paw—as the story usually has it—he merely exhibits confidence, but a confidence so empty of any defined conception of what is going to follow to his benefit, that it may be questioned whether it should not be classed as a reflex, organized by generations of experience—and nothing more.

But obviously no such course of experience can have come into the mental history of wild animals—at least before their entry into menageries. On the contrary, the course of nature has been away from curative methods. Nature cares nothing for the sick or the hurt. Her need is for those too healthy to become ill and too strong and skillful to be injured. Her judgment is that of the Roman amphitheater—the wounded must die. Under her methods there are no prizes for therapeutics or surgery, and there is no real evidence that under nature, animals ever knowingly practice either.

The relation of pain in the animal economy must also be taken into account. The function of pain is obvious enough, under any philosophy which undertakes to explain it. It is just that of the rattle of the rattlesnake—or, rather, it is the subjective side of that of which the rattle is the objective—a warning of ills to be avoided. It and its offspring, fear, are what animals flee from. It was the first sensation concerned in developing the instinct of self-preservation, one of the two fundamental instincts of organic things. Is it imaginable that innate aversion to its greatest evil can be at once overcome through an effort of will, by an animal, merely upon the mixing into its affairs of an unknown, two-legged creature, which is probably to it the greatest mystery of its existence? Those who have had the experience which is left for few men in these later days, of meeting with genuine and uncontaminated savages, know the mistrust with which such a people look on curative pain. Is it conceivable that a greater power of abstraction is present in apes and monkeys, in lions, tigers and the like?

So much on the logical side! Now, what occurs in practice, and by uncritical observers is translated into submission with understanding of purpose, is this: When wild animals have to be secured for surgical or other treatment, a time usually comes, after a struggle, when ropes and straps are adjusted and drawn tight. In most cases, at this point the subject relinquishes the fight and lies quiet. How much of this state is due to recognition of helplessness, and how much to excess of nerve and muscle strain, is not easy to determine, but all are doubtless present. But the first is probably the chief element, for if the bonds are in the least degree relaxed, in most cases all conception of the value of surgery vanishes, and the struggle against constraint begins over again.

When this passive and temporary condition exists, the only thing necessary to turn it into an example of submission with understanding, is the presence of a human observer who has not yet learned the primary need of the student in animal psychology: that he shall forget all about the perceptions and reactions of his own race, while he is engaged in interpreting those of lower animals.

ARTHUR ERWIN BROWN.

THE ZOOLOGICAL GARDENS, Philadelphia, Oct. 17.

The Bird and the State.

IN the forthcoming annual report of the Forest, Fish and Game Commission of the State of New York, Mr. Frank M. Chapman discusses very interestingly the economic value of birds to the State. Mr. Chapman, as is well known, is a long time student of birds, and is Assistant Curator of Mammalogy and Ornithology in the American Museum of Natural History, and writes not only out of abundant knowledge of his subject, but also in very pleasing style.

He takes up the question of what the bird does for the State, pointing to the services they render by eating harmful insects, eggs, and larvæ, by eating the seeds of noxious weeds, by devouring small mammals which injure crops, and by acting as scavengers. He indicates the relations of the bird to the forester, the fruit grower, the farmer, and finally the citizen at large, and in view of all these services asks what the State does for the birds, and advises what it should do.

For a long time now the economical ornithologists have been striving by a study of the food of different birds to determine what species are useful and what harmful to man. Much has been learned, but by no means all. In many cases, if not in all, the problem is a complex one, requiring deeper study than has yet been given it. At the same time it is clear that the vast majority of birds have a distinct service to perform for man and that they perform that service well, and the work of bird protection in which Mr. Chapman and his associates have played so important a part cannot be applauded too highly.

This paper is worth reading, not only for the interest-

ing matter which it contains, but for the beauty of its illustrations. These are by Mr. Fuertes, the great bird-painter of the day, and each deserves a frame. Among the species figured are the red-tailed and Cooper's hawk, screech owl, black-billed cuckoo, three species woodpeckers, three of flycatchers; there being about a dozen plates, all of them representing familiar and useful birds.

It is evident that the proofs of this interesting paper did not pass under the author's careful eye, for there are too many typographical errors, both in the English and the Latin words.

Mr. Rhoads' Paper on Elk.

Editor Forest and Stream:

As to elk traits, habits, behavior or habitat, food, dispositions, etc., the article in the *FOREST AND STREAM* of Oct. 17, reprinted from the notes of Samuel N. Rhoads, is by long odds the most valuable and comprehensive treatise on elk that I have ever seen: a most valuable contribution to natural history.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

American Game Birds.

II.—The Ruffed Grouse.

FROM the time when the mind of man runneth not to the contrary in matters of shooting for sport, the ruffed grouse, by common consent, has been classed with the most difficult of game birds which the sportsman endeavors to bring to bag under the approved conditions of sportsmanship, if indeed it be not the most difficult of all. For it taxes the sportsman's nerve, patience, skill, woodcraft and endurance as no other bird taxes them and as no other bird can tax them; and all these requirements are necessarily supplemented by a gun of good killing powers, one selected with special reference to cover shooting; and last, but not least, a dog of more than ordinary intelligence and good intent and good training, if the sport is to have any successful results and pleasing finish in its action. If any element of the sportsman's ruffed grouse craft be missing, success is marred accordingly.

The ruffed grouse in every art and article is a bird to fill the sportsman's ideal—its habitat is in nature's most picturesque setting; the bird is beautiful in its delicate tracings and markings, and rich and varied in its colorings; racy of form and faultless in symmetry; wild, dashing, daring, alert and infinitely resourceful in its crafty devices when pursued; exclusive in its habits, and withal a bird of rare excellence for the table, its flesh being of delicate texture and pleasing flavor; so palatable, indeed, that it is by many epicures more highly prized than is the flesh of any other game bird. With those who may vaunt the excellence of the woodcock, the snipe, the prairie chicken, the duck, the turkey, etc., it also holds a high place in their esteem; and the exceptional man, whose fancy for one particular kind of bird prejudices him against all others, will not speak unkindly of it. And yet, delicious as it is when properly prepared for the table, it can easily be spoiled by ill cooking, and of bad cooks there is no end. The art of cooking it properly is quite as rare as is the skill of killing it properly. If it be cooked too much or if it be cooked improperly, it loses much of its rich delicacy of flavor and texture, and becomes dry and unpalatable; and in that unfortunate condition it probably was when that eminent authority, Wilson, partook of it, and thereafter, in his "American Ornithology," wrote of it: "At these inclement seasons, however, they are generally lean and dry, and, indeed, at all times their flesh is far inferior to that of the quail or of the pinnated grouse." Yet, as tastes are not all alike, the superlative will probably be placed according to individual fancy in matters of food as in all other matters, and it is well that it is so. If all fancied alike, all would be monotony. Nevertheless, a man who cannot have a culinary spell cast over him by a skillfully cooked ruffed grouse, it having been kept a proper length of time after killing—not too long—has no music in his soul and may not be even fit for treason and spoils.

For its home the ruffed grouse prefers the country above the snow line, in its rough and timbered sections, for it is strictly a bird of the woods and thickets, preferring the roughest parts of a hilly or mountainous country, and of these it many times selects the densest recesses; or the timber of seamy and rocky hillsides; or where ledges, fallen tree trunks and tree tops in the woods secluded from man guard against intrusion; and even the timbered swamps are not obnoxious to it when it seeks a habitat free from the incursions of man.

For man it has the most uncompromising aversion. It selects its habitat in the places least frequented by him, though once the habitat is determined upon it holds to it with dauntless persistency, let the gunner disturb it as often as he may.

In choosing its habitat it prefers that it be near a supply of good water and an abundance of good food, for it is a good feeder. Whortleberries, blackberries, beechnuts, acorns, chestnuts, partridge berries and buds are readily accepted as food in their proper season.

The bud of the laurel is said to render the flesh poisonous for food purposes, though the belief seems to rest more on tradition than on any direct evidence.

The habitat of the ruffed grouse is in the timbered country from the Atlantic to the Pacific, bounded on the south in an irregular way by suitable habitat and the snow belt; and on the north into British America to a line not definitely determined, though, as a matter of course, all timbered or rough country within the region mentioned is not necessarily good ruffed grouse country. Some sections have been stripped too much; some have suffered from the worst of all despoilers, the snarer; while others, to all appearances favorable, are not frequented by it.

Unlike the quail, which loves to make its home near the homes of man, and the prairie chicken, which sticks closely to the grain fields, the ruffed grouse is ever intent on choosing its home and haunts distinctly apart from those of man. In the East it is called "partridge"; in sections of Pennsylvania, "pheasant."

In the breeding season, when it has been free from pursuit and harassing alarms, it sometimes strays a short distance from cover into the adjacent fields, where grow palatable huckleberries and blackberries, though rarely venturing further than a short flight, and often but a few yards from cover.

Though always a wary bird and ever avoiding man, it is not so wild and quick to take wing, before the frost, and unsettled weather of fall set in, as it is afterward; and if the gunner disturb it once or twice, the full wildness of its nature and its constant alertness to avoid man are fully and permanently aroused. Then man and the places he frequents are shunned as much as possible. Indeed, it is not a social bird with its own kind. After the young birds have matured, they separate and, in the fall, the gunner will find them in ones and twos, and at rare times in threes.

Given to the sportsman the conditions of an open field and therein a ruffed grouse on the wing within range, then the difficulties of killing it are but little if any greater than those which obtain in the killing of a prairie chicken on the open prairie, though whether in open or cover the ruffed grouse is always swift and decisive in its flight. But in the open, whether it be on field or prairie, there is an even light and an unobstructed view. Then for safety the bird can rely only on its swiftness of wing, all too slow when pitted against the sportsman who can, under those circumstances, with studied quickness or deliberation, command a large circle around him. Thus the ruffed grouse is at a fatal disadvantage when shot at in the open field, as is also every other bird pursued under the same conditions; but these conditions are rare indeed in ruffed grouse shooting, for, as mentioned before, it ventures into the open only on such infrequent occasions as it is tempted to search therein for food, and then only in places seldom invaded by man, where it fancies there is freedom from pursuit. To all fixed habits there seems to be an exception for a short period in the fall, when it is subject to a crazy waywardness.

While in the open field it is strong and swift of wing, in cover it is at its best. It will on occasion dash through the densest thickets with apparent ease, with no diminution of its swiftest speed, seemingly having a charmed manner of flying through tree tops and thickets as if they were but phantom trees of the woodland, or shadows offering no obstruction to its onward flight.

And in its favorite haunts it is a master of the art of self-defense. It can utilize thickets, trees, old fences, ledges, stone walls, swift wings and endless cunning to evade its pursuer. Be the position of the shooter what it may in reference to this bird in cover, it, when flushed, takes instant advantage of the nearest thicket, or the trunk of a tree, or old fence, keeping one or the other between itself and the gunner in its line of flight, thus in a great measure blocking all opportunity to shoot, or at least hampering the shooter greatly and oftentimes causing a miss.

The bird, in most instances, times its rise so as to have the advantage of some nearby object as a shield to its flight. On occasion it will display a courage bordering on audacity, permitting the shooter to pass close by and flushing after he is some yards further onward. This wile is oftenest practiced after it has been flushed, marked down and pursued. Both man and dog are apt to pass it then, though they may follow in the exact line of flight. The shooter may hear

the irritating roar of the bird's wings behind him, on ground but a moment before passed over, or catch a shadowy glimpse as it dashes away from some tree top.

Owing to its short flights and its proneness to take a straight or nearly straight line, the persistent shooter may be able to mark and flush the bird again and again. It sometimes in repeated flights, returns to near the place where it was first found, and it always takes the flights so that ground and cover are to its advantage in avoiding danger.

Once in a while a fool bird will be found, which will do the very thing it ought not to do, commonly paying for the lapse with its life; so that if there is anything in the theory of heredity, the ruffed grouse should be uniformly of high capabilities, the fool birds being killed promptly and never breeding.

By far the greater part of the shooting is at close range, as it needs must be in thicket or woods, where the longest views are short and obstructed by trees, or ledges or the undergrowth, or the hilly nature of the ground, where in the early season the view may not be greater than a few yards or feet if the leaves have not fallen.

It then is not an infrequent occurrence that the shooter will hear the startling whir of wings close by him, and yet be unable either to shoot or to mark the bird's course from inability to see the bird at all. The light of the woods, broken and broken again as it is through the irregular openings in the tree tops and branches and leaves interposing, with here and there shafts of clear light and masses of shadows interspersed everywhere, add a difficulty to quick and clear vision, and therefore to the difficulty of accurate shooting, differing thus from shooting in the open.

The successful ruffed grouse shooter must be ever promptly ready to shoot, and further must be quick of eye and motion. He must instantly decide on the manner of making the shot, taking advantage of all the few opportunities offered, and avoiding the obstructions which interpose. No studied effort at aiming is possible. Cover shooting of all kinds requires quick action, but ruffed grouse shooting requires the quickest. Of all snap shooting, ruffed grouse shooting is the snappiest; and the successful shooter of that bird must excel in that kind of shooting, since in most cases he will have but an instantaneous glimpse of the bird in the unfavorable mixed lights and shadows and cover.

For this shooting the gun should be light, short of barrel—26 to 28-inch—and a cylinder bore, for a full choked gun is entirely out of place in such cover shooting, equally unsatisfactory when it does or doesn't kill, it being a miss in the first instance and often a badly mutilated bird in the second.

The average shooter will find that he has success far below his opportunities even when equipped with the gun most fitting for the work. In this shooting there is no waiting for opportunities to fit the gun.

The successful shooter must take the shots that are offered and as they are offered, it matters not how difficult they appear or how brief the opportunities may be. He may catch but a momentary, shadowy glimpse of the bird as it crosses some diminutive opening, or he may see it for an instant in a maze of leaves and branches, or he may get only a partial glimpse of it and some disturbed leaves in the course of its flight, yet those are the opportunities which are the most numerous and which must be relied on for the bulk of the shooting; in short, that is ruffed grouse shooting.

If the shooter be too indolent or apathetic to be ever ready to shoot, or if he be too slow to take advantage of the opportunities, his success will be but meager so far as material results are concerned, though he may be greatly encouraged by the belief that his last ill success was due to faults in the bird, and that if he can have another opportunity he will acquit himself nicely. The opportunity comes and failure again evokes more excuses. Once in rare while the shooter will have a good opportunity, catching the bird in some corner so favorable that the advantage is with the shooter, but such instances are rare indeed, and by themselves would make but little sport.

To be ready for the opportunities, the sportsman must be quiet and never relax his vigilance, and his gun must be so held that it can instantly be brought into position to shoot. The nerves of the shooter must be constantly at a high tension, in readiness for the rise of the bird and the instantaneous shot. Every faculty must be at a high key. The very moment that the shooter relaxes his attention will be the moment that the bird will rise, and before sportsman can get ready the opportunity is gone. It will be seen that the man who dawdles with his gun, who is slow in the handling of it, or who is noisy, cannot hope for any satisfactory success in shooting the bird of game birds, the ruffed grouse. On the other hand, he can be keyed up to too high a pitch, over-ready when the bird rises. A nervous flurry does nearly as much to disarrange the desired results as does the more indolent dawdling.

There are those, however, who can never overcome this nervous start at the roar of this bird's wings, though they may be perfectly undisturbed in any other bird shooting.

And the skill of the shooter, be it ever so high in degree, must be supplemented by the work of a quiet, well-trained, industrious, intelligent dog, for the shooter is much better off without any dog at all than with one that is riotous, or one that ranges too far, or that is heedless of his work. Loud orders to the dog have no place in ruffed grouse shooting. The sportsman himself cannot observe too great a silence. The human voice, in particular, alarms and puts the birds to flight.

The work required of the dog in this shooting is distinctly different from that required in any other kind of bird shooting, except perhaps woodcock shooting, which in a way it resembles, though a higher degree of dog intelligence and obedience are required, as the ruffed grouse is far more cunning and wary than the woodcock.

The "partridge dog" should not work far from the gun in cover, and he should be silent and diligent in his quest. Many experienced shooters highly commend the use of a small bell tied to the dog's collar, its low tinkling constantly indicating the dog's whereabouts in the thick cover, and, generally, when the bell stops, it indicates that the dog is on point, thus in a way keeping the shooter posted by ear as to his dog's doings and whereabouts.

The rattle-headed, highly nervous dog, or the one which gallops swiftly and merrily about, is distinctly out of place in this kind of shooting. The æsthetic shooter, whose dog must carry a high head and a tail flashing his sides merrily as he gallops and bounds about in the ecstasy of his enjoyment, as the dogs many times do in idealists' tales of great work afield, would better take his fiery dog into the open where he can better disport himself unhampered, and where his pretty ways may be admired without any unpleasant interposition of the ruffed grouse. Such manner of the dog's seeking is incompatible with ruffed grouse shooting, for the shooting should be the dominant feature, not the joyousness of the dog.

A dog of fair gait and persistent industry can easily beat out the necessary range, and the one which makes his quest patiently and soberly and quietly, working with judgment and honesty to the gun, will bring the shooter satisfactory success in the results, to say nothing of the incomparable comfort and pleasure in shooting over him.

Nine out of every ten dogs which are running with high head and merry action are running because they are in high spirits and for their own pleasure, with no thought of the birds or of work to the gun. When they come on birds, such is often a matter of chance and their point work is marked by detrimental errors. This kind of dog leads his partial master to believe that when he wears off the wildness and wire edge he will steady down to a useful grade of work; but often when such dog has worn off his exuberance he has worn off all there is of field performance in him, and he either loafs or does his work in the same slovenly manner, though, loafing, he does less of it.

In shooting for sport, the shooter takes his birds on the wing. Of course, in shooting for market, the market shooter has no thought of sport or its practices. His one object is to kill the bird and bring it to bag. The manner of it is of the least importance. His theory and practice are founded on commercial principles. Therefore, he shoots his birds as he can, whether they are on the limb of a tree, the ground, or flying.

Some hunters have dogs trained to seek for the birds, and finding them, they flush and follow them. When flushed by the dog, the birds generally take to the trees, and the dog, barking, so engages their attention that they fall an easy prey to the hunter, he often bagging every bird in the covey under such circumstances. Often when flushed by the dog they fly to the tree tops immediately overhead where, in fancied security, they calmly watch the dog. The shooter then pops them one by one, taking the lowest birds first. The falling of the lowest ones does not disturb the ones above, though if a top bird is dropped the others fly away forthwith.

As to the number a shooter can kill in a day, so much depends on the shooter's skill, the bird supply, and the local shooting conditions, that they alone determine it.

In some sections of New England two or three birds at the end of a day of diligent effort is considered a highly successful result, and it is not an infrequent occurrence in that section that a diligent day may have no birds at all at its ending.

In certain favored sections of New York, Wisconsin, Minnesota, Dakota, etc., and in the mountain sections where the ruffed grouse abound, such a bag would be considered an absurdity if held forth as an index to good shooting, industry and superior results.

While in North Dakota recently I heard of one bag

of eighty birds, made to one gun in a day, something extraordinary. They were shot at the air holes along the banks of the Red River after it had frozen over, the birds coming to those places for water. This was not recounted to me as a matter of sport, nor is it so set forth here, but will give an idea of the numbers of the ruffed grouse in the sections where it is in the greatest abundance.

But the sportsman who seeks the ruffed grouse for the true sport of it, has a more exalted pleasure than comes from shooting any other game bird. First of all, he must be skillful with the gun, and when he shoots, be he ever so skillful, he can only apply such skill as he can muster in a moment, the opportunities of ruffed grouse shooting being but mere fragments of the opportunities accorded to shooting in the open.

When the bird at length is brought to bag, it represents a toiling through brush and bramble, wooded hill and dale, scrambling over ledges and floundering through swamps, all colored by constant expectancy, unavoidably lost opportunities and seeking to circumvent the birds by cunning woodcraft, supplemented by the wonderful powers of the dog, a degree of cunning, skill and persistent effort, greater than that required in the shooting of any other bird.

It is shooting pitched in the highest key, and that is why I think the shooter can justly feel a greater glow of pleasure when he makes a successful shot at a ruffed grouse, and why he loves this sport above all others, since it tests to the utmost his skill, his woodcraft, his patience, his endurance and his dog; and of the dogs, if he own a good one, he owns one of a thousand.

B. WATERS.

The Maine Game Country.

BANGOR, Maine, Oct. 15.—*Editor Forest and Stream:* As yet the expected rush of sportsmen to the woods of Maine has not materialized, but there are still those who contend that it is early yet, and that the moose hunters will soon be seen in numbers on every train, filling our forests with rifles and the camps with guests. Reports from almost every section of the game belt are that the numbers in camp are far less than last year at this time. The exceptions are those sections reached via the Ashland branch of the Bangor & Aroostook Railroad, which has a wide reputation for shipping more moose than any part of Maine, and as sportsmen generally, who pay the fifteen dollar license, prefer to go where they have some expectation of getting all that the license permits, the business at Ox Bow and Masardis has received an unusual impetus, and the influx of moose hunters is greater than ever before, as one prominent camp owner told the writer a day or two since.

Reports from the Rangeley and Dead River regions are that many of the camps in that part of the State are closed, or closing, since so few sportsmen care to pay the required fee to hunt just deer, that they cannot afford to keep the camps open for one or two. As moose in that part of the game belt are unusual, the hunter hardly hopes for a sight at one, although of course he may be disappointed, now and then.

Were it not for the allurements of the famous Alleghash and other canoe trips, which furnish a most delightful outing, change of scenery every hour and a delightful variety of diet if the trip include a part of September and a part of October, one might almost think the shipments of game would be even lighter than they have been, which up to date is a falling off from the same period in 1902. Within three nights the writer has met five parties at least who have just completed the trip from Moosehead Lake to Fort Kent, and in every case they felt that they had received their money's worth.

People who do not live in Maine can have but little idea of the closeness with which the wild wards of the State touch the borders of civilization. Bangor is a city of upwards of 20,000 inhabitants, yet partridges have been picked up with broken wings or in rooms of houses, where they have either flown through windows or struck the walls of buildings in their flight; moose have been seen within a mile and a half of the post-office, and deer have run through principal residential streets. Hunters need not go two hundred miles to reach the game sections from Bangor, although he who should come here expecting to see all the uncommon incidents above referred to would be bitterly disappointed; he must go beyond this city for his sport.

C. E. Noyes, of Portland, has returned home from a two weeks' visit at Pickerel Pond, only fourteen miles from Oldtown and twenty-five from this city, and while there he saw, in the last week of September and the first of the hunter's month, five moose, and easily shot his limit of deer and a fine lot of partridges.

One of the most happily disappointed parties to go out within the week was made up of R. L. Bond, of Bondville, Mass., E. S. Loomis, of Boston, and H. S. Ludlow, of Troy, N. Y., who had been at Fish Lake. They had a splendid time, shot partridges and ducks until they thought they would never care to eat another duck, and were tired of partridge, while they had no difficulty in securing their quota of deer. On the Sunday before they left for home they saw two moose—but the protection was still on, so they came away without the trophy.

F. A. Guild and John R. Buchan, of New York City, and Henry A. Bishop and W. A. Trubee, of Bridgeport, Conn., are out after a delightful outing at Carr Pond. The water was so low that streams became mostly carries, and they were thus prevented from undertaking many trips planned. But they found birds plentiful, and their limit of two deer showed a buck and doe apiece.

One of the finest bucks to be brought down over the roads leading into Bangor in the first part of the month came down the first day of the moose season. It was a very large buck to be secured so early, and was very attractively antlered, its horns spreading seventeen inches and bearing ten points very evenly arranged. It was shot

by G. P. Stevens, of Orono, in the valley of the Passadumkeag Stream.

Those who think the game all killed off in the woods of Maine, ought to take the Alleghash trip if they are willing to be convinced. One of the parties above mentioned told the writer that they counted deer until it was impossible to keep the record if one was to take note of any other features of the trip. The record kept by another party was, perhaps, an average of the whole. They counted 170 deer within easy rifle shot, which they might readily have killed, not counting those which were merely started but were not really seen long enough to have shot at them. The count of moose was 26, and of these, six were bulls. Two sportsmen just out of the Patten region also report a large number of these animals there, and one man said he saw, just ahead of the season, one monster moose whose antlers were very fine, the frontal horns being very long and having palms, much like the brow antlers of the Newfoundland caribou, although much more massive.

William Einstein and A. W. Mack, of New York, have gone home from their delightful camp on Snowshoe Lake, once the home of the famous Jock Darling, with all the game the licenses allow to their credit.

The first moose to be brought into Bangor this year was shipped out by Frank Osgood, of Boston, and was shot in the Patten region. The same night saw a second moose started from Washington county, but it came only as far as Cherryfield in the same county, being the property of a Cherryfield hunter who had been further east for his sport. The second moose to reach Bangor arrived on to-day's noon train from Aroostook county, shot by Samuel A. Ordway, of Malden, Mass., and still a third came in to-night, the prize of John Graham, of Chelsea, Mass.

Other moose have been shot, among those reported thus far being one secured in the vicinity of Ebeeme Pond, about fifteen miles from Brownville, by P. F. Ham, of Monroe, whose moose was taken home by team. Three Presque Isle men went out after moose the first day and returned by noon of the next day with three bull moose and a deer, a bag for the number of men and length of time that is unlikely to be surpassed if equalled this season.

Thomas F. Strange, of Charlestown, Mass., passed through the city to-day with a moose head, secured by him in the Provinces, he having gone in by way of Fort Kent, across the St. John and to the woods beyond Connors.

E. C. Ostby, of Providence, who visited the Grand Lake region in the spring to try the salmon fishing, has gone back for his fall sport, and sent a buck to his home the other day.

And this reminds your correspondent that there seem to be a great many misunderstandings regarding some of the advantages of the new license law. Express and station agents, and not a few guides, still cling to the idea that all game must be identified at Bangor, whether the game bears the red tag of the non-resident or not, and as a consequence many trips have been cut short, or else sportsmen have gone home with their game to return later and finish their outing. Sportsmen from outside of Maine having bought a coupon for that purpose, which comes as part of the license, may have it attached to their game and thenceforward bother their heads not at all; so far as wardens are concerned it will reach its destination without further attention on the part of the owner. But all owners of game whose homes are in Maine, unless they purchase the special shipping tags heretofore issued for all sportsmen, and permitting them to ship game unaccompanied, must go home with their game or it will be seized.

HERBERT W. ROWE.

In New England.

BOSTON, Oct. 17.—*Editor Forest and Stream:* Deputy Thayer, who runs the commissioner's boat, the Scooter, has arrested two men for pursuing wild fowl illegally on Sunday, in Boston Harbor, and certain specified waters adjacent thereto.

Deputy Nickerson secured the conviction of Mr. G. M. Wilkinson in court at Salem, for violation of the lobster law, and a fine of \$70 has been imposed.

The commissioners inform me that they have commenced the sending out of fingerling trout. They have about 90,000 for distribution this season, including some rainbow and brown trout, besides the common brook trout.

Reports they have received are to the effect that partridges have not been found in great numbers by the sportsmen, but that quail are unusually plentiful.

Mr. C. C. Munn tells me that hunters about Springfield say they have never seen so many quail in that section. In my last letter I said that probably the storm of a week ago would drive many birds in from the sea. A report received from Lake Assawampsett, Middleboro, states that thousands of wild geese have been driven to shelter in the woods and waters about that lake, and many of them and ducks as well have been bagged by the gunners. No doubt the same is true of scores of other ponds in the southeastern part of the State especially. To the hunter who desires good bird shooting along with the pursuit of large game, Lake Umbagog offers special attractions. The lake is easily accessible from Middle Dam. On the first day of the open season several deer were shot not far from the hotel. Among those who are now hunting at Umbagog are Mr. and Mrs. F. M. Ambrose, of New York, and Mr. S. Boothby and wife of Portland. The well-known Boston sportsman, Mr. J. Parker Whitney, his family and several friends, are now at Camp Whitney, on Richardson Lake. Partridges and deer are reported very numerous about Billy Soule's camps, on the Cupsuptic. One of the surprising things connected with deer killing in Maine so far this season, is the large number that have been reported killed in towns outside of the great northern wilderness.

There is a report, too, that even Connecticut is receiving acquisitions to its game supply, and the farmers of Glastonbury are suffering from their depredations. A report in the Boston Herald of Oct. 17, says one of them is to bring suit against the State for damages to his crops, caused by deer.

I regret to chronicle the death of two valued members of the State Association, during the past week. Mr. Edward E. Hardy became a member in 1882, was many years a vice-president, always an active worker for protection, and since 1896, on the list of honorary members. He was a man of sterling character and of genial temperament and will be greatly missed.

Mr. Nathaniel P. Jones, of the firm of Cumner, Jones & Co., had been a member of the Association since 1887, and was greatly interested in its objects. It is but a few days since one of the younger members, Mr. Charles E. Dresser, beloved by all who knew him, was suddenly called to "join the innumerable caravan that moves to the pale realms of shade."

They still live in the hearts of their associates and co-laborers in the cause of fish and game protection.

CENTRAL.

Game Preserves.

Editor Forest and Stream:

Your courteous correspondent, W. M. E., in the October 3 number of FOREST AND STREAM, lays down some propositions on the subject of land tenure in relation to game preserves that I believe cannot be sustained with due regard to the established principles of property rights.

He seems to assume that it is only necessary for the State to pass a law in order to impose any degree of restriction that the "public" may demand upon the right of a landowner to exercise control over his own landed possessions.

It is probable that any such law that should be framed so as to curtail a man's full control over his land, supposing his title to be clear and undisputed, would be pronounced by the courts unconstitutional.

There is a school of political economists who hold that land should not be subject to private ownership at all, but should be as common property as is the air we breathe; that is, should belong to the State for the common use of all her citizens.

The fallacy of this propaganda, as well as that in the contention of your correspondent, lies in the fact, as I conceive, that whereas the land was originally public property, with title resting in the State, the State has divested itself of title by conveying the land to individuals for a consideration, full title to same being qualified only by the right of eminent domain, which the State reserves.

Every landowner derives title constructively from the State; that is, from the public.

If the State conveyed originally unconditional title—that is, all her rights except that of eminent domain—she cannot afterwards reassert any degree of control over the land she has parted with, except to exercise police powers to guard the rights of others from a misuse of the land that might deprive them of the proper enjoyment of their own; as, for example, the abatement of nuisances, etc.

A man cannot close an ancient highway through his land, as W. M. E. correctly lays down. But the existence of such ancient highway presupposes that the landowner or his predecessor has parted with his right to do so by vesting title in the public.

The State can, in the exercise of the reserved right of eminent domain, appropriate private land for public use; but cannot do so without first making full compensation to the owner.

The proposition that "a stranger may mine gold" on another's land "without paying for the privilege," seems strangely at variance with all recognized rules of property rights; and I am constrained to believe that your correspondent is in error in this statement.

Another proposition, that "he himself may not divert a water course within his own boundaries," must be taken with limitations, and with regard to the rights of other individuals, not the State. If the water course runs off of one man's land on to another's, the second man having acquired rights in same as well as the first, then the first man cannot deprive his neighbor of his share of the stream by turning it away from his land, nor out of its natural course. In the arid regions of the West, if an individual acquires land he may consume all the water in a stream running through it for irrigating purposes, and cannot be deprived of the right to do so by a second purchaser who may acquire land on the same stream below him after his right is established. But a third purchaser, coming after the first and acquiring land above him, could divert the stream from him, and so deprive him of a vested right.

The general rule prevails that a man may not divert a natural water course on his own land to the injury of his neighbor who possesses rights in the same stream.

But this is a very different principle from that assumed by W. M. E., that the State can give the right to individuals, or the public, to invade the lands of a private owner.

The principle that property rights in the *feræ naturæ* repose in the State, and not in the individual until reduced to actual possession, has long been established. It probably had its origin in the arbitrary exercise of power by the early Norman kings of England, who asserted ownership over all the wild creatures in the kingdom. We hear nothing about "the king's deer" before their time. But color is given to the rule that *feræ naturæ* are not the property of individuals until reduced to possession by the fact that the wild creatures do not inhere in the land of any individual, having no permanent abiding place, and not being subject to human control; but are on this man's land to-day and that man's to-morrow; so that no individual landowner can claim any other than a transitory interest in these wandering denizens of nature's wide domain. And it is no great strain on the fundamental principle of property rights for the State to assume a restrictive control over these creatures that cannot in the nature of things be considered one man's property more than another's when in a wild condition, the State's intervention being for the purpose of best securing the rights of all in the game and fish that are common to all who can properly gain access to it.

But if the State itself should appoint agents to go on a man's land to reduce to possession the game that it has a theoretic title to, the landowner could challenge the right of the State to invade his premises for such a purpose, and would be sustained by the courts,

Neither can the State, as suggested by W. M. E., dictate to a landowner what kind of use he shall make of his land; or undertake to determine whether he is so using it or not as to afford proper grounds for excluding the public from it. Whether he shall elect to keep it in a forest state for future use, or for the benefit of his children, or shall cut the timber and market it, and put the land in cultivation, it is not a matter in which the State or the public can properly concern itself. The owner of the land must be the sole judge as to what use he may choose to make of his possessions, so long as he does not interfere with the property rights of others; and any interference with this right on the part of the State would open the door directly to a breaking down of the fundamental principles upon which the whole social fabric rests.

I am not a lawyer, and hold myself subject to correction in laying down legal propositions; but a learned legal authority once said that "good law is good common sense," or words to that effect; and I am willing to be judged by that standard.

COAHOMA.

MISSISSIPPI.

"Them Big White Bir's."

PEOPLE who have frequently seen deer in their native haunts and are acquainted with their habits and peculiarities of movement, will be deeply interested and amused at a story, which is told concerning the experience of a prominent physician of Utica, while on a hunting trip in the Adirondacks. The gentleman referred to had never seen a deer in its wild state, but, like most amateur hunters, he had no misgivings as to his ability to recognize the game at sight and he had little fear but that he would be able to bring down the first animal he shot at. The party of which he was a member, all of whom, by the way, were Uticans, went into camp on the bank of a good-sized stream in an unfrequented portion of the wilderness where deer abound, and as soon as possible thereafter hunting operations were begun. As the doctor was not as familiar with that part of the woods as some of his companions were, a guide was assigned to accompany him. The two accordingly sallied forth full of hope that their efforts would speedily be rewarded by the bagging of venison enough to supply the camp. They had only gone a short distance before they reached a locality where deer signs were numerous, and in order to improve their chances for getting a shot, they separated, taking care, of course, not to get far enough apart so that there would be any danger of the Utican becoming lost. The latter, when thrown upon his own resources to some extent, enjoyed the situation all the more and proceeded to hunt cautiously and in what he considered was the proper manner.

While carefully moving forward in the direction which had been agreed upon, he caught sight of an object resembling a large white bird flying rather slowly through the shrubbery with a graceful, undulating movement. He thought it rather strange that such a bird should be seen flying about thus in the depths of the woods, and was intently occupied in pondering over the matter when, to his astonishment, he saw what he took to be another bird of the same kind, though a trifle smaller, flashing through the undergrowth only a short distance away. It exhibited the same graceful, wave-like manner of flight that the other had done, but its rising and falling appeared to be more rapid and it vanished from view more quickly. These incidents made quite an impression upon the Utican, as he could not make up his mind what kind of birds they were that he had seen, unless they were sea gulls, and what business the latter would have in the thick woods he could not cipher out. He concluded to question his guide about the matter at the first opportunity, and see if he could explain it. Accordingly, when the two came together again some time afterward and the guide asked him if he had seen the deer, the doctor replied: "No, I haven't seen any deer, but I saw two big, white birds flying through the bushes in a mighty queer sort of way. Guess they must have been sea gulls, weren't they?"

A peculiar sort of twinkle came into the guide's eye at this moment, but he reserved his decision until the Utican had told all about his experience, and then made the apparently irrelevant remark: "Guess you haven't ever seen many deer running around in the woods, have you?" "No," replied the doctor, "I never saw a live wild deer in the woods in my life, but what has that got to do with those birds?" "Well, them big white birds, as you call 'em, was the tails of two deer. The first one was a big fellow and he didn't seem to go very fast, because he hadn't been scared. The other was a smaller deer, and he was going through the brush to beat the cars, because he had scented you or seen you and knew it was time to be on the move. You see, when a deer is running through the woods he bounds along with his tail up, and that is white on the underside, and sometimes, when the bushes are pretty thick, you have to look twice before you get your eyes on the body of the deer. So you can say you have started up two deer to-day." Now, the doctor had a certain amount of confidence in his guide, but at the same time he placed a great deal more dependence on his own eyesight and judgment, so the outcome of the matter was that he refused to believe that the white objects which he had seen were anything else than birds, and presumably sea gulls at that. His guide, finding himself unable to convince the Utican as to the truth of what he had told him, wisely refrained from arguing the point at great length, but by way of friendly advice, added: "Well, anyway, I don't think you had better tell the boys in camp the story about them white birds."

It is customary for deer hunters on returning from a day's sport to discuss the adventures and experiences which they have had while in quest of game, and usually this confidential talk forms one of the most interesting and enjoyable features of a trip. As might have been expected, therefore, the Uticans were all ready and anxious, on returning to camp that night, to tell about what they had seen and heard during the day. The professional man, utterly ignoring the advice of his guide to remain silent on the subject of sea gulls, made

a point of telling his story at the earliest possible moment, laying particular stress upon the strange and weird spectacle produced by the white wings of the gulls as they gleamed through the shrubbery in the depths of the wilderness. Greatly to his surprise, however, his friends immediately took the same view of the matter that his guide had done, and their unrestrained merriment awakened the echoes in the woodland for miles around. Nothing that he could say would dissuade them from the belief that he had seen two deer and mistaken them for gulls, and from that time forward, as long as they remained in the woods, he was known by the familiar appellation of "White Wings."

W. E. WOLCOTT.

UTICA, N. Y., Oct. 16.

New York State League.

An Appeal to the Sportsmen of New York.

THE shooting season is here, and the many lovers of dog and gun will soon once more start out, to tramp through the swales and covers, where in former seasons, they have spent so many happy hours.

As the season passes, the increasing scarcity of game in places, where at once time fair-sized bags could always be counted on, will probably not infrequently be forcibly brought to the shooter's attention, and the necessity of fostering and caring for our native game birds, and protecting them in their close seasons—if the old conditions are to be brought back, will undoubtedly appeal to many, who have heretofore seldom troubled themselves about such matters.

To such persons especially, as well as to all others, who have at heart the better preservation and protection of our fish, game and forests, we wish to once more appeal and to urge them most earnestly, if they have not already done so, to join either as clubs, associations or individuals the New York State Fish, Game and Forest League.

The objects of this League are to bring together, for concerted action, all those who are interested in the protection and preservation of the fish, game and forests of our State, to procure the enactment of proper game laws when necessary, to promote and enforce the observation of those which are now on the statute books, and to prevent the constant tinkering with, and repealing of measures, which we deem proper and desirable.

Our game laws were never in such good shape as at present. The record of the last Legislature, in passing among other good bills, first, the bill prohibiting the spring shooting of web-footed wild fowl—with the exception of brant on Long Island; second, the bill prohibiting the sale of grouse and woodcock killed in this State; and third, the bill extending the right of search to the counties of New York and Kings (all of which, by the way, were urged and advocated by the League), is a most creditable one, and gives reason for the hope that the people in general are awaking at last to a realization of the fact that our supply of native game is being seriously diminished, and that only strenuous measures can preserve what remains and gradually restore our waters, swales and covers to those conditions as to abundance of fish and game, which most of us remember and all of us long for.

The coming session of the Legislature will, however, undoubtedly bring the usual large number of bills affecting the game laws, the greater part being local attempts to secure special privileges and exemptions from the operations of the present laws; while others are more dangerous ones will be introduced in the interests of the dealers in game and of the cold-storage men, who with a single eye to their own present business interests, can be counted on to oppose all good game legislation and will never lose an opportunity to secure the repeal of any section which in any way affects their business. They have always done this in the past, and will surely not be idle in the future.

To help us to hold what we have, and to properly meet these attacks on our game laws, which are sure to come, we want the assistance and co-operation not only every club and association interested like ourselves in game and fish matters, but of individual sportsmen in every county in the State.

Urge your club or association to join us, and if you have no such organization, try to form one, but you cannot arouse enough interest in your locality to organize a club, join us as an individual.

We need your aid, particularly in influencing your representatives in the coming Legislature, to see that no backward steps be taken; that all good game laws retained on the statute books, and in no cases repealed or modified, in the interests of certain localities.

We want you one and all, and if you have at heart the objects for which the League was formed, a hearty welcome awaits you.

Our next annual meeting will be held at Syracuse, Dec. 10, 1903, and we hope for a full representation from all parts of the State.

Won't you see that your particular section is represented at that meeting, either by an organized club, or by individual sportsmen?

Applications for membership should be made to the secretary, who will furnish the necessary blanks and give any further information which may be desired.

ROBERT B. LAWRENCE, President.

ERNEST G. GOULD, Secretary, Seneca Falls, N. Y.

Moose Every Year for Fifty-three Years.

SOUTH BROOKFIELD, Nova Scotia, Oct. 5.—*Editor Forest and Stream:* Once more I have to tell you of the success of our old sportsman and guide, Mr. W. Crooker. Mr. Crooker, who is a land surveyor, has been very busily engaged all the summer and fall in surveying and running lines, and not a week passed without him coming on the yards of from three to five or more moose in them. Quite often he was within fifty and a hundred yards of them, and not until Saturday morning, 3d inst., did he offer or attempt to get one. This morning he said to his two boys while eating their breakfast about 5 A. M., "This being Saturday, and a fine, ca"

morning, I guess we will try and see if there is any moose about here." One had been up within ten yards of their tent the night before.

So as soon as their breakfast was over, out they went, and when only a short distance from the tent Mr. Crooker gave one call, and in a very few minutes he got an answer, and heard him coming tearing through the woods, making more noise than any steam engine on a railroad, and in a few minutes more the moose was killed. Within half an hour from the time of taking their last cup of tea in the tent, they stood alongside his dead body.

He is a beauty, weighs about 750 pounds dressed, with a fine head and antlers with a spread of fifty inches. Mr. Crooker is now in the seventy-fourth year of his age, and this is the sixth year in succession that he has got his moose the first day out, although he has never failed to get from one to five moose every year since he was twenty-one years of age.

Our local sportsmen have also had remarkably good luck this season. There have now been about twenty moose killed quite near here, some bringing home one and some two, and hardly any of them over twenty-four hours from home before they were enjoying a good fresh steak with their families.

Moose are very plentiful this season. I have not heard of any bears being killed yet this season. Partridges are very numerous.

GEORGE SEAMAN.

New York Game.

POUGLKESPIE, N. Y.—For the past three years quail shooting in Dutchess county has been excellent—so good, in fact, that many old sportsmen say that they never knew when quail was so plentiful. The coming season, judging from the number of Bob Whites that one sees sitting on the fences and hears in adjacent fields while traveling the country roads this summer, will be a record breaker for abundance of these gamiest of birds. A sportsman and friend of the writer whose business takes him to all parts of the county, says that he has seen plenty of birds in every part of the county. And recently, while driving over a country road, he noticed a male bird sitting on a stone wall. The bird was very much interested in something on the other side of the wall. Not wishing to disturb the quail, the gentleman drove past. Returning in a short time to the place, he still saw the old bird there, and all around him on the wall were a dozen or more little fellows. The young birds were just able to fly, and the male bird was probably looking after them.

SNANIWEH.

Currituck Ducks.

WATERLILY, N. C., Oct. 10.—*Editor Forest and Stream:* We are having a northeast storm to-day, blowing about sixty miles an hour, and wild ducks are coming into the sound in countless thousands. They seem to be of nearly all kinds, except canvasbacks and ruddy ducks; it is too early for them. I notice a very large number of widgeon and quite a sprinkling of redheads and blackheads. On Sept. 28 I saw the largest flight of bluewing teal I ever saw at Currituck. They came in bunches of from half a dozen to 200. They came from the northwest and seemed in a big hurry to get south. We have the brightest prospects for good duck shooting. Our season opens Nov. 1, instead of the 10th, as formerly. We have a non-resident tax of \$10, too, I'm sorry to say.

Our quail shooting will be up to the average. We have had some fine yellowleg shooting, from Sept. 15 up to date. I made a bag of 145 in one day and several bags of from 50 to 90. I bagged, perhaps, 50 golden plover, more than I have shot in ten years before.

MORE ANON.

Essex Association.

A well-attended meeting of the Essex Fish and Game Protective Association was held Oct. 14, in its headquarters at 137 Belleville avenue. Twenty-six new names were added to the roll. The annual election of officers took place and the selections made met with the hearty approval of all present. The officers chosen are: Walter H. Parsons, President; Frederick Felder, Vice-President; Alvin E. Ebie, Treasurer; Joseph Crawford, Secretary; William Waltzinger, Charles Liming and Victor Hess, members of the Board of Governors. Regular meetings will be held hereafter on the third Thursday of each month. A determined effort will be made by the association to have the next Legislature pass a bill prohibiting pound net fishing in New Jersey waters.—Newark Sunday Call, Oct. 18.

Maine Summer Deer Killers.

THE office of the fish and game commission in Augusta is the liveliest place in the building lately. Big hunting stories, illegal killing of deer, moose and partridge and notices of arrests come in almost every day. Word has just been received at the office that warrants have been issued by the Farmington Municipal Court for the arrest of Frederick White, of Brooklyn, N. Y., for hunting and trapping fur animals without a license. This same party was arrested some time ago, for camping and kindling fires on wild land near Eustis, without being accompanied by a guide. A warrant has also been issued for the arrest of Dr. C. B. Parker, also of Brooklyn, for camping and building a fire on wild land without a guide, and for killing deer in close time.—Bangor Daily News, Oct. 13.

Pennsylvania Quail.

YORK, Pa., Oct. 17.—The York Gun Club held a meeting last night and decided to issue an appeal to York county hunters to refrain from slaughtering partridges that are not fully matured. Partridges have been on the increase in York county for the past six years. Birds from Kansas have been extensively introduced and propagated, and if the coveys receive the proper protection the county will become an excellent section for quail shooting.

Nebraska Notes.

The Omaha Gun Club's annual autumn tournament will be held this week—October 13, 14 and 15. It will be live birds and targets, and the prospects are fine for a large attendance.

The fifth annual coursing meet of the Friend, Neb., Coursing Club will be held October 13, 14, 15 and 16, with two grand stakes, the Puppy and All-Age.

CLARKS, Neb., Oct. 12.—Friend Sandy: Was down on the Platte yesterday and there was a big flight of ducks. I bagged twenty-five, twenty-two of which were mallards. Some Canadas are in. The river is in fine shape, water low, and you can drive right out to the blind. We are going to have great shooting from now on till winter. Better run out and get a little of it while this beautiful weather lasts.

SAM RICHMOND.

Game Warden George Carter and Fish Commissioner O'Brien are kept pretty busy these days. They have just secured 10,000 yearling and six-months-old black bass from Langdon, Kansas, in exchange for a lot of gold fish they have had on hand at the State hatcheries. These bass will be deposited the coming week in likely waters throughout the northwestern part of the State. The Government has also just allotted Nebraska 10,000 fingerling rainbow trout from the Government fisheries at Neosho, Mo., and the Nebraska fish car will go down after them November 10. These trout will also be distributed throughout our western and northwestern waters.

Charlie Highsmith, of Omaha, and Messrs. Slusser, Orr and Coots, of Grand Island, returned from a three-days' chicken shoot near Burwell last evening. They killed the limit, each man, every day, shooting but a couple of hours mornings and evenings.

SANDY GRISWOLD.

Personal Notes.

Mr. B. W. Sperry, of Jacksonville, Fla., one of the most enthusiastic and best known sportsmen of his State, is in the city, and has been renewing with his many sportsmen friends here memories of Florida days in their company in the quail fields. Mr. Sperry says that the outlook for game in the winter of 1903-4 is very favorable.

Mr. A. S. Reid, of Victoria, B. C., is reported as at the present time hunting big game in the Rocky Mountains of British Columbia on Sheep Creek near Field. Not far from Mr. Reid, Mr. C. A. Moore, of this city, is also hunting.

Mr. John J. White, Jr., who, with Mrs. White, left New York early in September for the Jackson's Hole country, is expected back shortly before November 1. It is understood that Mr. White intended to visit a sheep country, the precise location of which is not generally known.

Mr. Madison Grant, the Secretary of the New York Zoological Society, has recently returned from a trip into the mountains of British Columbia. The region which he visited is one hitherto untouched by sportsmen, but is apparently only a summer range, and winter set in just as Mr. Grant reached the ground. The trip was undertaken more for exploration than for actual hunting, nevertheless four specimens of the mountain caribou (*Rangifer montanus*) were secured, and will no doubt go to the American Museum of Natural History, toward the increasing of whose collections Mr. Grant has done so much. The precise locality visited on the trip is not given.

Another trophy brought back is the head of a goat (*Oreamnus montanus*) of extraordinary size, since its horns measured 11 inches in length. Such a length for horns of the male goat is, we think, quite unexampled.

Mr. Grant is perhaps the first sportsman who ever captured a specimen of *R. montanus* knowing what it was, and he is to be congratulated on his good fortune.

Sharpshooting Snipe.

FREEPORT, Long Island.—*Editor Forest and Stream:* The Brooklyn Times printed from its Far Rockaway correspondent the other day this report of shooting conditions there: "There are plenty of snipe to be found, and sportsmen with their rifles can be seen daily hunting this bird on the grounds surrounding the Edgemere Hotel and at Rockaway Point."

We shall soon see our German friends with 'coon dogs and air rifles shooting the festive snipe. This is the way the sporting column of the Times is marred.

E. K. L.

Amos Green, a worthy colored man, who conducted a farm in the vicinity of Alachua, decided he wanted to eat some gopher, and accordingly went in search of his game. This was on Friday morning, and when he did not return on the following day, his good wife and family naturally became alarmed; and, with a few neighbors, instituted a search.

After a couple of hours, one of the searching party discovered the man's legs extended from the ground, his body and head being buried. With the shovel, which Green had carried with him, the earth was soon removed, and when he was released from this bondage it was discovered that one hand was still tightly grasping a gopher's leg at the bottom of the hole.

It is supposed that Green attempted to dig his game out of its abode, and when a sufficient quantity of earth had been excavated, he had gone in after the game head first, expecting to capture it and pull it out. The earth, being soft, at once gave way, and the man suffered the terrible experience of being buried alive. It is supposed he had been dead about twenty-four hours.—Florida Citizen.

The Game Laws in Brief.

'is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Camping at Fort Washington.

SEVERAL summers back, Dick Gibson, then of Alexandria, and I started down the river early one morning to camp for a few days at Fort Washington, about eight miles below Washington, D. C. We had been planning this camping trip for some time, and in the meantime had built a sailboat, and this was her first trip. She glided through the water to our entire satisfaction, and with a stiff breeze behind us we were soon at the fort. Anchoring our boat we unloaded her and put up camp. We had everything in order by 12 o'clock, and after dinner we decided to try the fish.

We started out to try our luck with the channel cats, which have been caught off this point weighing eight and ten pounds. There are plenty of other fish, such as white perch, ring perch, rock fish, etc., and by 4 o'clock we had a nice string, but the channel cat was missing. He was not biting to-day. We started back to camp. After supper and a good smoke we turned in and were soon off to the land of dreams.

We were awakened the next morning by the hoarse whistle of a tugboat towing a big schooner to Alexandria. It is a pretty sight to watch the different craft going up and down the river. Along about 7 o'clock in the morning you can see the palace steamer Norfolk coming around the bend in the river. At first she looks like a mere white speck, but as she noiselessly glides through the water, you can presently distinguish her identity. Later in the day the excursion boats begin to come down on their way to River View and Marshall Hall. In the distance we can hear the band playing and see the flags flying. On past us they go, and what a merry crowd it is—all glad to get away from the hot city for just one day.

After dinner we got into the boat and went up to "Hell Hole," a favorite place to fish for white and ring perch. Here the water shoots off from the main river and goes on down to the dyke below New Alexandria, at which place, on Sunday, scores of fishermen from Washington can be seen catching a species of perch which they call "tobacco box." Sometimes you see a man with as many as 150. We caught a good string of white perch at "Hell Hole," and spent part of the afternoon swimming and watching the big four-masters go by. In the distance we could hear the ferry boat blowing, which told us it was 6 o'clock, so we put up sail and started for camp. Soon the blue smoke was curling up through the trees from our camp stove, and it was not long before the odor of frying fish pervaded the atmosphere around us. Dick is a fine cook, and as I am not a good hand at anything in that direction, I always got the fish in shape for the skillet.

We had planned a frog hunt on this trip, and we were told by a gentleman who lives near the fort that right back of us a short distance were plenty of frogs as big as our hats. We made a date with this gentleman to meet him there some night and we'd take a hunt.

The next day we were going down the river to Hennecky House, the exquisite romance of which has been read by so many Virginians. The morning dawned clear with a stiff breeze blowing, although it was rather changeable, which necessitated our making many tacks before we reached our destination. It was great fun riding the swells from the steamers passing along the river. Sometimes, it seemed, we would go nearly out of sight in the hollow of the waves, only to rise again and go down with another one. Right below where we anchored are the great herring grounds of Plum Tree Gut, where each spring thousands and thousands of herring are caught every day. Some of the nets are four and five hundred feet long, and are hauled out by horses and engines. All kinds of fish are caught—anything from perch to sturgeon, and sometimes a shark, following a schooner, attracted by the continual throwing out of refuse, is captured in the nets. Near where we landed was a high plateau, from which it seemed you could see almost into Chesapeake Bay. In the distance were the white, motionless sails of the craft, which grew larger as they drew nearer. It had gotten along to the hour of 12, and after eating our lunch we put up sail and started back up the river for Fort Washington. We had not gone far before we heard the blowing of a steamer behind us, and looking around we discovered that we were right in the course of the excursion boat Samuel J. Pentz, and she was coming along at a good rate, too. We threw our sails around and got out of her way, but somehow or other the swells struck us broadside and nearly swamped us, filling our boat half full of water. We finally got straightened out, and after that hugged the shore a little closer.

We reached camp about 4 o'clock, and were somewhat surprised to find that a party from Washington who had come down the river on a pleasure trip had stopped to see us, and finding no one there had waited until we returned. We made them stay to supper, promising them plenty of fried fish and good coffee. They stayed, and it did us good to see those fellows eat. They had never eaten in this way before, out in the pure fresh air, and they all declared they did not know when they had eaten a meal that had tasted half so good. They came down to see us again before we left, and seemed glad when they had their feet under the old camp table once more.

After our visitors left, we got ready to take the long-talked-of frog hunt. We rigged up in old clothes and shoes with a bicycle lantern apiece. My friend Gibson had never hunted frogs with a lantern and laughed at me when I told him that all you had to do was to walk along and throw the light on the frog and then pick him

up and put him into the bag. The man who had told us about the frogs was waiting for us when we got to the place, and we lighted up our lanterns and started. Dick was the first to see game.

"Oh, Cline, look here; here is a monster of a frog," and following the direction he pointed out I saw one that looked as big as our skillet. For a moment I envied Dick, for I would like to have caught that frog myself.

"Well," I said, "go on and pick him up."

"Oh, get out," he said. "Why, that frog wouldn't let me get within ten feet of him."

"All right," I said, "you go on and try him."

Dick eased on up and felt more encouraged as he found himself getting nearer to the green monster. He kept inching up until he was within two feet of his prey, and still the frog had not moved. Dick was staring him in the face with his lantern all the time and walking on air. He stopped for a moment and measured the distance between him and the frog, and he knew now that by leaning forward he could easily reach the green monster, unless it should jump. His hand slowly approached the frog—and still it was rigidly still. Dick made a grab and landed squarely on the head of the frog and pressed it down into the mud. When he had secured a firm hold on it, he held it up high, its long white legs dangling in the air.

Dick was very enthusiastic now, and went to look for another. In about two hours we caught fifty-four, and then we called the sport off for that night. We were tired when we got back to camp, and needed no rocking to put us to sleep.

Our camping trip was over, and we were to leave the next day for old Alexandria. We fished faithfully the next day up until 12 o'clock in order to have some fish to take to our landlady, and we succeeded in catching a nice bunch. After dinner we broke camp, packed the boat, and at 4 o'clock took off our hats to the old fort and pulled out up the river.

ALF CLINE.

WINCHESTER, Oct. 12.

The Lake Champlain Situation.

DESPITE continued threats of violence against life and property, the ranks of the residents and property holders about Lake Champlain interested in fighting the pulp mill nuisance under the leadership of Mr. Edward Hatch, Jr., of the firm of Lord & Taylor, are determined to bring the issue to a successful end.

Governor McCullough, of Vermont, when seen by a representative of FOREST AND STREAM at his office in New York city, declared that it was his firm intention to do all in his power to stop the further pollution of the waters of the lake by the offending mills, and also to put an end to illegal seining.

"For some time," said he, "I have been endeavoring to get the authorities of the States of Vermont and New York and the Dominion of Canada to unite in taking some concerted action looking to ending the evil, and I have strong hopes that in the near future combined and uniform action by the trio of legislative bodies will bring about the desired result."

"I have many times had the matter of the offending pulp mills brought to my attention. When Prof. Landreth, of the New York State Board of Health, hands in to Governor Odell his report on the subject and it is found that the mill owners are breaking the law against the pollution of streams, I think summary action should be taken."

"If the mill owners show delay in abating the nuisance, it will then behoove residents and property holders to apply to the Supreme Court for an injunction to close the mills. Such strenuous action, I believe, would cause the mill owners to at once adopt some plan of getting rid of their refuse other than by dumping it into the lake as I understand has been done for many years. The grievance of the residents and property holders has my full sympathy and support. To stop pollution of the rivers and lakes and illegal fishing has long been a matter in which I have been vitally interested."

Mr. Hatch when seen yesterday declared that the ridiculous statements made last week by those having the milling interests at heart would surely act as a boomerang in defeating their very purpose. "It was one of the most remarkable instances of pure nerve and gall that I ever heard," said he. "Everyone having but the slightest intimacy and knowledge of the matter knows that the mills in question have for years been defying the law, polluting the waters of the lake, and, besides killing the fish, have converted certain rivers and portions of the lake into veritable sinkholes of noxious slime and filth. Just think of the bare-faced audacity of statements to the effect that the mill refuse in question tends to star and clarify the lake waters, and not only to beautify, enliven and increase the fishes in it, but that they should be paid and well paid by the State for so doing. Also that the waste refuse that they pour into the lake is a fine medicinal tonic for both man and beast. I have some of this newly discovered elixir of life in some jars there. Will you please examine it?" The jars appeared to hold a villainous compound, and the smell was nauseating. "Well," commented Mr. Hatch, "that's the crystal, sparkling, and delicious waste water that the mill people are pumping into the waters of the lake to the extent of several hundred thousands of gallons daily. I suppose that the next thing we will hear is that pipe lines are about to be built to convey these magical waste waters to the various resorts in the Adirondacks so that summer visitors, excursionists and invalids in search of curative waters for all bodily ailments can have ready access to them, and all without cost to anyone, and from purely philanthropic motives. I'm sure if Ponce de Leon were alive now all he would have to do would be to journey to the mill region to discover the long-sought-for 'fountain of youth.' From what they have said, I suppose that they are supplying this pure, scintillating and de-

lightful waste water to the New York aquarium so that the poor fishes there may be benefitted. Such statements as these, coming from persons interested in the mills, are very amusing, but at the same time so ridiculously untrue that no one except an idiot would give them credence. If the contestants on the other side have any hope of winning this fight they must adopt saner tactics, and stop telling Munchausen-like stories that not only have a tendency to amuse but to offend and insult the intelligence of the public.

"Mr. L. S. Drew, whose world-famous breeding farm for Ayrshire cattle is located on Shelburne Bay, tells me that the shore line of his estate is literally covered in the springtime with millions of tiny dead fish. They are poisoned by the breaking up of the ice in the rivers by the spring freshets. This ice, after being impregnated with the mill refuse all winter, is carried out into the waters of the lake, and the young fish, unable to live in the contaminated waters, are killed in myriads. A number of fishermen are now engaged in gathering additional information on this point, all of which will be adduced at the proper time."

"I am advised that the anti-polluters in Burlington are now up in arms on the sewage question there and are determined that an end be put to the further pollution of the lake from this source. They argue that a disposal plant should be built, and doubtless their efforts will be rewarded before long."

Dr. Ricketts, of the firm of Ricketts & Bank, of John street, New York, noted as consulting chemists, stated to the writer that he had heard much of the pollution of the waters of Lake Champlain by pulp mills in that region, and that the firm had been consulted on the subject. However, no investigation had been begun by them as yet. "We have just completed a somewhat similar case," said Dr. Ricketts, "for a fishing club on Lake Hopatcong who complained that the waters were being poisoned and the fish killed in the lake by the impurities discharged into it by a powder mill. We found that about the only way to convince the jury that the owners of the mill were polluting the lake was by a practical experiment made in court. Two jars, one containing water brought from a distant part of the lake, and the other filled with water obtained in the lake nearby the mill, were placed on the court room table. Young fish that were placed in the latter jar died in a few minutes, while those placed in the first mentioned jar continued to

PALACE OF FORESTRY AND FISH AND GAME, ST. LOUIS.

live. The verdict was at once given in favor of the complaining members of the fishing club, and as a result the mill owners adopted other means of getting rid of their chemical waste.

"Many instances could be cited to show how owners of mills and factories have had fortunes thrust upon them in being compelled by the authorities to find methods of getting rid of their refuse other than by dumping it into streams, rivers, lakes, etc."

"Several years ago the sludge acid discharged from the oil refineries situated along the North and East rivers and Staten Island Sound became an intolerable nuisance. The local boards of health, the courts and the Legislature were all appealed to to bring about an abatement of the trouble. The refinery owners fought the issue tooth and nail. Years went on and the boats and piers were covered with sludge and slime that gave out the most sickening odors. Finally a popular uprising resulted in the enactment of a law compelling absolutely a discontinuance of the pollution."

"The refinery owners were given a certain length of time to find other means of disposing of the refuse when it was discovered that the sludge, etc., was in reality a valuable 'by-product,' and now the greatest care is taken to recover it, letting none go to waste."

"I feel sure that if the pulp mill owners on Lake Champlain are driven to the wall by the courts, they will manage to find some other way of getting rid of their chemical waste, and it would not greatly surprise me if in the end they greatly profited thereby."

Palace of Forestry and Fish and Game.

THE Palace of Forestry and Fish and Game was designed by Mr. E. L. Masqueray, Chief Designer, Division of Works. It is 600 feet by 300 feet in area and covers four acres. It will be completed in December at a cost of about \$175,000. The building is located a short distance south of the Administration Building. It has three principal entrances on the north, and three on the south front. The central nave is 85 feet wide and entirely clear of posts. The ends are 85 feet in width, without posts.

Interesting features of this palace are the great aquarium and inclosures which will contain the live fish and game exhibits of many States. In the center of the building is a marine pool, 40 feet in diameter and 5 feet deep.

The forest resources as well as the fish and game of most of the States and many foreign countries will be exhibited in this palace. The exhibit space will be supplemented by many acres of outdoor area for displays of tree-planting, forest management, live game and other features.

Sawdust and Fish.

BY A. P. KNIGHT, M.A., M.D., PROFESSOR OF ANIMAL BIOLOGY, QUEEN'S UNIVERSITY, KINGSTON.

(The following report on the effects of sawdust on fish relates to experiments undertaken by Professor Knight, at the suggestion of Professor Prince, Fish Commissioner for the Dominion of Canada.)

THE investigation was begun at the suggestion of Professor Prince, the fish commissioner for the Dominion of Canada, and has been carried on largely through the encouragement which he has given from season to season.

The question, "Is sawdust injurious to fish life?" has been before the Canadian public for over forty years. The Fishery Act of 1858 for the two Canadas provided that fish ways should be erected upon dams that obstructed the passage of anadromous fish to their spawning grounds in the shallow headwaters of rivers; and it forbade also throwing lime, chemicals, and other poisonous material into such rivers. It did not mention sawdust or mill rubbish, but it provided for the making of regulations by the executive, and in the exercise of this power we find that on May 16, 1860, a by-law was passed making it illegal to throw "slabs, edgins, and mill rubbish into any river or stream which may have been leased or reserved by the Crown for propagation, or where fish ways have been erected."

Immediately after confederation the act was further amended, and a very important proviso was attached to the foregoing clause, viz.: "Provided always that the Minister shall have power to exempt from the operation of this sub-section, wholly, or from any portion of the same, any stream or streams in which he considers that its enforcement is not requisite for the public interests."

Evidently the promoters of this legislation either did not feel sure that sawdust was poisonous, or they thought it just, in the interests of the lumber industry, to exempt from the operations of the act certain large rivers in the maritime provinces, Quebec and Ontario. Exemptions were continued by the Minister from year to year down to 1894, when they ceased by Act of Parliament. Parliament itself, however, extended these exemptions down to 1899.

Most of the Eastern United States have legislated against throwing sawdust into streams containing protected fish; but so far as I have been able to discover, the promoters of the legislation have never been able to prove conclusively the poisonous action of sawdust. At any rate, the scientists of the United States Fish Commission have not been unanimous in their opinions regarding the matter.

On November 29, 1888, there was started in FOREST AND STREAM a very remarkable correspondence, which lasted nearly a year. The general topic was the effect of sawdust upon trout. The writers lived in Canada, the New England States, and some in the West as far as California. Both sides of the question were presented with great vigor. Most of the correspondents were evidently keen sportsmen and close observers of nature, and the only regret one feels in reading through these letters is that some of the men did not test their observations and conclusions by experimenting with sawdust.

In this same year (1889) a very remarkable report on this subject was sent to the Hon. C. H. Tupper, the Minister of Marine and Fisheries, Ottawa, by W. H. Rogers, late Inspector of Fisheries for Nova Scotia. The report did not appear among the State papers, and it was consequently published in Halifax under the title of "The Suppressed Sawdust Report." No one can read this pamphlet without being staggered with the mass of information which is supplied to prove the harmlessness of sawdust, and the marvel is that the Minister did not order a thorough investigation to be made into the whole subject.

Of course, diametrically opposite views were expressed by other fishery officers, in whose judgment, no doubt, the Minister had perfect confidence. For example, Mr. S. Wilmot, the Superintendent of the Dominion Fish Hatcheries, wrote a very vigorous report denouncing the deadly effects of sawdust, and his opinions were certainly entitled to some weight. But there was this marked difference between the reports of the two officers: Mr. Rogers' was bristling with facts and observations based evidently upon first hand knowledge of the subject, whereas Mr. Wilmot's report showed no close acquaintance with it.

Coming to 1899, we find a very important report from the Dominion Fish Commissioner, Professor Prince, and one from the Deputy Commissioner for the Province of Ontario, Mr. Bastedo. Both reports command attention from the fact that they take opposite sides upon the sawdust question. Professor Prince says: "So far as our present knowledge goes, sawdust pollution, if it does not affect the upper waters, the shallow spawning and hatching grounds, appears to do little harm to the adult fish in their passage up from the sea." * * * "There is no case on record of salmon, or shad, or any other healthy adult fish being found choked with sawdust or in any way fatally injured by the floating particles."

Contrast with this Mr. Bastedo's opinion, as published in his report for the same year: "There can be nothing more destructive of fish life than the depositing of sawdust in the rivers and lakes. It is said to absolutely kill all vegetation, and it is well known that in waters where there is no vegetation fish life is noticeably absent. Minute crustacea of various kinds feed upon the juice of the plants which are to be found at the bottom. These afford food for the smaller fish, and again these furnish food for others of larger size."

In 1900 at the suggestion of Professor Prince, I undertook some experiments at St. Andrews, N. B., for the purpose of ascertaining whether or not sawdust was injurious to fish life.

The results of these experiments were published in the report of the Minister of Marine and Fisheries, Ottawa, in 1901, and went to show that brook trout were not injured by living for two weeks in a water tank largely filled with sawdust, so long as a copious supply of water was allowed to run into and out of the tank. These results were abundantly corroborated

this summer (1902) in a series of experiments carried on for several weeks in the biological laboratory of Queen's University, Kingston. Perch, rock bass and black bass fry were all used. In fact, the tests this season were, if anything, more exacting than they were in 1900. The volume of pine and of cedar sawdust used was 20 per cent. of the whole volume of the tank, and both adult fish and black bass fry (these latter only about six weeks old and an inch long) were kept for four or five days in the mixture, without any apparent injury.

When, however, sawdust was allowed to lie in still water, or in very slowly running water, entirely different results were obtained. Then, the most disastrous effects followed the immersion of different animals in the poisonous mixture. Not merely did adult fish die in it, but fish eggs, fry, aquatic worms, small arthropods, animalcules and water plants. Nor was the cause of death due to suffocation from lack of oxygen, because when air was made to bubble rapidly through the solution the final results were the same, the only difference being that death was somewhat delayed. No one could paint too vividly the deadly effects of strong solutions of pine or cedar sawdust when soaked in standing water. Adult fish died in two or three minutes; fish eggs in a few hours; fry and minnows in from ten to fifteen minutes; aquatic worms and insects, eight to twenty-four hours; aquatic plants, a few days. Every living thing died in it, and if one were to judge of its effects by laboratory experiments alone, then the prohibitory legislation needs no better defense.

The following conclusions are based upon the results of many similar experiments: From 50 per cent. to 80 per cent. of white pine sawdust sinks in standing water, in from two to three minutes. The variations in quantity and time depend upon (1) the size of the particles, (2) upon the manner in which they are made, (3) upon whether the water is perfectly still or agitated, and (4) upon whether the particles are dry or moist.

Large particles sink much more slowly than small ones, because the latter are more easily penetrated through and through by the water.

Dust made with a hand-saw sinks more slowly than sawdust made with a large mill saw. The difference seems to be due to the difference in the force with which each is made. A large upright or circular lumber saw strikes the log with great force, squeezes out the imprisoned air from the wood fibres, renders them denser, and as a consequence they sink more quickly than particles of a similar or smaller kind which have been made by a hand-saw.

When water is slightly agitated, sawdust thrown upon it sinks more quickly than when the water is perfectly still. Consequently, in the swells of a steamer, in the waves made by wind, and in the ripple of a slight rapids, all the sawdust excepting the largest particles would sink to the bottom in a few minutes.

If thrown into a rapidly flowing stream, sawdust is carried downwards until it reaches comparatively still water, and then the finer particles sink; the coarser may be carried for miles and miles down a river and out into the bays of a lake or sea.

In laboratory experiments the coarser particles would float for days, because the water is unable to penetrate the fibre and displace the imprisoned air, which gives to wood its buoyancy. Wood fibre is, of course, heavier than water, and therefore sinks; and pine logs would sink much more quickly than they do only that the water cannot penetrate their interstices and drive out the air. Yet they do sink in considerable numbers, as every lumberman knows.

Hardwood logs cannot be floated to market at all, because the water of the cell-sap permeates them, rendering them heavier than water, and they sink. A very simple experiment illustrates how pine logs sink after being in the water some time. Throw a piece of black-board crayon into a dish of water. At first it floats, but soon bubbles of air escape from the chalk, and in a few moments it sinks to the bottom. So is it with sawdust and logs.

The first experiments of the season were performed for the purpose of determining the effects of sawdust upon fish eggs. The St. Andrew's experiment had shown that adult trout were not injured by sawdust in rapidly running water; but two other points remained to be determined: (1) Whether sawdust killed fish eggs, and (2) whether it destroyed the food of young or full grown fish.

Perch eggs were collected along the shallows of Collins Bay, just west of Kingston, and brought to the laboratory on May 12. They were placed in a clean aquarium with a stream of tap water (from Lake Ontario) running into and out of the vessel. On the same day a bag made of bleached cheese cloth, and filled with a peck of white pine sawdust was placed in an aquarium, 40½ inches by 15 inches, by 16½ inches. It was weighted with stones to keep it on the bottom. Water entered the aquarium very slowly, so that the conditions of the experiment approximated somewhat to those in the pools of a sluggish stream.

Next morning it was noted that as a result of the bag of sawdust being in the aquarium all night, the water had dissolved out a sufficient amount of material from the sawdust to turn the bottom layer of water a yellowish brown color. This layer measured 1¾ inches in a total depth of 16½ inches. Above the yellowish brown layer, and separated from it by a well-defined surface, the water was as clear as that of Lake Ontario. Only about four-fifths of the bottom of the aquarium was covered by the bag; its upper surface stood about half an inch above the brownish liquid. Four batches of eggs were placed in the aquarium at 10 A. M. of the 13th of May, viz.: two batches on the very bottom of the aquarium in the brownish water, and two on the surface of the bag of sawdust, well within the clear water.

Next morning at 9:00 A. M. every egg in the yellowish brown water was dead; and every egg in the clear water was alive.

Assuming that the brownish water was a saturated solution of material extracted from sawdust, two other solutions were made from it—one of 25 per cent., and one of 50 per cent. strength, in tap water. Fresh batches

of eggs were placed in each of them. In twenty-four hours the eggs in the 25 per cent. solution were all alive; half of those in the 50 per cent. solution were dead. In twenty-four hours more some of the fry had hatched out, but eggs and fry in both solutions were all dead.

In order to ascertain whether the death of both larvæ and fry was not due to lack of oxygen, rather than to poisonous extracts dissolved from the wood, air was made to bubble rapidly through some of the brown water. This experiment was begun at 12:30 P. M., and 800 c.c. of air per minute were passed through 230 c.c. of the discolored water. At 5:30 P. M. of the same day, a batch of 60 eggs was placed in this aerated water, and air was passed continuously through it all night at the rate of 400 c.c. per minute. Next morning at 10 A. M. every egg in the batch was dead. The conclusion, therefore, is quite clear. The eggs were killed, not by lack of oxygen in the water, but by the poison contained in the water and evidently dissolved out of the sawdust.

[TO BE CONCLUDED.]

Notes from Cincinnati and Vicinity.

THE Pelee Club, composed of prominent business and professional men of Cincinnati, namely, Joseph S. Peebles, Wm. A. Webb, Frank C. Tullidge, Hon. T. B. Paxton, T. W. Paxton, Col. Rennick, Judge Hollister, Albert H. Mitchell, Charles Lewis, Frank Shaffer, W. L. Kayser, Lee Early, Jas. A. Collins, R. K. Le Blond, Capt. Laidley, and Jos. Reeves, returned from their summer outing at Pelee Island, Lake Erie, on October 13. The season's sport was marred by bad weather which kept the anglers in the house a good deal of the time. The prize black bass of the season was caught by T. B. Paxton and weighed 4 pounds 9½ ounces. Charles was a close second with a bass of 4 pounds 6½ ounces weight. Several double and triple catches were made, and the sport was excellent during the good weather. Although the members did not have as good sport as last season, for the reason given, they are not discouraged, but look forward to next season with pleasurable anticipations.

The members of the Columbus (Ohio) Fishing Club were entertained at their thirteenth annual dinner on October 13 by Dr. Thoman, of the Park Hotel. Those present were: M. A. Joyce, president; Calvin Sohl, secretary; James Atkinson, superintendent of club grounds; E. A. Coe, J. G. Dun, W. F. Huffman, B. W. Payne, and S. W. Lyons. The club's grounds are one mile north of Fishinger's bridge, and are said to be one of the best of the fishing preserves in northern Ohio.

Anglers at Louisville, Ky., say that the salmon fishing along the gravel bar just south of the city is good, and some good strings have been taken. A fall in temperature and continued low water in the river will improve the sport materially.

BONASA.

Pennsylvania Fish at the World's Fair.

ST. LOUIS.—Pennsylvania will make an extensive exhibit of fish at the World's Fair. The State Commission has appropriated \$10,000 for the display. W. B. Meehan, State Fish Commissioner, will install thirty-five aquaria in the Forestry, Fish and Game Palace. This is as many as the United States Fish Commission will have in its exhibit in the Government Fisheries Building. The exhibit will include mounted specimens of mammals, birds, and reptiles that prey upon fish life, paintings in colors of the principal pool and game fish of the State, literature upon the subject of fish protection and culture, a miniature waterfall and trout stream, and a hatchery in full operation.

Brunswick Fur Club Trials.

The Brunswick Fur Club trials, the great annual events of the foxhound devotees of the Northeast, took place on the week commencing Oct. 12, at Barre, Mass.

The gathering of 1903 was great, both as to numbers and the eminence of the visitors. The Derby was the first stake. The first day's competition was not decisive enough to determine the winners. The weather was rainy and unfavorable. A start was made at 7:30. Those who, mounted, followed the hunt were

Mr. and Mrs. Thomas W. Hitchcock, Dr. A. C. Heffenger, Miss Heffenger, Harry W. Smith, C. Smith, E. H. Walker and J. E. Bentley. There was a large attendance, among whom were President O. F. Joslin, of Oxford; N. I. Bowditch, of Framingham; John Duguid, of Framingham; Dr. R. F. Perkins, of Framingham; Thomas Brown, of Framingham; Mr. and Mrs. L. W. Campbell, Woonsocket, R. I.; J. H. Baird, of North Orange; Herbert Maynard, of Dedham; E. H. Walker, of Hammack, Ky.; A. B. F. Kinney, of Worcester; B. L. Brooks, South Vernon, Vt.; C. E. Perkins, Burlington, Ia.; Dr. and Mrs. A. C. Heffenger, Charles Heffenger and Miss Heffenger, of Portsmouth, N. H.; Lemuel Pope, Jr., Portsmouth, N. H.; George A. O'Neil, Yonkers, N. Y.; Bradford S. Turpin, Roxbury; O. B. Howe, Hudson, and V. S. Spaulding, Monroe City, Mo.; Thomas G. Breemer, Brookline; S. P. Breemer, Boston; Henry Hill, Worcester; H. B. Smith, Norwich, Conn.; Philip W. Moen, Worcester; Harry W. Smith, Worcester; Mrs. George Crompton, Worcester; Miss H. Barton, Worcester; Mr. and Mrs. Thomas W. Hitchcock, Westbury, L. I.; Chetwood Smith, Worcester; C. J. Prouty, Scituate, Mass.; John C. Bentley, Sandy Spring, Md.; Capt. S. B. Parker, Boston; Henry G. Vaughan, Boston; F. B. Whidden, Boston; George S. Whittemore, Leicester; Fred Bucklin, Worcester; A. B. McGregor, Medfield; W. Hair, Worcester; C. H. Howe, Worcester; L. F. Herrick, Worcester; F. S. Peer, Ithaca, N. Y.; W. H. Turner, Newburg, N. Y.; J. Bradley Scott, Newburg, N. Y.; A. Wheeler, G. Henry T. Mitchell, C. Lovell, P. Cummings, Worcester; Henry L. Morse, Boston.

The Derby competition was resumed early, 6 o'clock, on Tuesday, Oct. 13. Three foxes were started, the first by Mr. Harry W. Smith's Sing and Song, the second by Mr. Thomas W. Hitchcock, Jr.'s, Maid, E. Walker's Ben and Harry W. Smith's Sing and Song. The third chase was largely in the open and was excitingly spectacular. After dinner the judges announced the winners as follows: First, Thomas W. Hitchcock, Jr.'s Maid; second, Harry W. Smith's Sing and Song; third, W. S. Walker's Ben; fourth, E. H. Walker's Flirt. The winner of the Derby will hold the R. D. Perry Cup for one year, and wins outright one of the club cups.

The judges were Charles H. Howe, of Worcester; Bradford S. Turpin, of Roxbury; Dr. Lemuel Pope, of Portsmouth, N. H.; George B. Appleby, of Oxford; E. L. Brooks, of Vernon, Vt.; F. B. Whidden, of Boston, and C. J. Prouty, of Scituate. The entries were: Mrs. L. W. Campbell's Ten Broeck and Beauty; V. G. Spaulding's Mark Hanna; Thomas W. Hitchcock, Jr.'s, Maid; S. D. Parker's Wayward; F. S. Stark's Hazel Belle; W. S. Walker's Ben; E. H. Walker's Flirt; A. B. F. Kinney's Cricket; H. W. Smith's Sing and Song; A. O. Allen's Jess, and W. H. Turner's Jack.

The entries in the All-Age Stake was the record breaker of the club. There were upward of 70 entries. Of these about 62 started. Competition in this stake commenced on Oct. 14. The start was made at 6 o'clock A. M. The weather was clear and calm. Foxes were found in ample numbers. The trial was unfinished on Wednesday, therefore was carried over to the next day. The judges will gradually sift out the dogs which have no chance to win. The first fox was started soon after the hounds were slipped. He was started near the Hancock Swamp, south of the Petersham road. A pack of 25 hounds carried him swiftly southeast, driving him into the open for a clear run of three miles, to Dennyville, on the outskirts of Barre Plains. Messrs. A. B. McGregor, Harry W. Smith and Dr. A. C. Heffenger followed dashing. The pack was split, and a part of it had in the meantime started another fox, which they hunted for about two hours in the Moose Brook district. Another section of the pack carried off the fox to the Hardwick Hills. In a fourth hunt, the fox was driven to earth. Much of the hunt was in the open. Some discussion on the unsettled question, whether hounds can run a northern red fox to the death was revived on finding a dead fox where the hounds had had a noisy skirmish earlier. The fox, on examination, was found to be a cripple from a gun shot wound in a hind leg. The consensus of opinion was that the distinguished Southern visitors had changed their minds, both in regard to the Northern hound, which they heretofore considered slower than the Southern hound, and the Northern red fox, which they considered as being overrated. The Northern red fox was conceded to be the speediest and wariest of the fox family, beyond the compass of any pack in his native hills.

The All-Age Stake was finished on Friday.

Early in the morning 38 hounds were started for the final chases. The weather was unfavorable for good work, being foggy and the ground wet. The judges held a long conference, about seven hours, before determining the winners.

The club cup was won by Ailsie, owned by E. H. Walker, of Hammack, Ky.

The Pope Memorial Cup for first in trailing speed and driving, was won by Bandit, owned by Dr. A. C. Heffenger, of Portsmouth, N. H.

The first hunting prize was won by Mont, owned by E. H. Walker, of Hammack, Ky.; second was won by Logan, owned by P. W. Moen, of Worcester; third was won by Scott, owned by J. Bradley Scott, of Newburgh, N. Y.

First trailing prize was won by Bandit, owned by Dr. A. C. Heffenger, of Portsmouth, N. H.; second was won by Calif, owned by H. C. Alley, of Burlington; third was won by Breeze, owned by Mrs. L. W. Campbell, of Woonsocket, R. I.

First speed and driving prize was won by Ailsie; second was won by Rye, owned by J. Bradley Scott, of Newburgh, N. Y.; third, was won by Bandit.

First endurance prize was won by Victor, owned by J. C. Bentley, of Sandy Springs, Md.; second was won by Arp, owned by E. H. Walker, of Hammack, Ky.; third was won by Calif.

Special, a hunting horn, was awarded to Logan. Ailsie also was given the club cup, and will hold for one year the Hitchcock cup and the Woodstock Kennel cup, offered by Randolph Crompton, of Worcester. In the four classes the first prize winners each receive

a cup, and the winners of second and third get diplomas.

The competitive qualities are defined as follows:

By hunting shall be understood the general ranging and starting qualities of a hound.

Trailing shall be considered the manner in which a hound follows a trail before a fox is jumped.

Speed and driving shall be considered rapidity of movement while actually carrying the scent, and therefore the hound doing the greater part of the leading and known to be carrying either the ground or body scent, is the speediest.

By endurance is meant the capacity of a hound for continuous maximum work during a number of successive days' trial.

By tonguing is meant the use a hound makes of his voice after he is let loose for the day's trials.

The foxhound having the highest general average shall be adjudged the winner of the All-Age Stake, and in computing the highest general average, the first prize in any class of the All-Age Stake shall count 50, the second 30 and the third prize 20.

The Law About Dogs.

From the New York Times.

By the common law, as well as by the law of most, if not all, the States, dogs are so far recognized as property that an action will lie for their conversion or injury, although, in the absence of a statute, they are not regarded as a subject of larceny. The very fact that they are without the protection of the criminal laws shows that property in dogs is of an imperfect or qualified nature, and they stand, as it were, between animals *feræ naturæ*, in which, until killed or subdued, there is no property, as in domestic animals, where the right of property is perfect and complete.

They are not considered as being upon the same plane as horses, cattle, sheep and other domestic animals, but rather in the category of cats, monkeys, parrots, singing birds and similar animals kept for pleasure, curiosity, or caprice. They have no intrinsic value, by which we understand a value common to all dogs as such, and independent of the particular breed or individual.

Unlike other domestic animals, they are useful neither as beasts of burden nor draught except to a limited extent. They are peculiar in the fact that they differ among themselves more widely than other classes of animals, and can hardly be said to have a characteristic common to the entire race.

While the higher breeds rank among the noblest representatives of the animal kingdom, and are justly esteemed for their intelligence, sagacity, fidelity, watchfulness, affection, and, above all, for their natural companionship with man, others are affected with such serious infirmities of temper as to be little better than a public nuisance. All are more or less subject to attacks of hydrophobic madness.

A suit is practically impossible by statute to distinguish between the different breeds or between the valuable and the worthless. The legislation which has been enacted on the subject, though nominally including the whole canine race, is really directed against the latter class, and is based upon the theory that the owner of a really valuable dog will find sufficient interest in him to comply with any reasonable regulation designed to distinguish him from the common herd. Acting upon the principle that there is but a qualified property in them, and while private interests require that the valuable ones shall be protected, public interest demands that the worthless shall be exterminated; they have from time immemorial been considered as holding their lives at the will of the Legislature and properly falling within the police power of the several States.

Laws for the protection of domestic animals are regarded as having but a limited application to dogs and cats, and, regardless of statute, a ferocious dog is looked upon as having no right to his life which man is bound to respect. In the case of *ex parte Cooper*, 3, Texas Appellate Division, 489, it was held that dogs were not property within the tax laws of the Constitution, and that a tax upon dogs was a police regulation, and a legitimate exercise of the police power. The point was made that dogs, being property, should under the Constitution, be taxed ad valorem as other property was. But it was held that the law was not a tax law in its regular sense, but a police regulation. It is true that under the Fourteenth Amendment no State can deprive a person of his life, liberty, or property without due process of law, but in determining what is due process of law we are bound to consider the nature of the property, the necessity for sacrifice, and the extent to which it has heretofore been regarded as within the police power. So far as it is dangerous to the safety or health of the community, however, due process of law may authorize a summary destruction.

Although dogs ordinarily retain their hereditary wolfish instinct, which occasionally breaks forth in the destruction of sheep and other helpless animals, others too small to attack these animals, are simply vicious, noisy, and pestilent. As their depredations are often committed at night, it is usually impossible to identify the dog, or to fix the liability upon the owner, who, moreover, is likely to be pecuniarily irresponsible. In short, the damages are usually such as are beyond the reach of judicial process, and legislation of a drastic nature is necessary to protect persons and property from destruction and annoyance. Such legislation is clearly within the police power of the State.

It is purely within the discretion of the Legislature to say how far dogs shall be recognized as property, and under what conditions they shall be permitted to roam the streets.

LOUIS A. CUVILLIER.

Virginia Field Trials.

RICHMOND, Va., Oct. 13.—*Editor Forest and Stream:* I am having a good many letters from sportsmen in various parts of the country, especially Virginia, asking for entry blanks for our forthcoming Virginia field trials

the week of November 30. Our by-laws require that entries close not later than twenty days previous to holding the trials. I am having the blanks printed now and hope to mail them very shortly. The Virginia field trial will hold an open free for all stake this year, and we hope to have a nice entry of outside dogs.

The judges selected Mr. S. H. Humphrey, Indianapolis, Ind., prominently known as the genial and hustling secretary of the Independent Field Trial Club. We will also have the pleasure of the services of Mr. Chas. W. Tway, of Irwin, Ohio, also known to every man connected with the field trial business. We have also secured the services of Mr. Harry Colquitt, of Richmond, Va. Mr. Colquitt is an old dog man, although not an old man himself. He has attended many trials, and formerly owned Count Gladstone IV. His interest in field trials is unabated, and he now owns some very fine setter dogs and continues to breed the pure Llewellyn.

The Mecklenburg Hotel, where we were so grandly entertained last year, will again be headquarters. Birds are very plentiful on our preserves and are being watched very carefully. Everything points to a bigger and better meet than our most successful one of last year.

CHAS. B. COOKE, Secretary.

National Foxhunters' Association.

LEXINGTON, Ky., Oct. 14.—Please announce that the directors of the National Foxhunters' Association have decided upon New Haven, Ky., as the place to hold the next annual meet, commencing Nov. 30 with the Derby. New Haven is within ten miles of Bardstown, the place of the most successful meet the Association ever held.

Foxes are abundant; in fact, too plentiful.

Good accommodations and good mounts can be had.

The trials are open to all, and foxhunters the world over are invited and urged to attend.

ROGER D. WILLIAMS,
Honorary Sec.-Treas.

Points and Flushes.

JUDGE JAMES M. THOMPSON, Circuit Judge of the Fourth Circuit of Louisiana, died at his home in Covington, Ky., recently, at the age of 61 years. He was an enthusiastic and accomplished sportsman, having a national fame in canine matters as they concern field trials, he having acted as judge a number of times in the 80's, notably in the trials of the New Orleans Gun Club, Southern States Field Trial Club, and Alexandria Rod and Gun Club. He served as a lieutenant in the war between the States, was a Representative in 1870, a Senator in 1872, and was a delegate to the Constitutional Convention in 1879. In 1892 he was elected a member of the Court of Appeals. Personally he was of a quiet, gentle disposition. He had a multitude of friends who were held by their esteem of his sterling worth.

Mr. E. A. Watson, of Nimrod Hall, Va., was a visitor in New York last week, tarrying for a brief period before his departure for England on the 16th inst. He has had bad luck with his kennel in the past year, but he pluckily purposes to replenish his kennel stock while abroad.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of *FOREST AND STREAM* offer prizes for the best stories of cruises submitted to be published in *FOREST AND STREAM*. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.
Second prize, \$50.00.
Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the *Forest and Stream* Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

New Haven is to have another yacht club, and the new organization will be known as the New Haven Sailing Association. Among those interested in the new club are General Phelps Montgomery, Henry F. Parmelee, Myron R. Durham, Edward J. Savage, Clifford E. Smith, James B. Smith, and Vice-Com. Ennis N. Searles, of the New Haven Y. C.

Summary of Lake Michigan Racing, 1903.

THE season of 1903 has undoubtedly been the best of any on Lake Michigan, there being more big events given and keener racing than ever before.

One of the greatest drawbacks has been the scarcity of good harbors, but this has been made up by the fact that better sailors have been developed, through having to stay out when a storm came up, instead of having a handy harbor to run into, and thus escape having to learn by rough experience.

Another great drawback has been the great diversity of types of yachts, thus making it absolutely necessary to peculiarly divide them, and to give time allowance, therefore making races uninteresting as a general proposition for the spectator, he usually seeing a yacht finish and cheered as a victor, and then read in the paper next morning that some yacht he had not even noticed won on time allowance.

In the general racing, yachts have been classified as follows:

All yachts shall be classified by racing lengths. Yachts having 25 per cent. of their over all length in overhang, at least one-third of it forward shall class by themselves and be designated by the letter "A"; all other yachts shall class by themselves and be designated by the letter "B". "B" classification shall only apply to yachts built prior to 1900.

Yachts shall classify by measurement as follows:

Schooners and Yawls—Class 1, over 37ft. R.L.
Schooners and Yawls—Class 2, 37ft. R.L. and under.
Sloops, cutters and cats classify as follows:
Class 1A, Class 1B—Over 45ft. R.L.

LITTLE SHAMROCK.

Class 2A, Class 2B—Over 30ft. R.L. to and including 45ft. R.L.

Class 3A, Class 3B—Over 25ft. R.L. to and including 30ft. R.L.

Class 4A, Class 4B—25ft. R.L. and under.

Special Classes—21ft. knockabout; 21ft. cabin class.

Schooners race at 85 per cent. and yawls at 93 per cent. of their measurement in mixed races.

The formula

$$\frac{L.W.L. + \sqrt{S.A.}}{2} = R.L.$$

has been used together with the above classifications with extremely gratifying results the past two years, the yachts on these waters seeming to be very well matched under them as a general proposition, so that first one wins and then another in a majority of the classes, which keeps up the interest. This will, however, not be the condition many years, as all new yachts building are for the special classes, and the racing proper is being held by the special classes nearly exclusively; general rules, however, will be necessary for many years on account of the many annual long distance events.

The greatest amount and highest grade racing of the past season has been in the 21ft. cabin class; in fact, this class has attracted more attention on the Great Lakes than any other.

Originally the most bitter feeling existed between the advocates of the knockabouts and the advocates of the cabin class, and the rivalry between the owners in the two classes was most intense; however, this has passed and the cabin class advocates have won out; their type of yacht won a popularity heretofore unknown on the Great Lakes, and it has done this strictly on its merits, the rules compelling the designing and building of the best type of yachts for these waters of any yet discovered, they being particularly roomy, strong, able and seaworthy, and therefore extremely popular for cruising, and at the same time possessing speed unattained by any other class of yachts ever seen here, a factor that must not be overlooked by the rule builders, as owners of to-day do not care to invest in slow-going yachts on the theory that they will last forever, all seeming to prefer to have one with good speed that is strong and safe, than one possessing everlasting life.

EVENTS OF THE YEAR.

June 13.—Columbia Y. C. twelfth annual Michigan City race.
July 4.—Columbia Y. C. annual open regatta and race for Thos.

H. Webb 18 to 30ft. time allowance cup, and Pfister cup race under auspices of Chicago Y. C., in the forenoon.
 July 4.—Columbia Y. C. Special Hyman-Berg cup race for 21ft. cabin class.
 Aug. 1.—Columbia and Milwaukee yacht clubs' open race, Chicago to Milwaukee.
 Aug. 7 and 8.—Lake Michigan Y. A. annual meet at Milwaukee.
 Aug. 9.—Milwaukee to South Haven.
 Aug. 11 and 12.—Races at South Haven.
 Aug. 14 and 15.—Annual regatta of Macatawa Bay Y. C.
 Aug. 27 to Sept. 1.—Columbia Y. C. second annual series of 21ft. cabin class for the Sir Thomas J. Lipton competitive cup.
 Sept. 12.—Columbia Y. C. twelfth annual fall regatta, for the Tom Murray time prize cup.
 Sept. 17.—Vencedor-Vanenna match for championship of the Great Lakes, under auspices of the Chicago Y. C.
 Sept. 19.—Second race of the foregoing series.
 Sept. 29 and 30.—Three final races of series of ten for Thos. H. Webb cup, for championship of 21ft. cabin class.

MICHIGAN CITY RACE.

On June 13 the Columbia Y. C. held the real opening of the local yachting season on Lake Michigan with its twelfth annual Michigan City cruising race for cabin yachts, a 38-mile course, under the most favorable weather conditions since the race was inaugurated, it being bright and warm with a brisk fair wind at start and finish with a slight lull about the middle of the lake. Twenty-six cabin sail yachts made the run, Vencedor making the best time, 4h. 56m. The winners were:

Vencedor—Class 1A and time prize for A classes.
 Iroquois—Class 2A.
 Columbia—Class 3A.
 Saint—Class 4A.
 Hoosier—21ft. Cabin Class.
 Alice—Class 1 schooners and yawls and time prize for B classes.
 Wizard—Class 2B.
 Vixen—Class 3B.
 Zamona—Class 4B.

Some five hundred members of the club and their friends followed the race on the big passenger steamer Soo City, which the club chartered for the purpose. The yachtsmen and their friends made merry in the evening at a ball given in their honor by the citizens of Michigan City, at which the prizes were presented, and those present unanimously pronounced the opening event of the season a grand success.

The next events of importance were the Pfister cup race of the Chicago Y. C. and the Thos. H. Webb cups and general open regatta of the Columbia Y. C. Independence Day forenoon. The day opened up bright with a good whole sail S. W. wind, and very warm and pleasant. The Pfister cup was offered by Mr. Charles Pfister, of Milwaukee as a 21ft. knockabout trophy to be contested for annually, and it becomes the property of the yacht that wins it three times. Colleen, the Chicago Y. C.'s sole representative in the class, had already won two legs on it, and it was a case of do or die on the part of the Milwaukee Y. C.'s representatives, and they therefore had every yacht of the class in its fleet on hand to

HOOSIER.

try and wrest the trophy from the Chicago Y. C. In this they were successful, as one of its four representatives, the new yacht Badger II., handily won by a margin of 2m. 10s., and the Milwaukeeans went home with their trophy in a particularly happy frame of mind. The afternoon event planned by the Chicago Y. C. was declared off on account of unfavorable weather, a rain squall having arrived.

The Columbia Y. C. started over forty cabin sail yachts in its open race, and as the weather on the first two legs of the course was absolutely perfect, and everyone of the fleet carried balloon jibs the first leg and spinnakers as well on the second leg, no prettier sight could greet one's eye. At the end of the second leg the spectacular features of the day began, and excitement on the guest boat ran high as the wind suddenly freshened to 35 miles an hour, and the leg home being a beat to windward, only twenty-two of the starters crossed the finish line, the balance quitting to run for the harbor if behind or breaking down; one capsized and another missed the harbor and ran to Waukegan, the nearest harbor north. The winners were:

Vanenna—Class 1A.
 Columbia—Class 3A.
 Vision—Class 4A.
 Sprite—21ft. Cabin Class.
 Alice—Schooners and Yawls.
 Beatrice—Class 2B.
 Kathleen—Class 3B.
 Halcyon—Class 4B.

Sprite won a leg on the Thos. H. Webb cup for cabin

VISION.

yachts of 18ft. to 30ft. L.W.L. on time allowance. Nymph won in 1901, and LaRita in 1902. As the cup must be won by a yacht three years in succession, and a different yacht has won every year, it begins to look like a perpetual trophy and the only interest now is to settle what club will hold the trophy from year to year. The Columbia Y. C. won the first two years and the Chicago Y. C. now holds it until next year, this being the only trophy of prominence for a Columbia Y. C. representative competed and lost the past season.

The Columbia Y. C. afternoon schedule called for a race of the 21ft. knockabouts and 21ft. cabin class, the knockabouts declined the issue on account of the rain and squalls, but the cabin class were ready at gun-fire, and LaRita won the Hyman-Berg cup. The forenoon and afternoon races of the 21ft. cabin class counted as the first and second of the series of ten for the cup offered by Mr. Thos. H. Webb for the championship of that class this season. A percentage table is used in this series.

It might be well to note that Vencedor lost to Vanenna in the forenoon race on a breakdown, and that the accident occurred only a short distance from the finish, and that she was well in the lead at the time, and that this is the only time a yacht of her class defeated her during the season.

The next big event was the combined open race from Chicago to Milwaukee, a distance of 85 miles. This race was started in a stiff E. by N. wind with a big sea, which gradually increased to a gale and hauled to the S. E., the course being about due N., making a close reach at the start and a broad reach the last 20 miles. The start was made at 2:30 P. M. Saturday, August 1, and the Vencedor finished in a smother of foam at 10:18 P. M., having broken all records for sail yachts between the two ports, her elapsed time being 7h. 48m., an average of 11 miles per hour, and this after breaking down just after the start, so that they were only able to carry lower canvas all the way. However, this great record was of no avail, as the little 21ft. cabin class yacht Hoosier hung on like grim death, and won on time allowance over Vencedor by 17m., and Illinois, the old Canada cup trial yacht, also nosed out Vencedor on time allowance. The winners in this event were:

Vencedor—Class 1A.
 Illinois—Class 2A and second time prize for A Classes.
 Columbia—Class 3A.
 Hoosier—21ft. Cabin Class and first time prize for A Classes.
 Zephyrus—Class 2B and first time prize for B Classes.
 Wizard—Second time prize for B Classes.
 Sixteen cabin yachts competed.

The Lake Michigan Y. A.'s races were held at Milwaukee under the auspices of the Milwaukee Y. C., and that organization deserves great credit for the excellent manner the races were conducted. The race on August 7 was sailed in a light S. W. wind. The winners were:

Vencedor—Class 1A, Columbia Y. C.
 Milwaukee—Class 2A, Milwaukee Y. C.
 Pats—Class 3A, Columbia Y. C.
 Blackbird—Class 4A, Milwaukee Y. C.
 LaRita—21ft. Cabin Class, Columbia Y. C.
 Badger II.—21ft. Knockabout Class, Milwaukee Y. C.
 Dolphin—Class 2B, Chicago Y. C.
 Vixen—Class 3B, Columbia Y. C.
 The winners of the forenoon races of August 8 were:
 Vencedor—Class 1A, Columbia Y. C.
 Illinois—Class 2A, Milwaukee Y. C.
 Pats—Class 3A, Columbia Y. C.
 Phantom—Class 4A, Milwaukee Y. C.
 Pilot—21ft. Cabin Class, Milwaukee Y. C.
 Badger II.—21ft. Knockabout Class, Milwaukee Y. C.
 Dolphin—Class 2B, Chicago Y. C.

This gave the championship to Vencedor, Pats, Badger II., and Dolphin, and left Milwaukee and Illinois tied in Class 2A, Phantom and Blackbird in 4A, and LaRita and Pilot in the 21ft. Cabin Class, and the ties in the 2A and 21ft. Cabin Classes were sailed off that afternoon to settle the championship of these classes. Milwaukee won from Illinois on a break down, and LaRita won from Pilot, after a hair-raising struggle from start to finish, by 7s. The first two races of the

21ft. Cabin Class counted as the third and fourth of the series of ten for the Thos. H. Webb cup.

The races were not as well attended as they should have been, especially the smaller classes, but there is no logical excuse for Siren and Vanenna marring the contest in Class 1A by refusing to start and thus practically giving Vencedor a walkover, as the big cruiser Neva was all that was left to compete with her.

MILWAUKEE TO SOUTH HAVEN.

Promptly at 7 P. M. August 9 the fleet started on a 93-mile race from Milwaukee to South Haven for five time prizes. The wind was dead ahead and varied a whole sail to a close reef breeze during the night, with squalls and rain and heavy head sea all the time. The winners were:

Vencedor first, \$100.
 LaRita second, \$50.
 Sallie third, \$30.
 America fourth, \$20.
 Widsith fifth, \$10.

RACES AT SOUTH HAVEN

August 11 in a gale the yachts divided into three classes

LA RITA.

started to sail a course to windward and return, but before they had gone a mile to windward the wind lightened so that full sail was necessary. LaRita won all the honors in this race, defeating Vencedor on time allowance, although after the race it was announced that she was not sailing in the A classes, but in a special without a competitor, much to the dissatisfaction of many of the yachtsmen of the 21ft. cabin class, as they had been informed before the start that they had to race against Vencedor, and much to the disgust of the Vencedor crew, who had been informed that they were not racing against LaRita. The winners of the first race were:

A CLASSES OVER 30 FEET R.L.

Vencedor first.
 Thor-Bjorn second.
 Widsith third. Michigan broke down.

A CLASSES UNDER 30 FEET R.L.

LaRita, walkover.

B CLASSES AND SCHOONERS.

Sallie first.
 Snipe second.
 Hattie B. third.
 America fourth.
 Vixen fifth.
 Mackinac sixth.

On August 12 the yachts were divided the same as the day previous, and raced in a smashing good whole sail breeze; in fact, all they wanted on the wind. In the A classes over 30ft. R. L. Vencedor won and captured first money, \$50; Widsith finished second, and Thor-Bjorn

third, so they were tied on the two races, and divided the money, each taking \$20; Michigan cut the course and received nothing. In the A classes under 30ft. R. L., LaRita defeated Little Shamrock 22s. and secured first money, \$50; Little Shamrock second, \$30; Outlaw third, \$10. In the B classes and schooners, Snipe defeated Sallie and tied her for first money, each taking \$40, although under the rules Snipe had defeated Sallie the first day, those in charge giving Sallie 10m.; she was late in crossing the starting line, although the race was advertised as a one-gun start. America finished third and tied Hattie B, and they split the money, each taking \$15; Vixen finished fifth and received \$5. Considerable dissatisfaction cropped out at this point, and the yachtsmen fought clear of the event to a large extent, as it was more of a private affair or money-making proposition than a yachting event, there being no yacht club located there.

The following day, August 13, the fleet that had not already gone to Macatawa Bay made the 34-mile run that morning.

On the 14th the Macatawa Bay Y. C. tried to hold its first race of their regatta for all classes, but the wind was so light and fluky that only LaRita, Little Shamrock and Hoosier finished in the order named, and within the time limit. This was not a test of merit, but of luck.

On Saturday, August 15, it rained and blew and the race was postponed until afternoon. LaRita won from Hoosier in the 21ft. cabin class. Widsith won from Thor-Bjorn in class 2A. Snipe first, Eleanor second and Zeta third in Class 4A. America defeated Jeannette on time allowance in Class 2B.

SIR THOMAS J. LIPTON COMPETITIVE CUP RACES.

The greatest event of the season, however, was held off until the last week of August, the Sir Thomas J. Lipton competitive cup races.

The first race of the series was sailed Thursday, Aug. 27, in a stiff whole sail breeze. Seven competitors were on hand at starting gun fire. They all finished but Privateer, and did so in the following order: LaRita, Sprite, Hoosier, Little Shamrock, Pilot and Outlaw.

An attempt was made to sail a race the 28th, but on account of lack of wind the race was called off until the following day. On Saturday, August 29, what was lacking the day previous was on hand in overabundance, the wind blowing 40 miles an hour from the N. E., and kicking up a tremendous sea. Sprite won, followed by the others in the order named, Little Shamrock, Hoosier, LaRita, Pilot, Outlaw and Privateer did not finish.

On Monday, August 31, the gale had abated, the wind only blowing about 25 miles an hour at the start and decreasing to about 15 at the finish. It looked as though Sprite had the cup won for the Chicago Y. C., and it did on its lead in points, except that her skipper made a blunder by trying to outluff LaRita on the last leg of the course, and allowing Hoosier to catch up so that LaRita finished first, Hoosier second, and Sprite third, thus making a tie between LaRita and Sprite, whereas if Sprite had been sailed on a direct course on the last leg of this course it would easily have finished second and won the cup.

On Tuesday, September 1, the tie was sailed off. Sprite secured a lead of 10s. and maintained it by deliberate fouling on two separate occasions, the first 6 miles, and then when in the lead on the wind allowed LaRita to split tacks and get a slight shift of wind and make the windward leg about 3m. in the lead, and finish 4m. 38s. in the lead and just 1m. 15s. within the time limit. More protesting and kicking by skipper of Sprite. As a matter of fact, he should have been ordered out of the race just after the start for deliberate fouling. By this win LaRita secured the cup a second time for the Columbia Y. C.

These three races counted as the fifth, sixth, and seventh of the series of ten for the Thos. H. Webb 1903 championship cup, and gave LaRita such a lead that no other yacht could win, provided she finished in the three remaining contests.

The owners of Little Shamrock were not discouraged at the showing to date their boat had made, but immediately shipped her to Detroit and entered her in the races for the Country Club competitive cup, and their faith was not misplaced, as she won three straight races and brought the cup to the home of the Columbia Y. C. in Chicago. The Country Club races were sailed September 9, 10 and 12 on Lake St. Claire.

On Saturday, September 12, the Columbia Y. C. held its twelfth annual open fall regatta. It blew 53 miles an hour, according to the weather man, and Vencedor won a leg on the Tom Murray cup, sailing the course at a terrific pace.

Then came the match race between Vencedor and Vanenna for the championship of the Great Lakes, under the auspices of the Chicago Y. C. on September 17 and 19. As Vencedor won the first two races with ridiculous ease it secured the cup and championship flag, and the ex-flag ship of the Columbia Y. C. is ready at any time to defend this title, and is particularly anxious to secure a match with the Irondequoit in order to ascertain the difference in speed between this year's model and Canada cup winner and the old Canada cup challenger of 1896. Such a race would excite more interest than the races for the Canada cup did the past season, and for the good of the sport on the Great Lakes it would certainly be a big aid.

After the return of Little Shamrock from Detroit she was fitted out and entered in the three final contests of the Webb cup just to prove their claim that she was as fast as any yacht of the class on the Great Lakes, and the races between her and LaRita were three of the best of the season, Little Shamrock winning all three by narrow margins.

Altogether the season has been a big success, and the outcome is that next year will see more interest in yachting and spirited racing than during the past season, particularly in the 21ft. cabin class, as members of the Country Club of Detroit are having five new yachts built expressly for the Lipton cup races, and to defend their Country Club cup when the Columbia Y. C.'s fleet are sent to Detroit next September to again bring home that beautiful trophy, if possible. The Columbia Y. C. members are preparing a warm reception for the invaders from Detroit, and are building several new yachts for these two events.

In the power boat race the launches Allure, Queen Bess, Standard, Express and Corona won in their respective classes.

*One sailover.

Lanai.

LANAI was built last winter for Commodore A. C. James, of the Seawanhaka-Corinthian Y. C., from designs by Mr. Clinton H. Crane, of Tams, Lemoine & Crane, to be used as one of the team and raced against the Beverly Y. C. in Massachusetts this past summer.

Lanai was designed to be the heavy weather boat of the team, and as centerboarders had shown their superiority in the raceabout class in Buzzard's Bay, it was decided to make Lanai a centerboard boat, and to build her under the raceabout rules of the Beverly Y. C. of Massachusetts—that is, the original raceabout rules of the Knockabout Association of Massachusetts, Beverly not having made the change to the weight rule when the other clubs made their changes in 1901.

Lanai's scantling is the same as called for in the Long Island Sound rules, as also are her beam, sail area, draft, etc., but it was expected that while using the required 3,000 pounds of lead for ballast it would be possible to save a little weight. As a matter of fact, Lanai weighed a little more than 100 less than the 5,900 pounds required by the Sound rules, and in consequence was some 2 in. short on the waterline.

From the start Lanai has shown herself exceptionally fast, not only in the heavier winds for which she was designed, but in any weather stronger than a drifting match.

She raced through May and June with the raceabouts belonging to the Seawanhaka-Corinthian Y. C., Merrywing, Mystery, Natalie, and Jolly Roger, and showed herself conclusively the best of the five.

In a team match against the American Y. C. in a moderate S. W. wind she showed herself so very much superior to any of the six boats entered that she finished the first round $4\frac{1}{4}$ m. ahead of the nearest boat, and on the second round gybed over and went back to the assistance of her team mates, blanketing Rascal, of the American Y. C., and holding her under her lee until Merrywing had passed her, and then going after Howdy of the same club, which had a lead by this time of 75 yards, and again beating her in to the finish for first place.

In the team races of Buzzard's Bay she was able to treat the Buzzard's Bay team in the same way.

After the team races at Buzzard's Bay she went down to Islesboro, and in addition to beating all the boats of the raceabout class there in their races, entered against the Marblehead 25-footers, Chewink I. and II., in a strong breeze, and beat them $2\frac{1}{2}$ m. over an 8-mile triangular course.

She ended her season in Islesboro by beating the Herreshoff raceabout Jilt in a match of two races, the first one triangular, and the second one windward and return. In the windward and return race, three miles to windward and back, she beat Jilt $3\frac{1}{4}$ m. on the windward leg, and ran her another minute before the wind.

Lanai's dimensions follow: Length over all, 34 ft. $5\frac{1}{4}$ in.; L.W.L., 21 ft.; breadth, 8 ft. 8 in.; draft, board up, 4 ft.; board down, 6 ft. 3 in.; sail area, 598 sq. ft.

Mr. Robert Jacob has built for his own use a launch 40 ft. over all, 6 ft. breadth and 9 in. draft. She will be equipped with a 25 horse-power Buffalo engine.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

On Saturday afternoon, Oct. 17, there was launched from the yard of the Racine Boat Manufacturing Co., Racine, Wis., the steel houseboat, built for Mr. John W. Gates. The yacht was named Roxina, and will be used in Southern waters. She is 100 ft. long, 17 ft. breadth and draws 2 ft. 4 in. Roxina will leave for Port Arthur, Tex., in a few days by way of the Illinois and Michigan Canal.

There is building at the yard of the Townsend & Downey Company, at Shooter's Island, S. I., a cruising schooner for Mr. Chester W. Chapin. She was designed by Messrs. Cary, Smith & Barbey, and will be built of bronze. The yacht will be finished as soon as possible, as her owner wishes to make a Southern cruise in her this winter. She is 115 ft. over all, 85 ft. waterline, 21 ft. breadth and 6 ft. draft.

Messrs. Harlan and Hollingsworth, of Wilmington, Del., as members of the U. S. Shipbuilding Company, went into a receiver's hands, together with the other plants that were interested in the deal. Work has stopped in this yard, and thus Mr. Albert C. Bostwick was greatly delayed in securing the auxiliary schooner that was being built for him. The yacht, which is known as the Vergemere, has been taken to Mr. Robert Jacob's yard at City Island, to be completed. Mr. Bostwick hopes to make a Southern cruise in her this winter. She is 158 ft. 6 in. over all, 120 ft. waterline, 27 ft. 6 in. breadth and 16 ft. draft. Her engines will develop 300 horse-power.

At the annual meeting of the Hempstead Bay Y. C., held on Wednesday evening, October 14, the following officers were elected: Com., William P. Miller; Vice-Com., John A. White; Rear-Com., Fred K. Walsh; Treas., Carman R. Lush; Sec'y, De Witt C. Titus; Meas., Fred C. Southard. Board of Governors: William E. Clowes, Charles H. Southard, H. L. Crandall and Marcus H. Tracy. Regatta Committee: Hiram R. Smith, Joseph Rollins and De Witt C. Titus.

The reports of the various committees showed that the club was in excellent financial condition, and there were now eighty-seven active members.

On Thursday evening, Oct. 15, a reception was given at the New York Y. C. to the following members: Vice-Com. August Belmont, Com. Frederick G. Bourne, Capt. J. Malcolm Forbes, Mr. Elbert H. Gary, Capt. Clement A. Griscom, Capt. James J. Hill, Vice-Com. C. Oliver Iselin, Capt. William B. Leeds, Com. Edwin D. Morgan, Com. J. Pierpont Morgan, Capt. Charles J. Paine, Capt. Oliver H. Payne, Mr. Norman B. Ream, Mr. William Rockefeller, Mr. James Stillman, Rear-Com. Cornelius Vanderbilt, Capt. William K. Vanderbilt, Capt. P. A. B. Widener, Vice-Com. Henry Walters.

All these gentlemen have been interested in the defense of the America's Cup in one way or another. There were about 400 members present, and the affair was one of the most successful ever given by the club.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.
Second prize, \$25.00.
Third prize, \$15.00.
Fourth and fifth, \$10.00 each.
Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18 ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. An outline chart of the trip drawn on white paper in black-ink (no coloring pigment to be used) should also be sent in.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 24, 1903.

C. F. WOLTERS,

Commodore-Elect.

JOHN S. WRIGHT, Sec'y-Treas.

Notes from the Delaware.

THE flood of the 10th in the Delaware did a great deal of damage to Park Island. The island was completely covered with water, flooding the club house and bungalows to a depth of over three feet and carrying away many trees. Many of the camping fixtures have been lost and men will be busy for some time making repairs and cleaning up. The Trenton C. C. house was in great danger for some time, but escaped with very little damage, besides much mud over canoes and furniture. The Totowa Club House, adjoining, went down the river with four canoes, and is a total loss; the Hiawatha Club lost almost everything.

Reports from Bordentown and Burlington are that no serious damage has been done.

Rifle Range and Gallery.

Greenville Schuetzen Park.

NEW YORK.—There was the usual group of the Manhattan Rifle and Revolver Association members in the Greenville Schuetzen Park on Saturday of last week. A heavy easterly storm was in force, making the conditions anything but pleasant for the shooters. Dr. W. G. Hudson and Major Ed Taylor were on the rifle range (200 yds.) for the purpose of a little further experiment in ballistics, but there were no experiments, for the reason that the Doctor had entrusted to his wife the packing of his cartridge box, and the good woman had neglected to put in the sights.

H. F. Barning, another worthy marksman, came to the park without an extractor for his rifle. Barning has one of those handy take-down rifles with interchangeable barrels—a good thing when one has all the parts intact; otherwise one is liable to the use of language that is unparliamentary.

L. P. Hansen, by good luck, came to the park with all his truck in good order and nothing shy. Both Hansen and Barning

shot in good form, and, considering the weather conditions, their scores were good. Scores:

L. P. Hansen.....	24 24 21 19 21 23 23 21 22 19—217
	18 20 19 22 21 24 23 24 24 19—214
	23 22 20 19 22 19 19 21 18 19—202
	21 17 21 23 24 23 23 23 25—223
	22 22 22 22 18 23 15 22 25 20—211—1067

Three-shot score:	
Hansen	24 21 21—66
Barning	24 20 15—59
Rifle:	
H. F. Barning.....	23 24 24 12 20 20 19 15 24 23—202
	23 17 22 21 23 18 16 21 17 25—203
	24 20 15 19 24 25 20 21 25 19—212

Down on the revolver range, 50yds., were gathered a small group of revolver cranks who are seldom absent from the Greenville range on a Saturday afternoon. In the group was John A. Dietz, who divided the honors in the Old Guard fair last week with Dr. R. H. Sayre. Dietz was in good form, and put up a score of 50 shots close up to the record mark, making a total of 463 points. A. P. Proctor also shot in good form, and finished with four scores averaging 90. Scores:

J. A. Dietz.....	10 10 10 8 8 9 8 10 7 9—89
	8 9 10 10 10 8 9 9 9 10—92
	9 10 9 10 10 10 10 10 9 10—97
	9 10 10 9 9 10 9 8 10 10—94
A. P. Proctor.....	10 9 8 10 10 9 7 10 8 10—91—463
	9 10 8 8 10 10 9 9 10 9—92
	8 8 7 9 10 10 9 9 10 9—89
	8 8 9 9 9 10 9 9 8 10—89
W. J. Coons.....	8 10 10 8 10 9 8 10 7 10—90—360
	10 8 9 8 9 7 8 9 10 10—88
	10 8 9 8 10 7 8 8 9 9—86—174

The annual Election Day 100-shot championship match, which has been one of the fixtures among our local riflemen for a number of years, will be held on Nov. 3, in Armbruster's Greenville, N. J., range.

The Zettler Rifle Club has taken hold of the shoot, and in the future will make it one of its annual fixtures. The conditions of the match are much the same as in the past—\$5 entrance fee, 100 shots per man. The Hayes trophy, with its annual bar for the best hundred-shot score, and the Armbruster trophy for the best ten-shot score. After deducting all expenses, which includes one of Mother Armbruster's famous dinners, the balance of the entrance money will be divided among the competing marksmen pro rata.

Rifle at Shell Mound.

SAN FRANCISCO, Cal., Oct. 12.—Yesterday the weather conditions at Shell Mound were favorable. M. Blasse distinguished himself in the Germania competition shoot, making 234 on the 25-ring target in his 10 shots. Scores of the day:

Golden Gate Rifle and Pistol Club, monthly medal shoot, Pistol Club trophies: G. E. Frahm 90, Charles Becker 87, G. Armstrong 82, B. Jonas 80, E. C. Cordell 69.

Pistol, re-entry match: Dr. Smith 91, 84, 80; G. Armstrong 89, 86, 86, 84; Charles Becker 87, 86, 85, 85; J. Kullmann, 86, 86; W. F. Blasse 84, 83, 83; G. E. Frahm 84.

Revolver Club trophies: W. C. Prichard 86.

Revolver, re-entry match: W. C. Prichard 91, W. R. Proll 89, 81; Charles Becker 80.

Rapid-fire match, six shots in thirty seconds: S. Carr 53, 49, 47, 39; W. R. Proll 37, 34, 26; Charles Becker 26, 30.

Re-entry match, rifle, expert, Class A: A. Gehret 226, 223; C. M. Henderson 222.

Second Class: M. Kolarer 208.

Club trophy: A. Gehret 226, D. B. Faktor 217, C. M. Henderson 212, M. Kolarer 208, W. Blasse 204, G. Tammeyer 204, G. Armstrong 189, E. Woenne 198.

Medal bars: M. Blasse 214, M. Kolarer 208, 207, 203.

German Schuetzen Club, monthly medal shoot: First champion class, E. E. Mason 229; A. Gehret 229. Second champion class, George Tammeyer 213. First class, D. Salfeld 197; second class, George H. Bahrs 210; third class, A. Schaefer 199. Best first shot, F. P. Schuster, 24; best last shot, F. P. Schuster, 24.

Competition shoot: M. Blasse 234, A. Gehret 221, F. P. Schuster 220, H. Huber 217, N. Ahrens 210, C. F. Thierbach 208, Fred Brandt 202.

San Francisco Schuetzen Verein, monthly medal shoot, champion highest score class: F. P. Schuster 443; champion class, R. Stettin 426; first class, J. Lankenau 410, second class, not filled; third class, John de Wit, 394; fourth class, Edward Doell 340; best first shot, George H. Bahrs, 25; best last shot, F. P. Schuster, 25.

ROEL.

New York City Corps.

THE New York City Corps, captain, R. Busse, finished its outdoor practice shoot for the season of 1903, at Union Hill Park on Wednesday, Oct. 14. The prizes will be distributed to the winning members on Nov. 5. Scores:

Ring target, 10-shot scores: R. Busse 219, A. Kronsberg 219, J. Facklamm 217, R. Schwanermann 210, R. Bendler 196, O. Schwanermann 185, C. G. Zettler 178, Ch. Wagner 174, H. Radloff 171, A. Range 159, A. Frank 133, C. Schmidt 119, J. Riedl 96, II. Bartels 85, A. Wiltz 56, J. Keller 56.

Man target, 3-shot scores: C. Schwanermann 59, C. Wagner 53, A. Kronsberg 54, C. Schmidt 54, C. G. Zettler 54, J. Facklamm 53.

Point target, most points: A. Kronsberg 65, J. Facklamm 47, R. Busse 29, R. Bendler 28, R. Schwanermann 10, C. G. Zettler 7, H. Radloff 6, O. Schwanermann 6, A. Keller 6, C. Wagner 5, C. Schmidt 4, A. Range 3, A. Frank 2, J. Riedl 2.

Bullseye target, best center shot: A. Kronsberg 9, R. Busse 3, R. Schwanermann 2, J. Facklamm 2.

Presque Isle Rifle Club.

ERIE, Pa., Oct. 10.—The club did their shooting on Saturday in a gale of wind, blowing from the northwest, but made very good scores. The scores:

A. Mount	78 72 70—230
E. D. Allen.....	64 59 49—172
J. Bacon	63 63 69—185
J. F. Almeda.....	76 73 66—215
F. Lynch	67 66 64—186

Oct. 3.—The club had a small attendance to-day, though they had a first-rate day to shoot in—no wind and a good light. Scores: W. A. Parker..... 81 79 77—237 J. F. Almeda..... 73 71 67—211 A. Mount

CINCINNATI Rifle Association.

CINCINNATI, O.—At our regular meeting on Oct. 11 the following scores were made, shooting at 200yds., offhand, 25-ring target. Nestler was champion of the day with 227:

Nestler	227 213 212 211 210
Hasenzahl	222 219 216 214 213
Payne	215 212 204 191 199
Lux	207 204 196 191 184
Trounstine	206 198 194 180 174
Drube	202 196 183 158
Freitag	201 196 183 182 176
Hesse	200 193 187 184 180
Roberts	190 188 184 180 179

Mr. J. B. Burnham, of Essex-on-Lake Champlain, writes us as follows: "It may interest you to know that one of my daughters, Miss Rose Burnham, has just won a rifle in the prize competition of the J. Stevens Arms and Tool Company. The boy wasn't in it." The latter sentence refers to his son. Mr. Burnham is an accomplished sportsman himself, having hunted moose successfully in the wilds of Maine, shot big game in other sections, and attained notable skill at target shooting with both pistol and rifle, hence the young lady had every advantage in the matter of heredity.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Oct. 21-22.—Raleigh, N. C.—Third annual trapshooting tournament North Carolina State Fair; \$150 added money. R. T. Gowan, Sec'y.

Oct. 20-22.—Paducah, Ky., Gun Club tournament. W. A. Davis, Sec'y.

Oct. 23-24.—New London, Ia., Gun Club tournament. Dr. C. E. Cook, Sec'y.

Oct. 23-25.—St. Louis, Mo.—Combination live-bird and target shoot at Du Pont Shooting Park. Open to all. Special event, 50 live-bird handicap. Alec D. Mermod, Mgr.

Oct. 27.—Fremont, Ind., Gun Club first annual tournament. J. L. Lint, Sec'y.

Oct. 26-31.—French Lick Springs, Ind.—First grand tournament of the National Gun Club; \$500 added. John M. Lilly, Pres. 1904.

Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Poughkeepsie, N. Y., Gun Club has fixed upon Jan. 1, 1904, as the date for an open tournament.

The rain of Saturday in the East dampened the ardor of the shooters in that section, and the attendance at club shoots was consequently light.

Mr. E. E. Eickhoff, at the shoot of the North River Gun Club, on Oct. 17, scored his third win on the club cup, and thereby established a clear title to it as a part of his personal belongings.

Mr. Royal Robinson, not many years ago one of America's famous shooters, was a visitor in New York on Tuesday of this week. He departed on the evening of that day for his old home, Indianapolis, Ind.

Mr. H. S. Welles, the energetic representative of Messrs. J. H. Lau & Co., 75 Chambers street, New York, arranged to leave for Maine on Saturday of last week for a three weeks' outing in a section where the ruffed grouse does weird stunts in eluding flying shot.

The successful teams in the contests of the Western Pennsylvania Trapshooters' League, April 8 to Oct. 7, finished the season in the following order: First, North Side Gun Club, of Allegheny, 85 points; Millvale, 43 points; Ruffsedale, 35 points; Ligonier, 27 points; Irwin and Brownsville, 22 points each; this tie to be shot off later; McKeesport 14.

After an absence abroad of upward of three months, Mr. Justus Von Lengerke, of the firm of Von Lengerke & Detmold, 318 Broadway, New York, arrived in New York on Tuesday afternoon of this week. He crossed on the renowned Kaiser Wilhelm der Grosse. It is surmised that he enjoyed a combination of work and play in Europe.

For the programme of the Fremont, Ind., Gun Club's first annual tournament apply to the secretary and field captain, Mr. J. L. Lint. Send guns and ammunition to W. N. McKeehen. Moneys divided 40, 30, 20 and 10 per cent. The programme consists of fifteen events, each at 10 targets, \$4 added; \$1 entrance. Handicap contests; winners of first handicapped 2yds., 20yd. limit. The date is Oct. 27.

Mr. John S. Wright, manager of the Brooklyn, N. Y., Gun Club, informs us that the prizes at his shoot on Saturday of this week will be well worth the earnest effort of the contestants. Mr. Wright shot a match with Mr. C. A. Lockwood, of Jamaica, on Saturday of last week, on the grounds of the Brooklyn Gun Club, which Mr. Wright would have won had he broken four more targets. The scores stood 74 to 71 in favor of Mr. Lockwood. Each shot at 110 targets.

Mr. L. H. Schortemeier, with a delicacy which is habitual and surpassingly Chesterfieldian, calls our attention to the fact that the Hudson Gun Club team, of which he was a conspicuous member, Oct. 7, at Sheephead Bay, was second instead of the North River Gun Club, as we inadvertently stated. It may incidentally be observed that Mr. Schortemeier was high man of his team, a matter of importance which is respectfully presented for the consideration of expectant nations.

The programme of the National Gun Club tournament is a work of art, and is full of information. We published a review of it in a recent issue. It can be obtained on application to the secretary-treasurer, F. M. Holloway, Indianapolis, Ind. Keep the dates, Oct. 26-31, in mind. The French Lick Springs Hotel Co. has donated \$500 added money. French Lick Springs is situated on the Monon Railroad, of which the general passenger agent is Mr. Frank J. Reed, 198 Custom House Place, Chicago.

The Jackson Park Gun Club, of Paterson, N. J., was again a sufferer in common with many other property owners and dwellers of that much afflicted city, consequent to the recent floods, the Passaic River maintaining its reputation for responsive destructiveness. With that pluck which has ever marked the Paterson people, the club will proceed to restore its much-injured grounds forthwith. Mr. Garry Hopper, the energetic secretary-treasurer of the club, suffered severely in his business interests, his stock of ammunition being a total loss. He is pluckily readjusting and restocking. It is hard to down a good man or men.

BERNARD WATERS.

West Baden Tournament.

WEST BADEN, Ind.—The first annual West Baden handicap and grand shooting tournament given at this place under the management of that old-time wizard, Mr. John L. Winston, and to which a \$500 purse was added by the New West Baden Hotel, was pulled off on Oct. 14 to 17, inclusive. So far as enthusiasm, depth of interest, splendid grounds, etc., are concerned, it was a decided success.

In view of the location, the magnificent grounds, hotel, equipment, and the fact that \$500 was added to the purses, the attendance was not up to what it should have been. The only way to account for this lack of attendance must be that there has been so much shooting in this vicinity during the past season that the majority of the boys are practically worn out.

In alighting from the train at this little town of West Baden when one looks to the left he sees the typical Hoosier village, but when he turns to his right, he sees across a little valley and seated at the foot of one of Orange county's noble mountains, a magnificent pile of brick, stone, concrete and granite known as the New West Baden Hotel, conceded to be the finest in the world; in fact, upon entering this magnificent structure, one is transported from a little country village to the center of the gayest of metropolitan hostleries, built here for the accommodation of the thousands of guests who come here to seek the benefits to be derived from the many springs which have made this place the "Carlsbad of America." It would be impossible to describe in detail the magnificence and beauty of the New West Baden Hotel; but one must be its guest to fully appreciate what is here. It is built in circular form around an atrium surmounted by a dome 260ft. in diameter, 135ft. in height, and which dome is said to be the largest in the world.

But to the tournament. The earlier arrivals were Tom A. Marshall, Fred Gilbert, Col. J. T. Anthony, who arrived on Saturday previous; and these, with a few of the local boys, spent Sunday together, and on Monday shot at a few preliminary practice birds.

The tournament proper opened on Tuesday, the 14th, a most beautiful day, with the following well-known sportsmen present: C. O. Le Compte, Eminence, Ky.; Stanley Rhodes, Columbus, O.; Ed. Voris and Frank Snyder, Crawfordsville, Ind.; J. B. Stipp, Bedford, Ind.; George Schwartzkopf, Columbus, Ind.; Willard Thomas, Logansport, Ind.; P. Schlicher and Charles Bailey, Marietta, O.; Hugh Clark, Wabash, Ind.; C. E. Binyon, Lowell, Ind.; Tom Marshall, J. T. Anthony, R. O. Heikes, J. L. Head, Charles G. Spencer, John S. Boa, Fred Gilbert, Hood Waters, J. B. Barto, J. W. Gerlaugh and Dr. J. G. Senour, completed the entries of the first day.

The traps are situated in a beautiful little valley immediately in front of the hotel, and are set to face a little north of east, providing a beautiful background. As the three sets of traps worked beautifully, and the targets were fairly easy, some splendid scores were made. One Fritz Gilbert, from the 21yd. mark, topped the professionals, missing but 6 out of 175, and Monsieur Le Compte led the amateurs with 10 misses, but very closely pushed by Hugh Clark and Claud Binyon, each with 11 doughnuts on his plate. The scores of the first day are as follows:

Oct. 14, First Day.

Scores of Oct. 14, first day, ten events, total broken out of 175: Thos. A. Marshall 156, C. E. Le Compte 165, J. S. Boa 156, S. Rhodes 162, Col. Anthony 151, Ed. Voris 164, J. B. Stipp 156, Schwartz 145, W. Thomas 155, J. B. Barto 163, P. Schlicher 155, Chas. Bailey 158, F. L. Snyder 89, H. M. Clark 164, C. E. Binyon 164, F. E. McKay 157, J. W. Gerlaugh 158, J. G. Senour 158, R. O. Heikes 162, F. Gilbert 169, C. G. Spencer 159, H. Waters 156, J. L. Head 150, H. W. Ryan withdrew, J. Keedy 156, E. H. Tripp withdrew.

Fred Gilbert was high gun, losing only 6 from 21yd. mark; Ed Voris made the long run, 89 straight, from 18yds..

Oct. 15, Second Day.

The second day was another bright, sunny one, and the crowd was slightly augmented when A. W. Ryan (Paddy), of Troy, O.; Jim Keedy, of Shoals, Ind., and Ernest Tripp, of Indianapolis, Ind., arrived. Good scores were again the order of the day, as there was no wind to interfere with the flight of the targets. Fritz Gilbert again topped the professionals, with 169 out of 175, closely followed by Col. Anthony, Charlie Spencer and Hood Waters, with 9 misses, while Hugh Clark led the amateurs, with 11 losses. Pop Heikes, who stood alongside Fritz on the 21yd. mark, was going a merry tip, having lost 13 the first day and 12 the second.

The boys expect great things of Pop by to-morrow, as his eagle eye has begun to shine under the influence of these waters. The scores for the second day, 10 events 175 targets, distance handicap, are as follows: Marshall 156, Le Compte 155, Boa 159, Rhoades 158, Anthony 166, Voris 156, Stipp 157, Schwartz 157, W. Thomas 162, J. B. Barto 162, P. Schlicher 154, Bailey 161, Snyder withdrew, Clark 164, Binyon 151, McKay 149, Gerlaugh 156, Senour 139, Heikes 163, Gilbert 169, Spencer 166, H. Waters 166, Head 159, Ryan 149, Keedy 156, Tripp 134.

Oct 16, Third Day.

This was another bright, sunny day, and the crowd was again slightly increased by the appearance of John Amberg, of Chicago; Joe Blistine, of Lafayette, Ind., and Harry Norman, of Louisville. As this was the day for the 100-bird handicap, \$250 to be added to the purse, great interest was manifested, and, as the wind kept very quiet, good scores were expected. There were five 15-target races on the regular programme, to be shot before the big race started. Some very good work was done, Mr. Le Compte going out with a score of 75, while "Hiz-zonner," T. A. Marshall, got very busy and skimmed along with 72 to his credit. Jim Head, Pop Heikes and Fritz Gilbert formed a short squad of three, and from their respective marks, 18, 21 and 21yds., did some very creditable work. In one series of events the three of them broke 162 out of 165 targets. The first half of the big race was shot before lunch, and some of the boys were feeling mighty good over their splendid start, Hugh Clark and John Gerlaugh having 49 as a beginner, closely followed by Heikes and Marshall with 48, and there was a whole squad of 47s. After an hour's intermission and a big lunch, the race was again on. Hugh Clark, who was shooting from the 20yd. mark, seemed to have the best chances to land the winner, but during the noon hour his face, which was being badly punished by a new gun, had a chance to get a little sore, and he got a bad start right after dinner, losing 2 of his first 3. About the time 75 had been shot at, it was plain to be seen that one Mr. R. O. Heikes, of Dayton, O., would have to be reckoned with when this pot was split, as he had lost but 2 out of that number. When he, with Jim Head and Fritz Gilbert went down to No. 2 set of traps to come under the wire a large crowd of interested spectators followed him up mighty close. Pop was back at 21yds., but he had his old Remington pointing about right and was surely hitting 'em on the nose. He went down to

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, OCTOBER 31, 1903.

VOL. LXI.—No. 18.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

OUR CHRISTMAS NUMBER.

THE Christmas Number of the FOREST AND STREAM will be the regular issue of December 5. It will be enlarged and handsomely illustrated, and the cover will be printed in colors. The price will be 25 cents. Order from your newsdealer in advance.

DOWN THE MISSISSIPPI.

RAYMOND L. SPEARS, whose unique relation of experiences on "A Walk Down South" attracted so much attention and was received with so much favor as published in these columns, has undertaken, under commission from the FOREST AND STREAM, an extended expedition down the Mississippi River, starting from St. Louis in a small boat and proceeding as far toward New Orleans as the time to be devoted to the trip shall allow.

Mr. Spears will study the phenomena of the great river, the natural history, and the people. There is no more interesting section in this country; and Mr. Spears has in his "Walk" demonstrated his rare capacity as an observer of things that are worth seeing, and his skill in the delineation of them. Our St. Louis contributor, George Kennedy, wrote the other day: "I have traveled many hundred miles with that wonderful man who sees things and tells what he sees. He should always travel and always write about his travels."

In the Mississippi country Mr. Spears will find of things to see and describe a very embarrassment of riches. His letters will be one of the most notable features of these columns in the months to come.

COLORADO DEER SKINS.

A CASE of great importance to the protection of Colorado game is before the courts of that State. It is one arising from the confiscation of 300 deer hides which the authorities claim were unlawfully had in possession. The warden seized them, the dealer from whom they were taken sued to recover them and won his suit, and the State has appealed from the decision. The importance of the final adjudication of the case is well indicated in the paragraph of the argument for appellant in which the meat and hide hunters and buyers are truly characterized as, except the beasts of prey, the most heartless and persistent enemies of the game. If this case shall be lost by the State the effect upon protection will be most deplorable. The District Attorney is fortunate in having for an associate in the case one whose interest in game protection is so warm as that of Mr. Beaman, and one who understands so thoroughly not only the legal principles involved but the true relation of a perpetuated game supply to the good of the commonwealth.

Mr. Beaman has had large share in the development of the Colorado game law, which is to-day among the most sensible and comprehensive of our game codes. It makes recognition in full measure of what has come to be accepted as a basic principle of adequate game protection, that the sale of meat and hides must be prohibited. This is saying, in another way, that the game is for the people, all the people, and not for a few butchers and dealers. Colorado has found out, as other States in the West and in the East have proved, that prohibition of selling is an absolute essential of any scheme of protection which protects. The outcome of the case now before the court will be looked for with an interest by no means confined to Colorado.

THE PASSING DAYS.

How few of us know the pleasures of outdoor life, or, knowing them, enjoy them as we might and should. We are brought up to believe that business is the most important occupation of life, and that time is money, and so we stick to our desks and miss many innocent and healthful amusements that lie within our grasp, if we only knew it. There are few men who would not work better and live better if out of every week they took one day to spend abroad in the country, enjoying the sights, sounds and pursuits so easily accessible to all of us, and so foreign to our daily lives.

The passing days of autumn are especially attractive. All nature is astir with slow movements—the gradual changes which presage the coming winter, when our world shall sink into the long sleep which will end in another beautiful awakening. The fields, still green for the most part, though patched now and then with brown, are dotted with autumnal flowers, and fringed with hedges and woods, yellowing in their ripened frondage, while here and there the flame-colored foliage of hard maple, or Virginia creeper, or late sumach, brightens the landscape with touches of brilliant crimson.

If one goes out now with dog and gun, he may follow up the course of some brooklet, beating the alders and birches which spring from the moist soil, in the hope of starting a russet woodcock, and then turning into a wide corn-lot, may push his way through waist-high ragweed and among shocks of yellow corn. At each step a hundred little sparrows or warblers spring from the weeds where they are feeding. The dog, as he quarters the field, shows now and then dimly white through the weed-tops. Over the woods beyond, black-winged crows are slowly faring, silent now, where a month or two ago they were gathering together in tumultuous conclave.

Plunging into the woods, the good dog may strike the trail of the ruffed grouse, which, if old and wise, may rise far ahead, with its sound of distant thunder; or, if it be a bird of the year, may run and stop, as the careful dog draws after it, until finally, when it takes wing, it may be within reach of the ready gun, and before it has gone many yards may fall to the quick shot.

Beyond the woods are other stubbles, one of buckwheat, from whose border the quail this morning have run out, and, scattering themselves among the thin stalks, are now feeding. A light breeze brings their scent to the dog's nose, and before he has got far into the lot he stops; then, as we come up on either side of him, he moves cautiously forward. Little by little he crouches lower and lower, until finally he is crawling on his belly, and at last comes to a full stop, showing us what is not often seen to-day, the real setter dog—a dog which sets his game. As we step forward, and as the rattle of wings falls upon our ears—a roar which always sends the blood a little faster through the veins, and is likely to make the gunner shoot too quickly—we try to select our birds, but we shall do well if we get a single one for the two barrels; and, indeed, when retrieved, it may appear that the birds should be left, for they have not yet attained their full size, and are not fit to kill.

Let us take then an old and little used road, which shall lead us to another covert, where a woodcock or two may be found. On either side the road are tracks for the infrequent wheels, and between them another track where the feet of horses have worn down the grass. Late goldenrod and asters spangle the vivid green which lies everywhere between the tumble-down stone walls marking the boundaries of the road. On either side great birches hang over it, yellow now from lowest branch to topmost twig, and dropping through golden sunshine leaves yet more golden in a continuous shower. The October sun shines warm; the October haze hangs a delicate veil between us and objects a few hundred yards away. Scarcely a sound is in the air, except now and then the subdued chirp of some tiny bird or the distant call of a bluejay, changing his location in the nearby wood.

Such days are too perfect to work in, and he who spends them confined within four walls is missing more than he knows of pleasure and of inspiration. Such days are for contemplation, for the enjoyment of the beautiful things in nature, and he who spends them abroad bears with him on his return—whether his game bag or fishing creel or collecting case be light or heavy—

a reward far greater than may be measured by money gained or meed of success won in the pursuits of store or office.

Each one of us ought to take advantage of such days, of which so many come at each season of the year. He who goes much abroad will never find two days alike, and in each day will find some pleasure not had in any other day. Each season has its own peculiar pursuits, its own vivid interests, its own especial charm. It is well to go abroad for shooting, or for angling, or to observe the birds, or to gather the flowers; yet the purpose for which one goes is not important; what is important is that he shall go.

The world is too much with us; late and soon,
Getting and spending, we lay waste our powers:
Little we see in Nature that is ours;
We have given our hearts away, a sordid boon!
The Sea that bares her bosom to the moon;
The winds that will be howling at all hours,
And are up-gathered now like sleeping flowers;
For this, for everything, we are out of tune;
It moves us not.—Great God! I'd rather be
A Pagan suckled in a creed outworn;
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea;
Or hear old Triton blow his wreathed horn.

—Wordsworth.

FIXED.

In these days of restricted shooting areas and growing difficulties of finding for oneself desirable shooting opportunities, a leaf may be taken out of the experience of a New York man, who, by the exercise of an engaging personality, has secured for himself an exclusive shooting over a well stocked preserve. It is not a preserve in name; the shooter has no actual title to it, not even a lease; but he holds the ground year after year by the simple power of good will and personal agreeableness to the owners. A decade ago this New York sportsman found himself in a section of North Carolina not frequented by gunners from abroad. There were no hotels nor any special inducements for the tourist sportsman, beyond the one essential of a moderate game supply. Having persuaded a farmer to take him in as a boarder, he enjoyed the season's shooting, and at its close had formed friendships which prompted an invitation to come again. A second visit not only strengthened the friendship already made, but widened the circle of acquaintances, and with each succeeding year the visitor's part in local interests has grown. The question of where to go for game, which vexes so many, gives him no trouble. He is "fixed."

CHARLES P. FRAME.

ON Thursday, October 22, Charles P. Frame, of this city, died suddenly on a sleeping car near Indianapolis, Ind. Mr. Frame was born in Brooklyn, L. I., and educated at Flushing. As a boy he entered a fire insurance office, and his ability and attention to his work won him rapid promotion. When he went into business for himself he was very successful, and the firm Frame, Hare & Lockwood, and their successors, Frame & Hare, were widely known in insurance circles as successful houses. Mr. Frame retired from business some years ago. At the time of his death he was in his 64th year.

Mr. Frame was always an ardent sportsman, devoted especially to gunning, and above all to duck shooting. For many years he, with a number of friends, among whom were Mr. Frederick W. Leggett, John B. Lawrence, Jr., and D. G. Elliott, the ornithologist, visited with great regularity Albert Lea, in Minnesota, and Puckaway, Wis., where they had wonderful duck shooting. Later, Mr. Frame was a member of the Narrows Island Club, of Currituck county, N. C., and there he had great shooting. At the time of his death he was a member of the Laurentian Club, of Canada, which he visited every year. Latterly Mr. Frame had turned his attention more to angling, and did less gunning.

Mr. Frame was a man of singularly genial manners and of an unusually sweet nature, and of those who met him, there were few who did not wish to know him better. Enthusiastic as he was about shooting, he was at the same time a man of very even temper, cool and ready for whatever might turn up. His death causes deep sorrow to a very large circle of friends.

The Sportsman Tourist.

The Passing of October.

THE oak's red and the maple's gold
All day seem shivering in the cold;
Fleece-lined the clouds go hurrying by
The young moon mounting in the sky;
At morn a million dew-gemmed leaves
Are rippled by a vagrant breeze;
Far off and lonely floats the swell,
The music of the old school bell.

All day the squirrelys bark in the trees,
Bold sunflowers nod at every breeze;
The nuts thud down at early morn,
And eddied leaves wood ways adorn.
The smoke lies brooding on the hills,
While dream-like tinkle all the rills;
October yields to Queen November's sway,
And ushers in the winter's roundelay.

WM. FELTER.

BLUE MOUND, Kansas.

A Dry Camp.

Editor Forest and Stream:

Some time since, while trying to give an explanation as to how a sergeant came to be shot when an officer had ordered a blank cartridge to be fired at him, I said that this officer was probably a young one who would learn more as he grew older.

I had in mind just then another young officer who was in the process of learning when I came in contact with him; and both he and I learned something. He found out that he did not know it quite all, and I found him to be a different man from what those that knew him better than I did thought he was. I succeeded in teaching him something, as he afterward told me.

Some of these young officers, when they leave West Point, imagine that their education is complete, others have sense enough to know that there are many things that they cannot and don't try to teach at the Academy; these have to be learned in the field.

The cavalry gets some of the best of these young men; they are assigned to the different branches of the service, according to their standing in the class, the engineers getting the first two or three, then the next dozen or more go to the cavalry; those at the lower end of the class go to the infantry.

It has been a pleasure to me to teach what I knew to some of these young officers, in a different manner from what I took to teach this one, but these other officers wanted to learn what they did not know already. I remember one who, after he had joined the troop, would put in an hour at a time asking me questions on almost every subject, from the distance a line of telegraph poles were placed apart (twenty-six of them to the mile in that case, I told him), to the formation of the different rocks in the wall of a canyon, or the depth at which water would be likely to be found where we then were; the difference between the regular and volunteer soldier's gloves; a full history of General John A. Logan (Black Jack), after he had seen me talking to him; all I knew about shotguns, rifles and dogs; and what I thought was the best all around hunting dog. Every time I met him he had a new list of questions. He afterward transferred to the infantry and fell while leading his company at Santiago, Cuba. He was my favorite among all of these young officers I had ever come in contact with. His name was Walter M. Dickinson.

A man who had never been nearer West Point than I had, could, if he had paid any attention to the country that he had been in, tell one of these young officers about it. They are not expected to know anything about it until they are told.

I never visited any part of a country without making a mental note of its features, and marking down on my map the places where I found water, besides making a note of it in my diary. It might come of use to me or to others some time in the future. I was once sent from Camp Charlotte, Texas, with one of these young officers, who was making his first scout, without having an older officer with him; and at the start he thought he did not need to be told about the country. Afterward he revised his opinion, and after that did not disdain to learn even from me. I often told him about things afterward without getting myself snubbed.

The first camp we made after starting, and when not twenty miles away from the post, was signaled by his putting on a guard of four posts day and night. He had a detail of about thirty men out of several different troops, and this guard would take nearly half of them. One of our old officers would have had probably one post on, or at most only two; they would act as picket in the day time and as herd guard at night.

I knew but little about this "cadet," as we called these young second lieutenants; he did not belong to my troop, but he had a sergeant of his troop with him; and I said to the sergeant that in my opinion we would not get many nights in bed on this trip.

"You will be lucky to get any," he replied. "Wait until you see more of this fellow. We have had to teach officers before now things that they forgot to tell them at West Point; but don't try to teach this one anything, you can't."

We kept on going west for several days after this, and were now getting into a country where water was rather scarce; and if we kept west another day we would strike a country where there would be no water at all. I thought that the officer knew that; it seems he did not.

The country west of us was almost a desert. I had

crossed it and knew what it was; and when we again headed to the west on leaving camp, I said to the sergeant, who had warned me not to try to tell the officer anything, "You should tell him now just what kind of a country he is heading for. He does not know this country, of course, and is going it blind."

"Well, if I ought to I won't. You can tell him if you choose, and get yourself snubbed. Did I not tell you that he knows it all? You can't tell a man like him anything."

"I'll tell him, then, and let him snub me, I can stand it. Neither I nor my horse want any dry camps if we can avoid them."

We had been riding across dry grass so far; but now came to where the grass had been burned off, and only lately, too. The new grass had not begun to spring up yet, and as far as we could see to the west the prairie had been burned over; it might extend clear to the Pecos River, away over in New Mexico.

He will turn back now, I thought, he can see that the country is all burned over. But he kept on.

If there can be found a more uncomfortable country to ride over than a burned prairie, I have never found it. The dust on a dry plain is bad enough; but these dry ashes, when they are stirred by the horses' feet, almost choke both horse and rider; and the hot sun that beats down on your head, hot enough to give a man who is not used to it the sun stroke, does not help the matter any.

At the end of five miles we halted to dismount and rest the horses. Rest would be all they would get here; there was no grass for them to eat while resting.

Going up to the lieutenant I said, "You are going into a country now, sir, in which you cannot find a drop of water in the next forty miles. I thought it was my duty to tell you so, as you may not know that country." I knew very well he did not know it.

He looked at me a moment, then asked, "How do you know I cannot find water?"

"Because there is none there, sir, to find. There never is. It is a desert. I have been across the country coming from the Pecos on about the same trail we now are on, and in over forty miles out here the only place I saw that would possibly have water at any time was one shallow pond, about twenty miles from here. It had none then and will hardly have any now."

"Why did you cross it then?"

"We had to cross it somewhere, sir. One place would be as good as another. There is no water anywhere this far south on it. We had to make a dry camp there when we did it. But there was good grass then; there is none now, you can't camp on this burned prairie; and it may extend nearly to the river, 100 miles west, I think it does."

"Oh! I'll find you water, don't worry. Who sent you to me?"

"No one, sir. I came of my own accord."

"Well, let this be the last time you come. When I need any information about this country, I will let you know."

"Yes, sir," I said, and again saluting him I left, and said to myself, "When you do let me know any information you get from me won't be of much use to you, when you come to be examined for your next promotion."

"Well, how did you and he make out?" the sergeant asked. I told him.

"You are lucky. I expected to see you walk and lead your horse from now until we make that dry camp he is heading for. You would have had to do it, only he does not even know enough to punish you."

"Well, if he did, I know enough to report him afterward, don't I? And he may know that I would do it. That may account for my not having to walk and lead any horses."

We kept on across the burned grass until noon; then the trumpeter dropped back to tell me that the lieutenant wanted me. He had sent for me sooner than I expected. I rode forward and gave him another salute. I was afraid now that the idea of making me walk had just occurred to him, and I would now get the benefit of it.

"Where was it you saw that place where you said there might be water at times?"

"About fifteen miles to the southwest of this, sir, I think. It may be more. On account of this grass being burned off here, I hardly could be sure. I could go to within a mile or two of the place, then circle for it, but it would be of no use; there would hardly be one chance in a hundred of us finding any water there. In the wet season there would be water for some time in it. I noticed that it had a clay bottom. That would hold the water for quite a while."

"Well, we have had quite heavy rains out here lately."

"Yes, sir, we had them east of this; but I do not think that it rained this far west. I have thought that this prairie here was burned about the time that rain fell, it has only been burned over about three weeks, I think."

"Who burned it?"

"The Indians did, sir, or the cowboys. It may have been burned by accident. It was set fire to east of this and the fire traveled west."

I saw now that he was not half as confident of finding water as he had been a few hours before. An old officer would have turned back now had he come this far; but he would not have come even this far.

We kept on and in an hour got off the burned grass. The fire had suddenly gone out here, I thought, from a change of the wind then, afterward I concluded that the rain had put it out. I had found the water then; it had rained this far west.

Now I could form a better idea of what part of the country I was in, and after some study I came to the conclusion that we were still away east of that pond.

We kept on until sunset, but found no water; and now made the dry camp that I and my horse did not want. I got my saddle off and had led my horse out on the grass; then looking to the west from where I stood beside him, I saw now that I knew where I was, and coming in I said to the sergeant in charge of us; he was out of my own troop, "I am going to find

water, I think. Will you have a fire started to guide me to camp again?"

"Yes, go ahead, find us water if there is any in the country. I'll give you fire enough." And he ordered it started right away. Taking his canteen and mine, and my carbine, I went straight southwest, and had only gone a mile until I almost stepped in that pond of mine. It was where I had thought it was and was full of water. I drank all I wanted, then filled both canteens and came back.

"Now, don't say anything to the lieutenant about this," the sergeant said to me. "We don't want a half night's work watering horses and mules. He was so anxious to make a dry camp that he came all the way here to make it, blank him, let him get the full benefit of it."

"But I want to take his dog robber with us to get water."

"Well, you won't. Let them go without water. We want to teach that fellow a lesson."

The sergeant had all the camp kettles sent for water. I was taking a small one.

"I don't want you to carry any," he told me. "I'll send men enough. You go in charge of them."

"I want to bring this in full for your horse and mine, I'll carry it," I said.

We brought in plenty of water, and I gave mine to the two horses I had carried it for. Then going to the sergeant I said, "Now, I want to call the dog robber and give him enough water for their supper. We can tell him that we only found water enough for coffee. I don't want to put in half the night in watering horses any more than you do."

This "dog robber" was a man whom the lieutenant had for a servant; most officers have one; he is always a man who is hardly fit for anything else, and would rather carry wood and water for a cook, black boots, groom the officer's horse and nurse the baby if there is one lying around loose (and there generally is), than do his duty in the company. The only part of his work that I would ever do would be to nurse the baby if it happened to be a boy baby; I have done that for Mrs. Captain, but drew the line at girl babies; I did not want them and they seemed to know it.

Calling the dog robber, I gave him the water and told him what to tell the lieutenant when he asked about us having it—"tell him we found enough for coffee, and let it go at that."

After supper we made another trip to the pond for water for breakfast, and I got more for our two horses; they and we made no dry camp of it, anyhow.

Next morning, after breakfast, the lieutenant sent for me again and wanted to know about that water.

I told him all about it.

"Why did you not report it to me when you found it?"

"You had not sent for me, sir. You remember what you told me yesterday. I never have to be told the same thing twice."

"Tell the sergeant to have the stock watered, and then put out on fresh grass; I will remain here in camp to-day."

We watered them. Then taking my carbine I said, "Now I am going hunting; that is, if his nibs will let me."

Going up to him I asked to be let go hunting.

"Why, certainly. Did you want your horse? You can take him if you do."

"No, sir, I want to give him a rest."

He hesitated a moment, and then said, "I was too hasty yesterday when I spoke to you as I did. I am sorry now that I did not listen to you, and think it only right I should tell you so."

"The fault was mine, sir, I had no business to give you any advice until you asked for it."

"Oh, yes, you had. You knew this country and I did not. I should have thought of that. You did right in trying to tell me, and after this any time you are with me and think of anything which I ought to know don't hesitate to let me know it. None of us ever get to be too old to learn, and only a fool refuses to learn what he does not know. I don't want to be considered a fool."

"He is a gentleman after all, I thought. A good deal like myself maybe in not wanting to be told anything he or I are paid for knowing, but he can resent being told, I can't."

We filled up our horses with water next morning, drank plenty ourselves, and took all we had canteens for with us, then started back to the camp we had left to come here, and made it in good time; and from there scouted the country for a few weeks more, but took care not to make any more dry camps. I was with this officer many times after this, and more than once told him what I knew about the country we happened to be in at the time, but never got another snub from him, and never asked him for a favor that I did not get. He got his two promotions in his turn and died a captain a few years ago out in California.

CABIA BLANCO.

Connecticut Trespass Law.

A DRASTIC game law, passed by the last Legislature, will probably be put to the ultimate legal test by the sportsmen of New Haven, says the Register, and it may prove a casus belli between the city sportsmen and the farmers of the State with serious consequences.

This law converts every farmer into an officer of the law with power to arrest a hunter found on his land. It doesn't say that the huntsman shall be caught in the act of hunting; if he is found carrying a gun or with a dog, the law says he shall be deemed a trespasser of the law and liable to arrest.

This law was opposed by the sportsmen of the State, but it went through because the farmers insisted upon having it. Good lawyers say it is unconstitutional, because it is class legislation and transgresses human rights. It also creates a mushroom constabulary without warrant.

Moose Hunting in New Brunswick.

PRESIDENT ROOSEVELT, in his book, "The Wilderness Hunter," says that the moose is the largest and noblest game in the western hemisphere, and that the antlered head of one of them is the most highly prized trophy that a hunter can secure. With this in mind, we decided to go moose hunting, and, upon inquiry, learned that New Brunswick is probably the best place in the world for them. The party consisted of Senator Spencer K. Warnick and the writer.

We started for New Brunswick on Friday, September 11, having previously engaged guides by letter. Our route took us over the Boston & Maine, Maine Central and Canadian Pacific railroads, via Boston and Portland, Me., and we arrived at Perth, New Brunswick, Saturday afternoon. Here we purchased our hunting licenses, which permitted us to kill one bull moose, one caribou and two deer. After a wait of a couple of hours we boarded a combination passenger and freight train, which slowly crawled up the valley of the Tobique, over a primitive roadbed. After being "well shaken" for twenty-two miles, we got off at Reed's Island, where we spent Sunday at the home of Charles Wright, with whom we had made the arrangements for our hunting trip.

We were bound for Mr. Wright's camp, near the head of the north branch of the Miramichi River. Mr. Wright built his camp in 1900, and, in accordance with the custom which all New Brunswick guides respect, the erection of this camp gave him the exclusive hunting privileges of the surrounding country. We found this to be a great advantage, for during our stay of eighteen days in the woods we neither saw nor heard any other hunters.

Early Monday morning, September 14, we started from Reed's Island on our all-day journey of twenty miles through the unbroken woods to Wright's camp. Our baggage and provisions were loaded in a large lumber wagon and hauled in by team, while we, with our guides, trudged along behind. We saw frequent moose and deer tracks, and flushed numerous partridges, in which the region abounds. Toward evening we arrived at the camp, which we found to be a snug little log cabin, furnished with bunks, cook-stove, table, etc., and we were soon comfortably established.

Our guides were Herbert Camber and Robert Torrance, both of Arthurette, Victoria county, and their ability is evidenced by the success of our moose hunt. Herbert is a veritable giant, weighing 225 pounds, strong as an ox, good natured, willing and sociable, and a skillful woodsman, axman, and cook, while Robert possesses all the qualities that are found in the perfect guide.

Tuesday afternoon we all started out to look over our hunting ground. It is located about a mile and a half from camp, over a good trail, and consists of a deadwater about fifty yards wide and a mile long, resembling a long, narrow lake. Here the cow moose come in to feed upon the lily roots early in the morning, and late in the afternoon during September. The cows have no antlers, and are protected by law, but our licenses allowed us to shoot one bull moose each. The bulls seldom feed in the water, but in the fall of the year frequently accompany the cows as far as the banks, where they keep pretty well out of sight among the trees and bushes. As a result, it is difficult to get a shot at the old bulls, for they are very cunning and wary. Lucky, indeed, is the hunter who gets a chance at a moose with a good set of antlers. Even then the shooting through the brush and trees is difficult and uncertain, when perhaps only a pair of horns or a head is visible. There is also a spice of danger in the operation, for the bull moose sometimes attacks the hunter, especially in the mating season.

A popular method of hunting the moose is by calling. The guide imitates, through a birch bark horn, the call of the cow, and the bull, hearing it, comes crashing along, only to be shot by the hunter, who is lying in wait for him. We did not practice calling, as the season was too early for it.

On the afternoon in question we paddled our canvas canoe down the deadwater, and during the trip saw two cow moose, both of which would have been easy marks. During our hunting we saw a good many cow moose and always found them quite tame. They seemed to know that they were protected by law, and that we would not harm them. On several occasions we approached as near as ten or fifteen yards to a cow before she condescended to leave the water, and then she seemed unconcerned and not at all alarmed.

We noticed brook trout jumping in large numbers, and were informed by the guides that the water had probably never been fished. We decided that it soon should be, however; so later on we hunted up some flies, and caught trout until our arms ached from casting, each cast landing a fine fish. Thereafter fresh trout was a pretty frequent item on our bill of fare. The trout are so ravenous that they will take almost any kind of bait or fly. On one occasion, having hooks but no flies, I cut a small piece of white felt from the lining of my hat and attached it to a hook. Meanwhile the guide had cut a moose-wood pole which was so heavy that two hands were required to manipulate it. Thus equipped for the game of all fish, I made a cast, and landed a fine trout, and continuing soon had a fine string. We also caught trout with salt pork for bait, and with flies which we manufactured out of red twine.

At the foot of the deadwater we found a small open camp, which had been built by some lumbermen, and this we decided to utilize in our hunting, as it was right on the deadwater, while our home camp was a mile and a half from the hunting ground. Our plan was to take turns hunting the deadwater. One of us was to go down in the afternoon for the evening's hunting, spend the night at the open camp, get in the early morning's hunting, and return to the home camp in time for dinner. In the afternoon the other would start out with his guide and repeat the programme.

The Senator took the first try at the deadwater, starting the afternoon of Wednesday, the 16th, Robert guiding him. They took along blankets and a small supply of grub, and hunted that evening and the next morning, spending the night at the open camp. They saw six moose, but only one of them was a bull, and he was a two-year-old with spike horns, so he was not disturbed.

On Thursday, the 17th, I hunted the deadwater with Herbert, but there was a high wind which kept the moose away from the water. We caught a nice lot of trout for supper, and spent the night at the open camp. We started on our hunt the next morning at about 6 o'clock, without stopping to eat breakfast. As I settled in my seat in the bow of the canoe, the guide remarked that he felt it in his bones that something was going to happen. I, too, felt a presentiment; so every sense was on the alert as we slowly paddled up the deadwater. Everything was in our favor, as not a breath of air was stirring. We had gone not more than a quarter of a mile when we saw a cow moose standing in the middle of the stream, in about six feet of water, feeding from the bottom. She would dive down and stay under water for at least a minute, leaving only a few inches of her back visible above the water. It was an amusing sight, and as her head was under the water most of the time, we paddled to within a few yards of her before she came up for a breath of air and saw us. She then got out as fast as she could, making a great splashing.

At the same time we heard a crackling noise on the right bank, about two hundred yards up stream. Looking in that direction, we saw protruding above the bushes the head and neck of a magnificent bull moose, standing there with a cow. Evidently the noise made by the first cow in getting out of the water had alarmed him, for he turned and saw us, and started off into the woods at once. "Let him have it," said the guide. The critical moment had come. Bearing in mind that the first shot is the one that counts, I drew a very careful bead, aiming well forward, and fired one shot from my .33 Winchester. He quickly disappeared in the woods. We landed immediately, and, in an agony of doubt, made the best of our way through the bushes to the spot where he had been standing. Great was my relief to find a large splash of blood on a tree, about five feet from the ground, which showed that the bullet had struck its mark. Then ensued a wild scramble over fallen trees and through bushes in the direction he had taken, being guided by the noise his horns made striking an occasional tree. After going about 300 yards we caught sight of the antlers of our game above the trunk of a fallen tree, behind which he had dropped down, mortally wounded. "He's a big one," said the guide, "and I guess he's our meat."

On our approach the huge beast got up, though feeling pretty sick, and started off, but another shot staggered him, and at the end of fifty yards he again dropped down. I now came quite close, at the same time taking care to keep well out of reach of his horns, which he still had strength enough to shake at us, and fired two more shots just back of the forward shoulder, which put an end to his sufferings.

He was a large moose, very fat, and would weigh about eleven hundred pounds. He measured seven feet from the top of the forward shoulders to the ground. His antlers were large and handsome, and had a spread of 52 inches, 21 points, and a palm 11 inches wide. We skinned out the head for a trophy and the hind quarters for meat. Upon examination we found that the first bullet had struck him in the neck, close to the forward shoulders, and had inflicted a mortal wound. The second shot took effect in the hind quarters, high up. We packed the head to our home camp.

At the camp we were visited by two men who were looking for a horse which had strayed away from a lumber camp, and had been lost two weeks in the woods. The men were following the tracks, and camping in the woods whenever night overtook them. They spent the night with us and had not been gone two hours next morning when we heard the tinkling of a bell, and soon the lost horse walked into our camp, wearing all his harness except the bridle, and apparently none the worse for his wanderings of many miles through the dense woods. The fact that during that time nobody saw him nor heard his bell shows the wildness of the country.

Saturday afternoon the Senator and his guide Robert started early in the afternoon for the foot of the deadwater, preparatory to hunting that evening. About half way down the stream they came upon a large cow moose feeding in the water, and paddled to within twenty yards of her before she took alarm and got out. It was an excellent opportunity for a photograph, as the sun was shining brightly, but, unfortunately, the camera had been left at camp. Later in the day they saw a young bull moose, which was too poor a specimen to shoot.

The Senator and Robert spent Sunday night in the open camp, and started up the deadwater in the canoe about 6 o'clock Monday morning, September 21. They had almost reached the upper end when, upon rounding a bend, they caught sight of a large set of antlers projecting above the bushes on the right bank. The horns moved, and soon a monster bull moose stepped into view. This was the Senator's opportunity, and he made the most of it. He fired four quick shots and got ashore as quickly as possible. In doing so he slipped into a quagmire, which the guides call a moose bog, and had considerable difficulty in extricating himself. Meanwhile the moose had disappeared, but a few drops of blood were spattered on the bushes here and there, and, as afterward appeared, two of the four shots had taken effect, one in the neck and the other in the forward shoulder. Following the blood drops with great difficulty, they slowly tracked their huge quarry, and after a search of about three-quarters of an hour spied him lying down in a dense piece of woods, badly wounded. He staggered to his feet and started off, but several more bullets quickly put an end to him. He was a large moose and had a magnificent pair of antlers, with a spread of 52 inches and 26 points. They were beautifully palmated, and measured 14 inches in width at the broadest place. A finer head is seldom seen. After being photographed, it was carried to the camp, later to be mounted. Both heads were subsequently shipped to Vanceboro, Me., where they are now in the hands of the taxidermist.

In six days of hunting we had each of us killed a very fine moose, and we were now prepared to enjoy the luxury of camp life, which we did for several days to the fullest extent. We feasted upon an abundance of fresh moose meat, which closely resembles beef, and is excellent eating.

On Friday, the 25th, we decided to try for caribou. Loaded down with blankets, grub, cooking utensils and

rifles, we traversed five miles of rough country, the trail at times being nothing more than a line of blazed trees, and finally arrived at our destination, which was a barren about eight acres in extent. It is a sort of moss-covered bog, surrounded by dense woods, and so wet that no trees will grow there. The caribou come here to feed on the moss.

After preparing camp, we took up our positions in the middle of the barren and watched until sunset, but no caribou appeared. We were about to give it up when we heard the horns of a bull moose rattling against the trees in the woods nearby. Herbert and I went over to the edge of the barren to see what was doing, and crouched down in a clump of bushes. Soon a cow moose emerged from the woods very near us, and walked out into the barren. After an interval a large bull moose followed her. After a while he saw us, and stopped. The poorest of marksmen could not have missed him as he stood there in the open staring at us for several minutes, not twenty yards away, broadside to us, bigger than a horse. As I had already killed one moose, which is all that the law allows, shooting him was, of course, out of the question, though the temptation was strong. We kept pretty still, as we were so near that we thought there might be some danger of his charging us, but he finally got scent of us and quickly turned and trotted into the woods, preceded by the cow. One seldom has an opportunity to observe a live bull moose at such close range, and we considered ourselves very fortunate.

The next morning we returned to our home camp, having seen no caribou.

There occurred one more interesting incident to mark the close of our hunting adventures. While returning along the trail from the deadwater one day we suddenly came upon a large black bear. Upon seeing us bruin lit out pell mell through the dense undergrowth. I got in one snap shot at him as he scurried through an opening in the thicket, but missed, and the bear is probably running yet.

No one who visits New Brunswick can fail to be impressed with the fact that it is a wonderful game country. We were in the woods eighteen days, and in that time saw thirty moose, three deer, a bear and scores of partridges. Caribou are very plentiful further to the north and east, where there are extensive barrens. The waters are teeming with trout and salmon. Excellent guides are always procurable, and the visitor everywhere meets with such considerate and hospitable treatment that he always remembers New Brunswick and her people with much pleasure, and longs to return to her primeval forests and again try his luck with his rifle in one of the greatest hunting regions in the world.

GARDINER KLINE.

AMSTERDAM, N. Y.

Kipling's "Red Gods."

Log-Jams, Shingle-Bars, Canoe-Poles, Smoky Indians, and that Sort of Thing.

Editor *Forest and Stream*:

Since that genial member of the old guard of observing forest rangers, skillful anglers and accomplished writers, Charles Hallock, founded your sporting journal in 1873, I doubt if so much "spurious writing about angling and nature" has appeared in its columns as is contained in your issues of Sept. 26 over the signature L. F. Brown, and in that of Oct. 17, over the name R. W. Ashcroft. About Mr. Brown's critique on the two quatrains he quotes from Kipling's *Idyl*, "The Feet of the Young Men," all I shall now say is that in everything he condemns with all the confidence of ignorance, Kipling is right and Brown wrong, as every one who has the requisite knowledge and experience of forest life will perceive.

In your issue of Oct. 10, Manly Hardy, who writes from Brewer, Mo., in very courteous terms, endeavors to put Mr. Brown right. If B. is at bottom the clever and genial gentleman he is described by a common friend, I feel sure he will see and acknowledge the errors into which lack of experience on our Northern rivers and racing streams has led him. Anyone who has had that experience will recognize the essential truth of all that Mr. Hardy advances in defense of the *vraisemblance* of Kipling's wonderful word-pictures. The pleasure of reading Hardy's paper, with its intimate knowledge of forest life, will amply repay all sportsmen for the annoyance they felt at Brown's offensive dogmatism, and almost move them to thank him for introducing us to so keen an observer and so ardent a lover of nature as Mr. H. proves himself in every line of his letter.

In your issue of Oct. 17, R. W. Ashcroft, of your city, comes to the rescue of Mr. Brown, and shows himself a more pretentious critic than his friend. Why such incompetent writers as this man proves himself, will foolishly "rush in where angels fear to tread" and make an abortive attempt to criticise so experienced a woodsman as Mr. Hardy shows himself, is one of those "curiosities of literature" which, to quote my old friend Ned Sothern, "is one of these things that no fellow can understand." The whole of the two columns this writer perpetrates is, to use his own elegant diction, "such entire folderol as to make it laughable to real woodsmen," of whom he ignorantly supposes him to be a past master.

The Old Angler is now in his eighty-third year. Since he caught his first trout with a worm on a bent pin and a piece of yarn for a line, he has been familiar with most of the rivers and racing streams of eastern Canada; but those of northern New Brunswick, the St. John, the Tobique, the Restigouche and its affluents, the Nepisiguit, the Miramichi, its branches and their tributaries, the Bartibogue and Tabusintac on the southern side of Bay Chaleur; the Scrimac, the Nouvelle, the two Cascapédias and the Bonaventure on its northern side, have been familiar haunts since early manhood, and he says, without fear of contradiction by anyone who has camped out and canoed on these racing streams, that every feature painted in Kipling's lilting quatrains is to be seen on all of them. Any canoeist and camper on any of these

streams will recognize the "blackened timber," the "racing waters," the "raw-right-angled log-jam" at what seems to be the "end" of the water, whether seen from above or below the jam, making a raw spot in the sylvan scene. I doubt if any other five words in the English language can be combined to paint so true a picture as is presented to the mental vision of anyone who has ever seen a jam of logs. I am persuaded that neither Mr. Brown nor Mr. Ashcroft ever saw what I attempted to describe in a sketch of an outing on Grand Lake stream in the State of Maine, written forty years ago. Mr. Hardy and Mr. Ames will recognize the picture, badly as it is painted.

* * * "As it was useless to fish while the drive lasted, we spent an hour or two very pleasantly in watching the operations of a gang of men employed in breaking a small obstruction, which had formed below the fall, where the water pitches over a ledge into a long stretch of wild rapids. Above this ledge the stream is narrow and rapid, but the rise of water consequent on lifting the gates in the dam at the 'corporation house,' caused the stream to overflow this channel and spread over a rocky and rugged shore. To watch the action of the logs as the pressure of the water behind piled them up into all fantastic shapes, was most interesting and exciting. Sometimes logs would rear up on end, like restive horses, and then tumble over backward, sideways, or forward, as their weight and balance inclined. In their wild antics they would form all sorts of figures, from right angles with the logs against which they impinged to acute angles with the body of the jam, and every degree of obliquity with the water and the shore. At times a more or less perfect isosceles triangle would tremble in the air, while scalene triangles would form and vanish in a twinkling of the eye. A short turn in the stream, just above the ledge, offered every facility for the formation of a vast jam, which would be a serious matter for the drive, and the utmost activity was necessary to prevent this troublesome and dangerous occurrence. About a dozen men were busy as bees in a strange hive; they seemed to possess the gift of ubiquity, for they were everywhere at once, with keen eyes, steady feet and strong hands, pushing, prying and rolling with strong peavies the logs that grounded or caught against the rocks of the shore. Despite their strenuous exertions the nucleus of what might grow to be a very serious jam, had formed on the very verge of the pitch into the rapid, and unremitting exertions were made to prevent its growing, while several men took turns at the difficult task of cutting through the 'key-log' that held all the rest. This once divided, the obstruction would be removed, and the whole incipient jam, log by log, would tumble over the ledge and find ample room in the broader stream below. The difficulty extended only part way across the stream, commencing on the hither shore, and the object of the men was to guide the rapidly arriving logs past the outer edge of the jam and send them over the ledge through the narrow passage that was still open. Wonderful activity and daring courage were every instant exhibited. Sometimes a man would make a prodigious leap and alight upon a log that threatened to lodge; this would set it rolling in the water. With the skill of a rope dancer and the quickness of a practiced acrobat, this man would maintain his footing on the rolling log, guide it along the outer edge of the jam, and when it approached the pitch would spring from it to the one nearest and from that to the next, until he regained the shore. While these and various other daring, difficult and dangerous feats were being performed on all sides, one man was constantly wielding the ax, and the obstructing log was cut nearly half way through. This was on the innermost verge of the pitch, the log was nearly submerged, and as the only footing was on the log itself, the duty was not only difficult but full of danger, for the immense and growing pressure behind might at any moment break the log and precipitate the chopper, as well as the whole jam, into the boiling torrent below, where almost certain death awaited him. But, cool and self-possessed, as if they were cutting a back log for a Christmas fire, these men took their turns at the terrible task until the situation became extremely critical. But a few more strokes were needed when the foreman of the drive, Frank Waite, a slight, lithe young man with a mild, blue eye, looked first at the log, then at the mass behind it, as if calculating its weight and the momentum it would have when in motion; then seizing the ax himself he gave several vigorous strokes, and just as the log began to bend to the pressure, he leaped to the next above it, and made his way to shore over the moving mass, just as the whole body went tumbling over the ledge. All this took place in less time than I have spent in relating it, and it formed no small part of our morning's diversion." * * *

Had I possessed the genius of Kipling all this could have been conveyed to the experienced woodsman by the five words which the poet has so happily combined to make a picture in which neither Brown nor Ashcroft can recognize a salient feature, but with which both Hardy, of Brewer, and Ames, of Boston, Mass., are delighted, because their experience recognizes its truth to nature. Mr. Ashcroft says: "Kipling speaks of a log-jam as raw, using the word as synonymous with unfinished, and tells us that 'a log-jam is an aggregate of tree-trunk sections,' which, to the average reader, who knows nothing about saw-logs, conveys the idea that these sections may be made lengthwise, and then he treats us to a long paragraph about the beauty and finish of a tree-trunk, and quotes the following gush from Ruskin to show us that he saw it all in a jam of saw-logs, which are sections of tree-trunks! 'Nature has taken wonderful pains with the forms of trees, sculpturing them into exquisite variety of dint and dimple; rounding or hollowing them into contours which, for fineness, no human hand can follow; then she colors them, and their whole substance is full of hidden histories concealing wonders of structure, which, in all probability, are mysteries to the angels'; and all this to show us that Kipling in his blindness and ignorance of nature calls a log-jam raw—not in the sense of 'unfinished,' as Mr. Ashcroft ignorantly supposes—but in the sense of a raw spot

or wound in an otherwise beautiful scene. And, then, emulating Ruskin, he gives us the following gush about the logs in this jam: 'Texture of bark, anatomy of muscle beneath, reflected lights in recessed hollows, stains of mosses and lichens and wonderful delicacy of hues,' which poor Kipling could not see! Mr. Hardy tells us, and truly, too, that nothing of this kind can be seen in a log-jam, and Mr. Ames adds his testimony that no "wonderful study of hues—browns, umbers, faint pinks and purples, dull reds and yellows, silver of lichens and green and crimson of mosses—is to be found in a raw log-jam." In looking back over my own long experience by wood and stream, I conclude I must have been blind, for nothing approaching all this have I ever seen, either in a new or an old log-jam. Mr. Ashcroft concludes this paragraph of his unique criticism thus: "By similar reasoning the rough board sawn from that log, which is raw, should be called finished. As well call a steak cut from a quarter of beef finished." In the name of all the Gods at once—white, black and red—what has all the above "folderol" to do with logs in a jam? Kipling does not apply the word raw to a log. The raw thing in the landscape, as Kipling applied it, is the jam! Not "sensing" this, Mr. Ashcroft spreads himself thus: "If a log in the natural state is raw, so is a rainbow or a cloud, a wild flower or a star." And this is criticism as she is understood by these two sportsmen.

Mr. Ashcroft gives us a detailed itinerary of his friend's sporting experience, which extends from Vancouver Island to Nova Scotia, including the salmon and trout streams of Newfoundland, and then argues that "he should know just a trifle more than Kipling about log-jams and canoe-poles." Well, perhaps! But as Mr. Hardy justly observes, "the odd circumstance is that Kipling is right and Mr. Brown wrong on every point." This is corroborated by Mr. Ames, as it will be by every man familiar with woodcraft.

The "bar of sun-warmed shingle," which is a conspicuous feature on all our northern rivers, and the "click of shod canoe-poles" must recall pleasant memories to every sportsman who has lunched and smoked his brier-root on these bars, and in the pleasant breeze, which generally blows over them, has sought surcease from the black flies and sand flies or midges, which were the only drawbacks to the intense enjoyment of his surroundings. Had these critics ever been on one of Kipling's racing streams they would have seen that no "dirt, mud or alluvium" could form a bar on them. A stream that moves boulders of ten or fifteen tons hundreds of yards after a freshet, would make quick work of any bar formed of dirt, mud or alluvium, which, they tell us, is the only material of which bars are ever formed. The only bars they will find in our rivers are formed of shingle—water-worn stones—with coarse gravel and sand in the interstices, and even these seldom withstand the spring floods.

Yes, Mr. Ashcroft, Kipling's Indians used and still use "shod canoe-poles" when they could get the iron thimbles with which to shoe them, and every Indian worth his salt can do that. Your friend of forty years' experience could never have been on our waters. He could easily make that trip down the St. John's River, the Tabusintac and the Margaree without seeing an Indian or a birch canoe, but if he made "three summer outings in a canoe on Maine streams" of any volume, he must have had Indians and guides too poor to buy shoes for their poles, and so he did not hear the click. My own experience of sixty years on our rivers (twenty-two of which were on duty as a fishery officer), enables me to say that an unshod canoe-pole is the exception to the rule. In all that experience with the best canoe men, both white and red, that New Brunswick has produced, I never saw an ash or a maple canoe-pole; nor have I ever seen one made large in the middle and tapering toward each end. Nor did I ever see or hear of such a copper sleeve as Mr. Ashcroft's quotation from his friend describes. There never was such a thing seen in New Brunswick out of a museum, and I never heard of it being even there. As for the "click," Messrs. Brown and Ashcroft could never have read Charles Hallock's "Fishing Tourist," published as long ago as 1873, or they would know better than to write such dogmatic nonsense as their criticisms exhibit. At page 147, in his chapter on New Brunswick, this veteran woodsman and fine writer says: "It is marvelous with what untiring energy and pertinacious effort the Indians mount the long and wearisome rapids. Never pausing, seldom speaking, pushing steadily with synchronous stroke, the rhythmic click of their iron-shod poles upon the stony bottom seems to mark the time."

No doubt we ought to be thankful to these sponsors of sport and purists in poetry for telling us that "traces" are not wanted on racing streams; but Kipling knew that his smoky Indian could take him to wonderful lakes on all our rivers, where Mr. Brown's *bête noir*, the so-called "sea-trout"—are to be had of 6 to 8 pounds' weight; but the over-fed rascals will take neither fly nor worm at times, but may often be caught with a gyrating spoon or a spinning minnow. So, even in this small matter, Kipling has shown himself the best informed sportsman, and convicted his critics of ignorance.

"A silent, smoky Indian!" Here, in three words Kipling has painted a picture which any sportsman who has ever had a real Indian guide, will recognize with a thrill of delight, as I did when I first read it. Even now my old blood warms at the memories it conjures up. Certain I am that no other words in the language can recall so correct an idea of the Indian to one who has ever known him. Writing to me some time since, Mr. Hallock said: "Kipling is the only writer who has touched on the smoky Indian in their wood epics. Time and again I have spoken and written of the smoky Indian when relating my experiences. I can smell an Indian as far as I can Limburger cheese; and so can a mule or cayuse on the plains. Many times have they warned us of Indians by pointing ears in the direction of their approach. In addition to the tepee being always smoky, the women are generally tanning skins in the smoke of the wickiups, so that they always live in an atmosphere of smoke when at home."

The most unfortunate break both Brown and Ash-

croft have made in their ambitious attempts—the first to criticize Kipling, the second to show how much more proficient he is in woodlore than Mr. Hardy—is shown in their sneers at the "Couch of new-pulled hemlock." *De gustibus non est disputandum* is an old and wise saw, and as long as these critics speak for themselves no woodsman or sportsman will object. But when they tell us that campers do not sleep on a couch of hemlock boughs when they can get spruce; they simply show how limited has been their experience. Mr. Hardy tells the exact truth when he says: "No one but a greenhorn ever uses spruce boughs when he can get anything better, and every other evergreen is better." Fir is softer and smoother; cedar comes next, then hemlock, then pine, and when these are not easily got the old hand must put up with spruce. For myself I prefer a foundation of hemlock boughs topped off with cedar, and whoever will try this couch will have no other while he is in the woods. Mr. Ashcroft calls all this "balderdash," and informs us that "the real sportsman sleeps under his canoe, in a tent, cabin, shack or lean-to." Well, I have slept in all these and also "with my back to the sod and my face to the stars"; if the night was fine I preferred this, as Kipling appears to do, for which I like him, for he also loves "to get near to the great heart of nature."

Let me say that you cannot better please "true sportsmen than to print again the three quatrains; and let me ask if any of your numerous readers can refer me to any other twelve lines of verse or prose in the whole range of English or American literature that paint so many, so true and so vivid pictures, and make the woodsman and the sportsman hear the Red Gods calling them to their haunts with such persuasive tones that nothing but sheer inability to leave their duties prevents them from yielding to the voices of the Charmers. Listen to them:

"Who hath smelt wood-smoke at twilight? Who hath heard the birch-log burning?

Who is quick to hear the voices of the night?
Let him follow with the others, for the young men's feet are turning

To the camps of known desire and proved delight.

"Do you know the blackened timber? Do you know that racing stream,

With the raw, right-angled log-jam at the end,
And the bar of sun-warmed shingle, where a man may bask and dream,

To the click of shod canoe-poles round the bend?

It is there that we are going with our rods and reels and traces,
To a silent, smoky Indian that we know—

To a couch of new-pulled hemlock, with the starlight on our faces,
For the Red Gods call us out, and we must go."

In concluding for the present I tender hearty thanks to Manly Hardy, of Brewer, and C. H. Ames, of Boston, Mass., for coming to the rescue of genuine woodcraft, and for defending the accuracy of those word-painted pictures which raise in all sportsmen who know and love their cult, that longon to gon a fissinge, which tells him the Red Gods are calling on their votaries.

THE OLD ANGLER.

Sussex, N. B., Oct. 19.

Editor Forest and Stream:

My sense of humor leads me to humbly thank you and the good sportsmen who have locked horns over Kipling's "Red Gods" lines. I especially enjoyed Mr. Ashcroft's assertion that a log-jam is "an aggregation of tree-trunk sections," and Dixmont's retort that a log-house is a log-jam!

May not this thought be the key-log to the jam in your columns? If a log-house whose logs were hewn should be stranded in a "racing stream," it certainly would make a log-jam that was "raw" and "right-angled." May not Kipling have seen such a house, and meant that in his lines?

F. J. HOYLE.

PELHAM MANOR, N. Y., Oct. 12.

Editor Forest and Stream:

This Kipling controversy has been very interesting to me as illustrative of how men's minds and powers of observation vary. For a man who knows so little comparatively about the subject, it does seem a little like "butting in" for me to add my say before the blue pencil of the editor gets in its work and scores the incident as closed.

I can testify to there being bars of shingle up in Maine, and other places as well, and I have lain upon them and basked in the warm September sun and have enjoyed it.

I have seen log-jams—some that have been unjammed by dynamite—and of all the "raw," broken, splintered, pounded and maimed things is a jam made up of logs that have fought every inch of their way over rapids and amid rocks and boulders, only to become entangled into one inextricable mass at a gorge or bend in the stream. I think the pounded and frayed end of a log almost wholly stripped of its bark is a pretty "raw" looking proposition compared with the freshly hewn log, covered with bark and green with emerald moss. So far the "shingle bar" and "raw" logs appeal to me as correct. As to the angularity of the log-jam I can only say that as a geometric proposition in angles the log-jam "takes the cake." We get all kinds in such a melee of logs—rectangular, obtuse, and principally acute. So, as an angular proposition, the log-jam is a success to my way of thinking.

The iron-shod canoe-poles are all right, too. River men working in and around logs on a deep stream sometimes use other means of traveling than on the floating logs themselves—to wit, boats or bateaux. The iron-shod pike-pole, fourteen to sixteen feet long and about 1½ inches in diameter, is the mainstay of the river man. That in manipulating a boat, he should use his pike-pole in preference to the oars or a paddle I can readily understand. That it, when used, would make a "click" or ringing noise when coming in contact with the stony bottom seems but natural to me. As to spruce or hemlock boughs for one's bed, there may be a distinction and a difference, but I have been so tired after my tramps in the woods and days on the streams that when I have lain me down to rest I have had no spirit of contention or dis-

mination left in me to berate my pride for using hemlock instead of spruce—Morpheus has settled the question on the spot, by bringing peace and quiet and refreshing sleep.

They do things differently in different parts of the country, and I do not think Mr. Brown fully considered the fact or he would not have written so critically of me as he has done.

Kipling certainly is an observer, and I think in this respect he certainly has writ as he saw and heard.

Where his Red Gods come in I am at somewhat of a loss to say; but poets are entitled to license, and on this point I am perfectly willing to bow my head to the Red Gods, be what they may, considering that he has hit the life-size fairly and squarely as to other things.

CHARLES CRISTADORO.

Look Out for a Long Cold Winter.

THOSE of our esteemed veterans and pioneers of the silvered State, especially those who are indigenous to marsh country along the west shores of Lake Erie, do not dodging the wet spells and stray shot from careless duck hunters, are devoting the later October days to a conservative forecast of the future with reference to quality and quantity of weather which is in store for those who are to be out of doors from now on until spring, or have the wherewith to meet the coal dealer with a bold front and a full wallet and stay inside. There is, as usual, some diversity of opinion on the subject, depending much upon the kind of "signs" that are utilized for the purpose. So far as my close observation goes, the signs on the sun cut no figure at all with the genuine old weather-guided weather prophet, if, indeed, he is aware that there are any spots on that blazing old swirler. That he banks on principally is the musquash, and his comparisons in the fall; the crop of nuts and acorns, and the activity of the 'coon and squirrel in gathering the same for future reference. My acquaintance with this sort of forecasters leads me to the conclusion that as around reliable prognosticators they can give the Government paid officials all kinds of odds and win out with their hands tied behind them. There is my old friend Xavier Francis Mouchoir, who resides in the fastnesses of the "ma'sh," for instance; he *knows*—and it is like flying in the face of fate to go contrary to what he says in regard to weather. He has lived in the locality thus indefinitely alluded to so long that he knows every muskrat by sight, and is on speaking terms with all the other mammals whose acquaintance is of any account whatever. Whether Xavier has, as has been surmised, any means of communicating with these families more intimate than those of mere casual intercourse, and learns from them secrets and information perfectly authentic in regard to the seasons and atmospheric phenomena generally, I am at this time unable to state; in fact, I dislike to betray confidences reposed in me by trusting friends. Let that matter pass for the present. What we want to know just now is, are we, or are we not, likely to be thrown headlong into the devouring maws of the anthracite, bituminous and other forms of omnivorous coal barons for a longer and more disastrous period than heretofore, and whether is the man who can tell us, and does.

"Wall, seh, I was goin' to tell you somethin', mah fren'. 'Een you was saw fiel' corn inside of it, dat tick, heavy sk—tick, tick, lak bundle straw, you mus' mak' plenty warm places for you' cattle, and plenty wood for you' fire-place, dat tam we goin' see planty col' winter—planty snow. It was dat kan o' corn husk we see dis year; also when you was see beeg, beeg piles hack'ry nut an' hacorn made wood, an' many, many leetle squirrel ketch 'em up 'n' hide 'em een dare nes', den you look out; dat was w'at we see dis year. Also, mah fren', w'en you was see dat corn apple full, full dare blossom', and full, full o' dare apple, too, you mus' not t'ink we goin' have hopen winter; ef you do, you goin' git lef', sure. Also w'en you was look an' see muskrat mak' hees house beeg, beeg 'n' tick, den you want bank up you' house, house, and mak' planty split wood for hol' woman to make fire. Wall, mah fren', we was goin' see hall dese t'ings dis year, hevvy one. You wait—you see."

That's enough for me. I'm buying my winter fuel right now. I have known Xavier Francis for forty-seven eventful and prosperous years, and he has hit the bullseye every time. So when I get to the month of September, October and I detach those months from my beautiful Winchester calendar, I am looking around for Xavier. It has happened once or twice that, owing either to some miscalculation on the part of the muskrats and of the geese in their flight, that they have been pinched, just as we have seen robins in the spring look very sorry at they came, and appear to be in doubt whether they could go back or stick it out, but this is not the fault of Xavier. This year he says so emphatically that we are going to have old Boreas with us early and late, and all sorts of things doing that I feel it my duty to utter warning to lazy, shiftless farmers and the ten-cent restaurants to look a leetle outd already.

FRANK HEYWOOD.

When off duty, Prof. Richards, of Yale, enjoys a joke, and his pupils often come to him when they have heard a new one. He adds to the fun sometimes with a witticism of his own. Such was the case when one of the students perpetrated the following antiquity: "Professor, wouldn't you like a good receipt for catching rabbits?" "Why yes," replied the professor. "What is it?" "Well, you crouch down behind a thick stone wall and make a noise like a turnip," answered the youth, giggling in ecstasy. Quick as a flash came the reply: "Oh, better way than that would be for you to go and sit quietly in a bed of cabbage heads and look natural."—Springfield Republican.

A Westerner was strolling about Battery Park, Manhattan, when he espied the Aquarium.

"What is that building?" he inquired of a newsboy.

"Dat's de fish t' eater," was the reply.—Ex.

Natural History.

Zoological Society's New Animals.

THE Hamburg-American liner Pretoria, which reached port the other day, brought to this country for the New York Zoological Society one of the most valuable consignments of animals the Society has ever imported. It comprises, in fact, almost the entire collection planned for the new antelope house in the Zoological Park. The new arrivals found comfortable quarters immediately upon their arrival in the now almost completed antelope house, which will be formally thrown open to the public on November 10.

The collection comprises more than twenty-five specimens from Africa, Asia and South America, and includes two giraffes, many rare antelopes and a complete collection of the cameloid animals of South America—llamas, alpacas, vicunas and guanacos. More than \$14,000 was expended in getting the African and Asiatic specimens in the collection. They were brought together by Karl Hagenbeck, who declares the collection to be the equal of any other in the world. The South American animals were given by Robert S. Brewster, of this city. These animals are now quartered in a special building erected for them on a wooded knoll near the southwest entrance of the park.

According to Director Hornaday, the most important animals in the lot, both as to appearance and value, are the giraffes. They are splendid specimens, the female ten feet and the male eleven feet high, finely mottled and sleek. They were taken in German East Africa. They are installed in a special room in the antelope house, twenty feet high, twenty-three feet long and nineteen feet wide.

"The giraffe," said Mr. Hornaday, "is one of the most delicate of animals, and one of the hardest to keep in captivity. Every effort will be made in the way of furnishing adaptable quarters and giving the greatest care to keep the two new arrivals trim and fit for exhibition. There are now only about twenty-five giraffes in the various zoological gardens in the world, and while not as scarce as the big rhinoceros, they are rapidly becoming depleted in number. The only other giraffes that I know of at present on this side of the ocean is the one owned by the Barnum, Bailey & Co. Circus and the two owned by the Ringling Bros.' Circus. A local New York dealer has two in his possession just now, and these, I understand, will soon be acquired by the aforementioned circuses.

"The manner in which the giraffes are caught is by huntsmen, mounted on fleet-footed horses that can outpace the younger giraffes, the lasso being the means of their capture. Full grown giraffes are rarely caught. The young giraffes when captured average from one to three months old, and from five to six feet high. When full grown they command from twenty-five hundred to five thousand dollars each. Our two new giraffes are about two and a half years old, and with good luck and good management they may be on exhibition at the park for the next twenty-five or thirty years, which is the giraffe's normal length of life.

"When caught the giraffes are, as a rule, shipped direct to London or Antwerp, where they have frequently been bred in captivity. If fortune favors us, it may be that we will have a third specimen in our collection before the year rolls round."

The two new giraffes arrived at the park in splendid condition, and without any mishap, and are remarkably fine specimens. They are sorrel in color, and mottled with dark chestnut spots. They appear to have taken kindly to their surroundings, and give every indication that they will continue to thrive. Keeper Forester says that they are daily fed with a bucket apiece of warm milk, the finest clover hay, and all sorts of vegetables chopped up and mixed in bran. By spreading their forelegs the lanky animals manage, when necessary, to eat from the ground, but their food is usually placed for them in a manger on a level with their heads. While several attempts of a more or less unsuccessful nature have been made in Europe to break captive giraffes to harness, no such an attempt will be made with the new animals at the Zoological Park. Keeper Forester declares that the giraffes are about the most stupid animals of any sort that he has ever taken care of, requiring almost constant attention to see that they do not injure themselves. They bump their long necks and fragile legs about in the most alarming manner, he says, and scarcely appear to know enough to get out of their own way. They appear to be very tame, however, freely feeding out of any visitor's hand.

Of the antelopes an eland bull from Central East Africa, and weighing over 2,000 pounds, stands in a class by himself. The eland is the largest of all antelopes, and this particular bull is one of the largest of his kind. When in condition, and he has forgotten the terrors of his ocean trip, it is expected that he will tip the beam at 3,000 pounds. Mr. Hornaday says that these mammoth antelopes, once abundant in Africa, are now very rare. The present specimen is said to be the only one that has been sold by anybody in the last four years. It was secured by Carl Hagenbeck from the collection of the Duke of Bedford, who enjoys the distinction of owning about a dozen of these rare animals.

The newly arrived big eland is in color very much like an Alderney cow, having almost straight horns about two feet in length. The forehead is covered with a mass of fluffy brown hair tapering off in color toward the nose to deep black, which gives the animal a most striking appearance.

Then there is a pair of gnu, with white whiskers, zoologically and more politely known as white bearded gnu. Also there are two white-tailed gnu. They represent a species of African antelope now almost extinct. The white-tailed gnu frequent the Boer country along the Orange River. In appearance they strongly resemble a horned horse, by which name they were some years ago commonly called. About three feet and a half high, their hindquarters and trim, delicate legs strongly resem-

ble those of a thoroughbred horse. Rising above the hogged mane the horns sweep out straight from the head and then curl in again. Keeper Forester says that they are very wild and that no one cares to venture into their so-called cage for fear of bodily injury. The gnus are being rapidly killed off by the Boers, who say that they mingle with their cattle on the ranges and frequently injure them with their sharp, murderous-looking horns.

The blesbok, meaning blazed antelope, which is represented in the new collection by one adult specimen, is another kind of antelope which cannot find any of its kind for company without looking over large parts of Africa. In color the blesbok is a bright bay shading to darker about the sides, with face and legs blazed with white. There is a beatrix antelope from Arabia, and an addax, which, before it was caught, spent its young life in cavorting around on the burning sands of the Sahara. Both of these are as beautiful as they are rare. The body of the beatrix antelope is pure white, shading off to brown about the legs, and with long horns curled slightly back.

The Zoological Park now has on exhibition a herd of sixteen American elk, one Roosevelt deer, two alтай wapiti, and three Sambar deer. What, with the new consignment of animals, the collection is one that will surely be of great interest to the public.

Animals of Pennsylvania and New Jersey.

(Concluded from page 276.)

TO THE general account of the elk in Pennsylvania, Mr. Rhoads adds a more detailed consideration in which he takes up different sections of the State and for northwestern Pennsylvania the different counties. From this it appears that in many of the northwestern counties elk were common enough during the decade between 1830 and 1840; that in Elk county an elk was killed by a man named Gaylord in 1862; in Potter county one is reported to have been killed in 1862 or 1863. In New Jersey there seems to be no modern record at all, though the old histories refer to elks as existing in various points, and their remains are not uncommon.

The buffalo, as shown by Dr. Allen, were found in western Pennsylvania, but it was long ago. Their remains, together with those of closely similar species, have been found in many localities.

The beaver has been reintroduced in Pennsylvania though the source of the supply is unknown, except that a number of years ago some beaver escaped from the preserve of Mr. Rutherford Stuyvesant's game preserve at Allamuchy. It had long been extinct. However, there is a considerable colony on the farm of Judge Edinger, near Stroudsburg, in Monroe county, Pa. Here they have built dams and established themselves, and fortunately Judge Edinger is greatly interested in them, and will protect them so long as they are on his property.

In New Jersey, as first shown in an article published in the FOREST AND STREAM in August, 1900, beaver have established themselves. This fact was first made public by Mr. J. Von Lengerke, who states that there are a number of localities where the beaver may be found, especially in Sussex county. With protection, there is no reason why in both these States the beaver should not do well. The damage which it does along the streams is trifling.

Of the southeastern muskrat Mr. Rhoads says: "This animal is rightly regarded as a nuisance by those who have the care or ownership of artificial water embankments, because of its persistent burrowing. Owing to its aquatic habits, wariness and prolific breeding, it defies extermination in the most populous regions. Were it not for the value of its fur and meat, which latter is largely consumed by those who trap it, and by the negroes and Italians, it would speedily become a pest in some districts. Some of the canal companies of Pennsylvania and New Jersey give a bounty on the scalps of muskrats taken on their property, besides employing regular trappers to hunt them the year around. In some of the large reclaimed tide marshes of Salem and Cumberland counties, N. J., the trapping of these animals for fur is so profitable that the larger owners of these dyked lands lease the privilege of trapping upon them for considerable sums of money yearly. An examination of the reports of fur dealers in Pennsylvania and New Jersey shows that muskrat furs number five times as many as all other kinds of fur put together, with an aggregate value of about double that of all the others. The food of the muskrat is rarely secured at the expense of man, being confined largely to aquatic vegetation of little use in agriculture. I have known one in severe winter weather to travel overland through deep snow to a corn crib after grain. They damage some grain and vegetables, but the aggregate amount is trifling. They have been accused of killing fish, and have a habit of gathering mussels from the mud and piling them upon the logs and rocks to die. The shell thus opens and the contents are devoured by some animal, presumably the rat, though I have never seen them do it. No doubt minks, 'coons, and foxes, etc., participate in those feasts. The muskrat, like the beaver, has two distinct classes of homes, the earth burrow and the house or lodge in either of which they live, but only rear their young in the former. Along swiftly flowing streams or lakes without extensive marshy tracts the first kind of home is alone practicable, but in tide-water and in open swampy areas which are always submerged and inaccessible except by wading or boat, the rats pile up heaps of grass, leaves, mud and sticks to the height of two or three feet and six feet in diameter, making an oven-shaped chamber near the top, and entering it from below by two or three waterways leading to the distant bed of the stream. This home generally overtops the highest tide and flood, and is often so bulky as to fill a cart.

Among the mountains of Pennsylvania the panther was formerly not rare, but thirty or forty years ago it had become scarce, and perhaps the last one killed was in Clearfield and Suffolk counties in December, 1871. This animal was treed by a bulldog, and on the day following a second was tracked to a swamp near Big Run. When the bulldog was put on the track it drove the panther

under a rock nearby, but the dog going in after it dragged it out. It finally broke away from him and took refuge on a rock, where it remained until the hunter killed it. In Lycoming county there is an inferential tradition that a panther killed a man. The two specimens killed by Mr. Hastings, a male and a female, are said to have measured, the female 8 feet; the male, 9 feet. On the other hand, we know that panthers killed by Mr. Roosevelt in Colorado averaged about 72 inches, the largest male being 8 feet long; the largest female 7 feet long.

The Canada lynx has been taken in Pennsylvania in quite recent years, though it was probably never a common species in Pennsylvania. Specimens taken within the State have been examined by the author, and one is reported as having been killed in Lycoming county in 1896.

The wildcat is probably increasing in Pennsylvania, but scarce in New Jersey.

Both the red and gray foxes are abundant in both States.

Of the wolf, Mr. Rhoads has much to say, and he believes that in Pennsylvania it has been exterminated only within a few years, although in New Jersey the last wolves were probably seen in the early part of the last century. Pennsylvania accounts seem to indicate that a remnant of the typical wolf of the Allegheny may still exist in some of the mountains of the State. In Clearfield county a wolf is reported to have been killed by a man with a club the winter of 1891-92, and wolves have been seen and their tracks have been seen at different points in recent years. But these are not records to which the scientific observer would care to tie himself.

There seems to be evidence, however, that wolves still exist in Somerset and Westmoreland counties in Pennsylvania, and that at least one wolf was captured there perhaps in 1897. Wolves have been killed also in Tioga county, but they were western prairie wolves purchased from a circus for 50 cents apiece, and then killed and \$10 bounty collected on each one. The date of the extermination of the wolf in New Jersey is a long way back.

The wolverine, known also as glutton, and recently more or less discussed as carcajou, no doubt formerly occurred in Pennsylvania and New Jersey, but must have always been rare in recent years. There is testimony, however, of wolverines having been captured in Pennsylvania in the latter half of the nineteenth century, but only on one or two occasions.

The fisher or black cat may still occasionally be found in the rough mountains of Pennsylvania, and Mr. Rhoads has secured many records of its capture in recent years.

The black bear, of course, is still occasionally found in the territory under consideration, and some observers in 1900 report them as increasing.

Among the introduced species mentioned in Mr. Rhoads' list are Franklin's spermophile from the west, the beaver, and possibly the western timber wolf. There is a long list of extinct mammals.

Mr. Rhoads' admirable work is one which should be not only in every public library in Pennsylvania and New Jersey, but in the library of every man resident in those States who is able to afford the luxury of a few books. It would be hard to imagine a volume which should have a greater interest for each resident of these States than this one, and indeed it is besides of much practical use to the farmer, and the man who spends much of his time out of doors. The volume is heartily to be commended. The cloth bound book sells for \$2.50.

The Apple Bird.

Editor Forest and Stream:

May I thank Forked Deer through you for his last contribution to the "apple-bird" mystery? He has certainly proved to my satisfaction that he got the right bird, and it is no doubt my own fault that I cannot name it from his description, but that light stripe the length of the under parts is beyond my experience in woodpeckers. However, one of the first things to learn in science is that there is a great deal that we have not seen ourselves, and one of the next (which I set aside because I was not afraid to show what I didn't know myself if I could find out what someone else did know about the "apple-bird"), is "not to guess without you know." There can be practically no doubt about this bird, and yet I am not acquainted with any plumage of the Lewis's woodpecker which answers to the description.

If someone could settle the point authoritatively it would give me one more additional good point about the woodpeckers, for all the information that Forked Deer has given about the habits of the bird, including its eating green corn, bears the mark of unimpeachable authenticity.

There are notes upon notes published in natural history, some manifestly bogus, some as patently careless, some written by those who have had neither the information nor the experience to enable them to make a true record, so that they put together a tissue of well-meaning blunders; but I wonder sometimes if those who really do have the ability to tell the truth clearly and who are good enough to record their observations for the public service, know how quickly their records are sorted out from the trash and taken in charge by the specialist in some department. There is always someone who is waiting for just that bit of information.

FANNIE HARDY ECKSTORM.

An Albino Squirrel.

DECORAH, Iowa, Oct. 14.—A snow white female squirrel was captured here last Sunday without injury. She is a most beautiful animal, almost full grown, young, pure white, with pink eyes. Understanding that FOREST AND STREAM had a standing offer for animals of the albino persuasion, will you kindly write me what, if any, price or prices you hold out for same, or refer me to a fancier who is reliable, as this is a chance for a handsome pet?

M. A. HARMON.

[We do not give prizes for albino specimens.]

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the book.

American Game Brds.

III.—The Quail.

FROM the personal point of view, each one generally has his own preference in respect to the bird which he prefers to shoot to secure the greatest pleasure, and this preference in turn determines the shooter's opinion that such bird is therefore the best of all birds for the purposes of sport. Thus one prefers ducks, and not considering that his own personal idiosyncrasies, or greater success, or habit and long association, or what not, may have much to do with his preference, he solemnly avows that duck shooting is the best of all shooting. And so with him whose choice of sport is the shooting of some other bird—that bird is sure to be exalted above all others.

But from the standpoint of the greatest good to the greatest number, quail shooting for many reasons is the best of all shooting. It is a kind which affords such mixed shooting—open and cover, slow and swift—that parts can be found to meet the skill and fancy of all, be the former true or great, and the latter fastidious.

There is much of the open quail shooting which is not so difficult as to dishearten him of moderate skill, while, on the other hand, shooting in cover tests the skill of the most expert sportsman. And again, taken all in all, whether in open or cover, the quail shooter of good average skill can compass a good showing in results, having the consequent pleasure which comes from reasonable success.

In this connection, it may not be amiss to maintain that a certain degree of success is essential to the shooter's pleasure. Many writers deprecate the consideration of the bag, treating it as an irrelevant, gross incident, so dominated by the beauties of nature and the ethics of shooting in the abstract that it should be mentioned in hushed tones, or viewed with eyes askance. The beautiful and the useful of sport should go hand in hand. Each is a part of the great whole, and as such should be equal factors in sportsmanship. To the sentimental, which ennobs and adorns the useful of life, there must be added the material and the practical. To the shooter there must be reward for his efforts. It has often been said that it is not all of shooting to shoot, nor all of fishing to fish, forgetting the converse that, all of shooting or fishing being absent, there is no shooting nor fishing at all.

As to quail shooting in respect to quantity, there is more of it than there is of any other kind of shooting, hence each shooter can better satisfy his longings for sport if it be measured by the possibilities of the bag or the number of opportunities offered. And there is also more of it when measured by the matter of time, for it extends through a season of about five months, taking it as it is in the North and the South. Thus the man whose business cares leave him but a few days for shooting, and these at no definite time, has more possibilities of sport on quail than on any other bird.

But the very abundance of the quail seems to have checked the proper appreciation of it. Not that it is treated with neglect, but there seems to be a lack of the enthusiasm and lavish use of the superlatives, as is often to be noted when writers are discoursing on the ruffed grouse, or woodcock, etc. Nevertheless, it is not uncommon to have a keen relish for what is rare, even if it be not of the best, while the good may be so common as to escape notice.

The quail is more uniformly and widely distributed throughout the United States than is any other game bird. Its habitat generally comprises both open and cover (though whole districts are exceptions, as will be touched on later), thus, besides giving the sportsman a mixed style of shooting, is added the charm of constant variety and the testing of the sportsman's skill in woodcraft. It differs from the ruffed grouse, whose habitat is in the woods, a much smaller section relatively. The ruffed grouse is strictly a bird of the forest. It in practical shooting never can be the bird of the people, though it be a bird whose qualities are equal to testing the skill of the best sportsmen.

All works on natural history, so far as I know, teach that the quail's habitat comprises conjointly both open and cover, and while such is true in a general way, there are important exceptions to it—so much so that a work devoted to the habits and habitat of the quail as they are in one locality might be distinctly erroneous if applied to the quail of some other locality. In

this respect it differs from the prairie chicken and the ruffed grouse; for of the one it may be said without qualification, that it is a bird of the prairie, of the other that it is a bird of the woods. Such saying of them will be found to be true where these birds may be found.

The quail thrives wherever it can obtain a food supply, in open or cover. It readily adjusts its habitat according to the dominating circumstances of food and cover, whether it be in prairie or woods, or a country comprising both open and cover.

In the country north of the Ohio and east of the Mississippi rivers, it frequents the open fields largely, preferring such as have a good food supply, with hedges or old walls and fences fringed with brush, or nearby woods and thickets to which it can run or fly for shelter or safety. In such sections it rarely goes far into the woods, preferring to skirt along the outer edges of them merely for protection and shelter. The hawks are its deadly enemies and it needs ever to be alert in avoiding them.

Flights.

Often the flight of the quail when fleeing is a compromise between cover and open, so that it is never so easy a prey to mediocre skill as is the bird of the open, the prairie chicken, slow of wing, little given to strategy in evading its enemies, and trusting for safety to flight, which is neither swift in itself nor puzzling to the shooter.

As the ruffed grouse is so discouraging to most of shooters consequent to being beyond their skill, patience or endurance, so the prairie chicken, being at the other extreme, soon dulls the sportsman's interest from the monotony of the sport which is afforded, and the ease with which the bird may be killed. The chief merit of chicken shooting consists in that it is summer shooting, coming at a time when the zest of the sportsman is keen from months of deprivation from sport with dog and gun, and when the outing has the charm of the prairie in its most beautiful adorning. There is a monotonous sameness to chicken flights which begin and end in the open, thus lacking the variety which pervades the sport when solving flights in cover and open wherein the trees and brush force the shooter to time his shots and to take advantage quickly of the opportunities offered. Such combinations of obstructions and flights, curves and straight lines, require a style of shooting differing in every particular from the spiritless and calculating method so commonly practiced by the methodical chicken shooter. When the chicken becomes very wild, as it does late in the season, it flushes at long ranges and is difficult to shoot. Shooting then is a test of the gun quite as much as it is of the shooter. However, chicken shooting is at a time when nearly all sportsmen have finished their shooting on the prairie, hence late, it is not worthy of much consideration as a sport of the many.

Roosts and Shooting.

The quail oftenest roosts in the open fields, where there is at least a few inches growth of grass, stubble or weeds for concealment, and it uses the same place many times if not constantly disturbed. This is indicated by the grass or other vegetation being beaten down in the roost, the small circular opening, about 2 feet in diameter, and the pile of droppings in the center of it.

The birds huddle on the ground, bunched up close in a circular form with their heads outside; thus all face toward the outer circumference of the circle which cannot be approached without coming to the view of some bird. This arrangement is said to provide admirably for the safety of the whole. In theory it seems a wise arrangement; in practice it works very faulty, since they often fly reluctantly when they have comfortably adjusted themselves for a night's rest. The pointer or setter also can draw very close to them then, generally doing it with greater precision than when they are more scattered about, the evening hours being more favorable for stronger scent and accurate pursuit. Were not dogs trained to such stanchness as is required in shooting, they could easily, at such juncture, spring in and capture, as indeed some partially trained dogs will do under the circumstances.

In the States of greatest bird abundance, as in Arkansas, Mississippi, etc., and where there are many ragweed fields, in them very destructive shooting often takes place near the twilight hours, when the birds have settled themselves for their slumbers. When the dog points the bevy the shooter fixes himself at the proper distance from the roost to obtain the best scatter of the shot. Then the huddled birds, being flushed, swarm up loosely together for 3 or 4 feet then the shooter takes a snapshot at them, and often does nearly as much consequent damage as if he had potted them on the ground. It is hardly necessary to add that this practice is disapproved by all true sportsmen.

In the Prairie Region.

In Minnesota, Dakota, Nebraska, Kansas and other prairie States, the quail readily adapts itself to the local peculiarities of the different sections, utilizing such slight advantages as may offer, as hedges, fences, the cover with which most streams are fringed, high weeds, etc., in this respect the habitat of one bevy being quite distinct from that of another even in the same immediate locality.

Its Enemies.

The quail sadly needs cover for its protection, its destroyers being both of air and earth—hawks, foxes, dogs, etc.—and the eggs, too, fall a prey to the rapacious appetites of some of its enemies. In the South the cur dogs of the negroes—every family owning one or more, all kept in a kind of half-furnished condition—crowl through the fields seeking for food, they are the very worst of egg destroyers. Were it not so sturdy and prolific, its fate would be swift and extermination certain.

The negro dogs seem to be almost omnivorous. In the fall they may be seen making daily visits to some persimmon tree, under which they eat the fallen fruit with great apparent relish. The ones which have some claim to blood are not averse to making a meal in the cornfield on corn when it is in the milky stage. With such rapacious enemies to contend against, the destruction of the quail must be great, but in addition to all that, many by man are trapped and netted, methods which destroy whole bevies at a time.

Quail of the Woodland.

But to return to the matter of the quail's habitat—in certain parts of the South, as in the oak woods in sections of Alabama, Texas, Arkansas, or in the pine woods of Louisiana, Mississippi, etc., the quail may live wholly in the woods, food, always a first consideration, being therein secured in abundance.

In cover, some of the shooting is easy and some of it very difficult, though hardly ranking in difficulty with ruffed grouse shooting. The quail is neither so wary nor so wild as the ruffed grouse. Shooting in some parts of the pine woods is almost as easy shooting as shooting in the open, the ground being bare except for its covering of dry pine needles. The smooth trunks of the pine trees standing several yards apart and free from limbs upward of 30 or 40 feet, offer no serious obstacle to the shooting. In other sections of the pine woods, where the growth of the trees is more stunted and the limbs grow from near the ground up, the difficulty of the shooting is second to none, and in some sections is almost prohibitive.

Prairie Quail.

Again, there are sections wherein the quail live on the open prairie, as in parts of Arkansas, and being strictly open shooting, it much resembles chicken shooting, excepting the difference in the size and speed of the two birds, the quail being much the quicker to get away at the start. The quail makes its flight in the open prairie, lighting near any little bit of shrubbery, be it no more than a bush or two of sumach, which, by the way, grows here and there on the prairie in Arkansas. In the woods, when pursued, it frequently takes to the tree tops for safety, where it is hidden indeed. On the warm days, or when there has been a long spell of pleasant weather, it is far less wild than when the weather has been stormy, or when there has been a sudden change from warm to cold. Such changes add to the difficulties of the shooting immeasurably.

Northern Shooting.

In the North the quail makes its habitat where some buckwheat or other grain field is available for a food supply. It so arranges its haunts that it has some cover within easy flight in the densest part of which it seeks safety when flushed, not refusing the heavily timbered swamps if too much persecuted by the shooter. In such places it has an excellent chance from pursuit or to foil its pursuer by simply running away, or, if pressed to take flight, it has many chances to escape, owing to the difficulty of shooting accurately in the dense cover.

New England shooting is the most difficult of all quail shooting, excepting perhaps shooting in the dense pines of some sections of the South. Then to have any satisfactory success, the scattered birds must be diligently followed and sought in the thickets, be they ever so dense. In this respect it differs from shooting in the sections of more abundance, where such close attention to the scattered birds is unnecessary either for sport or the interest of the bag.

In the South, where there is an abundance of birds comparatively, the sportsman rarely tarries with a bevy which gives him any special difficulty. It is much easier and more satisfactory to go on and seek more birds. For this reason, even under favorable opportunity, the scattered birds are never, as a rule, hunted

till the last one is flushed, and flushed again when it is possible, as in the North.

In New England buckwheat fields are the quails' choicest resorts for food, and any adjacent brush, or long grass of swamp or upland, or the skirts of woods, afford the shelter and protection that they need or seek. No doubt the birds become wilder in the North than in the South, for first of all the inclement weather of the North tends to make them so, and there is a much more relentless pursuit of them by the shooter. The birds being scarce, after the bevy is scattered the search continues while there is a hope of finding a single remaining one, and if success with them has been unsatisfactory the shooter may return later to catch them, when they are whistling to each other in their attempts to come together as a bevy.

Local Quail Dogs.

In the broad plantations of Mississippi, Alabama, Tennessee, Arkansas, etc., a dog of reasonably wide range is necessary, much wider than would be either desirable or useful in New England or similar sections in respect to cover; for there is much of the country in the South open and cover which everywhere affords a bountiful food supply, and therefore, the birds are to be found in the most unexpected places. The cover and cultivated fields of the South do not aid the hunter's judgment as to quail haunts to the degree that they do in New England shooting. In the latter place there are comparatively few areas in which the birds can get both food and cover together, or even food alone, and the sportsman soon learns to distinguish the favorable places. In the South, in cover and open, there is food in abundance everywhere. There are vast fields, some of which are overgrown with sedge grass, others with weeds, with fields of cotton and corn interspersed, any part of which is a fit habitat for the birds; thus the dog working out such ground in the South can, as a rule, beat out all parts of it with probable success. In the more open grounds of the South, the dog can be seen at long distances, so that a wide range is not detrimental in itself, providing that the dog is really working to the gun and not self-hunting, or semi-self-hunting.

As to the manner in which the dog should hunt, no hard and fast rule can be laid down which would apply to all sections.

Whatever may be the habitat of the quail, it learns to make the most of its surroundings in promoting its own safety and interests. It learns whether it is better to fly or run in evading its pursuer, and the best strategy to attain that end. If good cover is conveniently near, it may trust to its wings at once for safety, and to its legs and wings if followed into the cover.

If the country is open or with narrow and insufficient cover, as in parts of Louisiana and other sections where the ground is thoroughly cultivated, it trusts a great deal to its legs and cunning devices. In working on such birds, the dog must learn to govern his work by the circumstances of it. He might be an excellent performer on quail in the North and a poor one in the South, or he might be a good one in Mississippi and a poor one in Louisiana, though the presumption is that, if he was good in one section, he would soon be so in any other section after the necessary experience.

Dogs in Louisiana.

Many of the plantations of Louisiana are drained by open ditches running parallel at reasonably equal distances from each other, though the distances may vary greatly one field with another, and may be 50 or 200 yards more or less apart, while other ditches of like arrangement intersect them at right angles; thus a plantation may be cut up with more or less regularity into small squares surrounded by ditches. Some plantations may be irregularly ditched, while others, with a fair degree of watershed may not be ditched at all. The heavy rains round out the banks of the ditch and its bottom, and a fringe of weeds and brush thick and thin in places, strings along the banks and makes a fairly good shelter for the quail. On these land squares are grown cotton, or corn, or nothing, as the case may be, though if not cultivated there is always certain to be a good crop of weeds, affording plenty of quail food. When flushed in such places, the quail may fly a few yards to the first ditch, or may cross over two or three ditches before finding a place to its liking.

As mentioned elsewhere, the state of the weather may greatly affect the quail's habits. The bevy having gone to the ditches for safety, the dog, to be useful, must have great superiority in roading if he pursue successfully. When in the ditch, the birds run swiftly along the bottom. It is almost impossible at first to induce the green dog to go into the ditch, or, being in it is impossible to make him remain there, though it may not be over a foot deep, and dry. The green dog will promptly cross out from one side to the other, missing the scent and accomplishing nothing useful.

He does not know what is required of him. But once he catches the idea, he soon improves on it, following carefully along the bottom of the ditch and pointing the scattered birds here and there every few yards apart in ones and twos, the shooter having a good opportunity from his position on the outside to kill as the birds fly out.

The shooting along ditches is not so easy as one might imagine. Sometimes the birds run swiftly several hundred yards or more in the ditch and may then run out and across to other ditches, giving a trial which may try the most experienced dogs to follow.

If the birds happen to be near a cotton or corn field, where the ground is bare and there are no ditches for concealment, they may run so fast and far that the dog may never approach near enough to them to secure a point, and the shooter, who is inexperienced in this work, will then think that his dog is surely deceiving him.

When near the woods or switch cane the birds often take shelter therein; when in the latter cover it is well to abandon further pursuit of them.

In the sugar country, where there may be corn fields here and there among the broad levels of the sugar cane, the character of the shooting again changes. Many birds will be found in and around the cornfields, and then it is very pretty shooting.

It may not be amiss to mention, for the benefit of those who shoot in the sugar country for the first time, that they should keep their dogs out of sugar cane fields as much as possible.

The cane, in harvesting, is cut diagonally across with a knife, thus leaving a stump with an edge which will cut a dog's foot almost as a knife would. It is a common matter for a dog to split his toes or heel on cane stumps, with the resultant crippled condition and no more work from him for a time.

Winter Shooting in the South.

In Mississippi, in the midwinter season, the birds stay in the woods mostly. Good shooting may be had in the South from the middle of November to the first of March. Many of the Southern States have a longer local open season, but the dense cover and warm weather make a natural limitation to the sport.

The weather is mild, the birds are strong, and the sport is at its best in the winter months of the South.

Guns for Quail Shooting.

Quail shooting in the main is close shooting as to the ranges at which the birds are killed. Most birds drop within 25 yards, some much nearer than that distance.

A gun weighing from 6½ to 7½ pounds is of ample weight. The 12-bore is most commonly used, though the 16 and 20-bores are excellent, and are preferred by many sportsmen.

As a matter of course, the smaller bores may be much lighter than the 12-bore.

The 16 and 20-bores being smaller, their killing circle is less, though they shoot with good force in comparison with the 12-bore. Closer holding is required to shoot them well.

Whichever bore is used, it should not be closely choked.

There is no need of a choke-bore in quail shooting. Some shooters use a .28-caliber shotgun.

It is an extremely difficult matter to induce the average shooter to use an improved cylinder-bore gun. The recommendation to use an open bore seems to construe as reflecting on his ability to shoot a close gun instead of being accepted as sound information concerning the gun fit for that particular kind of game.

It requires time to effect a reformation concerning the use of choke-bores in quail shooting.

One needs to treat indulgently the emotional attacks, varying from sentimental to practical, which appertain to shooting; from the romance of it which requires that the landscape be bathed in mellow sunlight, the prairie bespangled with flowers, the breezes laden with the fragrance of the wild woods, the glories of nature coloring all to the attacks in the practical details which require the closest of guns in shooting quail and woodcock, the heaviest of powder loads when the lightest are better and what common sense dictates; or that a point, be it ever so well done and so accurate withal, is sporting heresy unless made by a black, white and tan "blue blood" dog.

The sportsman should go forth equipped for his sport according to its needs, and not to the whimsicalities of senseless fashion. He should not take a full-choked gun in cover, nor a cylinder-bore gun to shoot ducks. There should be intelligent adjustment of means to ends. Industry and skill and woodcraft should not be balked by visionary theories and inappropriate weapons.

A Rare Sport.

The foregoing is written of the quail as it refers to man's pleasure afield with dog and gun. It naturally is not fearful of man. It rather prefers to dwell near his haunts; not from an affection for him, but from

the fact that near cultivated sections there is always more food to be found than in the uncultivated. The matter of providing food for itself and its young is quite as constant and insistent in the life of the quail as it is in the life of man.

It often nests close by the cultivated fields. Its cheery, ventriloquous whistle, reiterating its favorite utterance "Bob White," may be heard about the farms, particularly in the morning hours, and "Bob White" has come into use to designate the bird itself. Sometimes the call is uttered with a short introductory note, and these, with a few alarm calls, or calls of inquiry when the birds have become scattered, seem to be about all the vocal means of communication which these birds have.

In many parts of the South, where the quail are in greater abundance, their sweet notes may be heard in many directions, at many distances, in the early morning and evening hours. These cries work great harm to it, for by them the shooter learns the whereabouts of all the birds in his neighborhood and "locates" the haunts of every bevy. In the fall, the cry "Bob White" often serves to inform the sportsman as to the best course for the morning's hunt. In the South the quail is called "partridge."

In the fall, when the shooting opens, the quail soon learns of the gunning dangers, and its habits thereupon change quickly to conform to a life of greater safety, though it will run many risks to be near an abundance of food. However, when danger is impending, it avoids the open much more than when danger is not, and is more alert, quicker to suspect mankind, and quicker to take alarm.

When spring returns, the quail seem to lose their fears of man, and they breed with little reference to concealment from him. Their confidence is unimpaired till fall approaches, when there is a repetition of all the fears and troubles and dangers of the preceding years.

He who can average three kills out of five shots, cover and open, is an excellent marksman. The shooter may make a run of ten or twenty straight kills, but there are soon sure to come misses if he does not pick his shots. In winter the shooting is much more difficult than in the fall. Of course, "the man who never misses" might do better, but "the man who never misses" is of the parlor, not of the field.

B. WATERS.

Quailing Without a Dog.

AS THE day approached for chicken shooting there was much planning around my house for which a small boy was responsible. The corner of the attic, sacred to rods and guns and field toggerly generally, was visited, and those things necessary for one on chicken shooting bent were collected and packed in the grip.

Our family physician, possessed of several fine pointers, had planned the trip. We were to go to a farmer in the northern part of the State who had a number of coveys marked down and whose stubble fields were "posted" against all comers but the Doctor and his friends. The boy had never shot a chicken and his pulse beat high whenever the subject came up. Certainly the prospects for a day or two of royal sport were of the best. Everything was fixed and settled that on my return from St. Louis we should start off. But my engagements lengthened out, and although the Doctor waited two or three days for me, when I returned I found he had gone. And successive Saturdays brought responsibilities that kept me at my desk. And the boy showed much self-control and patience through it all. One Saturday morning I slammed down the lid of my desk, and, gathering up some rods, we essayed a trip down to Prescott on the Mississippi River to try the bass off the wing dams, and boarding the train we waited for it to start, only to be told that on account of a washout it would be hours before it left the depot, and drawing a sigh of resignation mingled with keen disappointment, the boy shouldered the rods homeward and I went back to my office.

Then the quail season opened and Mr. Fullerton and I planned a trip. He was not only to supply the comradeship and good fellowship, but the dogs as well. He was to meet us at the shooting grounds, but some strenuous work in connection with the breaking up of the Heron Lake market-hunters held Mr. Fullerton at the last moment and we were like the mariner with "quail and quail everywhere, and not a quail to shoot," because we had no dog. And as far as we could learn there was not a dog in the village—that is, a quail dog.

"Come, pa, and let us tramp the woods; we may scare up something," and we tramped the woods. The boy was alive and alert to everything. The desolate and storm-beaten nests, the former occupants of which were now well toward the south, were quickly espied out by him, and the kind of bird builder conjectured at. The toadstools, mosses, curiously twisted trees, the giant elm riven to the roots by the electric fluid, all absorbed his attention. A passing flock of mallards, high up and afar, brought forth many questions concerning the proper way to hunt that wary bird.

And then we tramped and rested and talked the hours away in the October woods. I remarked to the boy how disappointed I felt over the mishap to our plans, and was met by the reply: "Well, we're having a great time, anyway." And as we walked along through the rustling leaves and turned our faces toward the hotel for our noonday meal, I vowed to scour the village once more for some kind—in fact any kind—of a dog. And I found a Good Samaritan who owned a finely bred pointer dog, young and absolutely unbroken. The owner gave me the pedigree of the dog, and while prognosticating all

kinds of fool things the dog would do yet, promised us some fun with him. The dog would find the birds, that was certain; but as to holding them—that was another story.

And getting a rig we bundled in and drove out of town a few miles, stopping at the first combination of stubble, thicket and woods we came to. We put out the dog and worked up a steep knoll in the stubble field. As he reached the top the dog suddenly turned and stiffened. A whirr, five quick shots, and the birds like a flash disappeared behind the knoll and presumably into the thicket lining the woods a short distance off. The boy unmistakably had killed his bird, one going well to the right, and was elated beyond measure.

And so the ball was opened. The dog certainly did "run in," and showed a thorough disregard for the first principles of discipline, obedience, and did no end of fool things, but he had a nose that not only found the living birds but the dead ones as well. As we drove along, at the roadside fifty yards ahead, grouped on a bit of closely cropped sward, we saw a bevy of quail. We pulled up. The dog scented the birds on the breeze, and, despite the yells of his master, started on a steeple-chase gallop for them. The main bevy stood alert and showed no intention of rising. Separated from the bevy was one bird, a few yards nearer to us, and this quail the dog selected, and sprang at it like a fox at his prey, endeavoring to seize it in his mouth. The quail sprinted ahead of the dog and we were all interested lookers on. The bevy was seemingly as much interested as any of us. It was but a few seconds before the dog gained on the bird, when it flushed, and, at the same time the whole bevy went into the air.

The dog watched them, and tracking them down unerringly ran to the spot, which, fortunately for us, was a brush heap, but having hidden themselves well under same, the dog had to stand point until we came up.

And so it happened that with a no-account dog, a dog that some impatient hunter might have, in a moment of rage, filled full of shot, we yet not only got birds, but enjoyed ourselves—especially the boy. Skirting the dividing line between stubble and woods Harold gave us a dissertation upon rabbit hunting, and was somewhat confident in his belief in his marksmanship on rabbits, when round the corner of the fence and through the stubble thirty yards away came a cottontail bounding toward him. He fired and missed, the shot tearing up the stubble above the rabbit. Then quoting freely from Bogaardus he tried to reconcile his miss. The shot had not dropped as he thought it would and for which he had made allowance, etc.

It certainly was a day full of experiences—especially of a canine variety. But we certainly went out into the field under no false pretenses, as far as the dog was concerned. But despite opinions to the contrary, we found him far better than no dog at all. It only went to show how people in this world can get along if they will only adapt themselves to their surroundings and to circumstances. We made allowances for the unbroken "pup," made the best of things, had a splendid afternoon's outing, gave the boy a most enjoyable time, and went home with a bunch of quail which the boy insisted on carrying himself, and of which he was very proud. So why complain if the dog did many things that he ought not to have done, and left undone those things that he ought to have done? He did the best he could, and did not do differently because of a lack of training.

His owner is to put him in the hands of a trainer, and some day we may again shoot over him when he will know better than to try to catch and eat every quail he scents and sees.

CHARLES CRISTADORO.

That Reminds Me.

THE other day I had to go down East on a little business over the end of the week, and, of course, I took my shotgun along on the chance that I might be able to get a day off with my friend, Ernest C. Davis, who has the inside track of a whole lot of bully good grouse and woodcock covers. On the way to the North Station I bought a copy of FOREST AND STREAM of October 17, and noted with much interest the letter of Mr. E. H. Kniskern, of Ridgway, Pa., concerning "Grouse Self Killings." I clipped this out and showed it to Mr. Davis when I got to his house late the next night, and he told me of a case of self-destruction by a grouse which beats anything I have ever heard of in this line.

Mr. Davis and a friend from down in Vermont had been shooting all day in the covers back of Rockland, and just at dusk were flying for home behind his little fast mare that only touches the high spots. As they came down over the brow of a little hill, with covers on both sides, something passed swiftly out of the cover on the right of the road and seemed to fly straight into the forward wheel. The horse was pulled up, and just as Mr. Davis got out to go back and see whether they had run over a bird, a partridge dropped out from under the front spring of the wagon and fluttered in the road, startling the horse, and nearly getting Mr. Davis run over. Apparently the bird had either gone through the front wheel of the wagon or passed just in front of it and flown into the spring, its neck being caught between the spring and the wagon box or between the spring and the axle, and it was so killed. The next day he showed me the exact spot where the incident occurred, and his description of the affair was corroborated in detail by a native who keeps a little cooper shop just at the top of the hill. I do not mean to infer that this story, remarkable as it is, would need any corroboration, for Mr. Davis is noted for his truthfulness, and anyway, I saw the wagon, the horse and the hill where it all happened.

While we were discussing the matter there in the road, and he showing me exactly how it all happened, the dogs rounded to a point in a corner of the cover just down the hill, and we shot there one of the biggest woodcock we got during the day. We found the woodcock fairly plentiful. I think they were mostly flight birds. We got nineteen birds in a day and a half, only five of them being partridges. There do not seem to be many young partridges anywhere in New England this year so far as I can learn. It is the general theory that the young birds were hatched out during the drought early in the spring.

and were nearly all killed by the long spell of cold rain which followed during June.

Not only is my friend Davis a good sportsman, but he can shoot like oiled lightning, and when he gets into a streak of luck, there is nothing that cannot happen to him. He has the slickest kind of a lunch box equipment made up to hold just the things you need, and this is always in the bottom of the wagon. There is included a little alcohol chafing dish for frying the steak and boiling the coffee at noon. After we got five or six miles out of town, he happened to remember that the bottle of alcohol for the chafing dish lamp had been left on the kitchen table. He had hardly finished expressing his sentiments concerning the matter, before we saw in the road ahead of us a package which had been spilled out of a wagon. I jumped out to examine it and found that it had consisted of two bottles—one of which, containing that which passes in the prohibition State of Maine for whisky, having been run over and broken; and the other sound and whole, containing a pint of alcohol. I think this ought to make a fitting addition to your "Strange Finds of Sportsmen."

That night we opened the camp in the birches at Alford's Pond and by eight o'clock we had finished our supper of broiled partridges and baked potatoes, had washed up the dishes and were ready to turn in. It had been decided that we should arise at 4:30 to get a good half day's shooting before going home, and Ernest undertook the contract to wake us up on time. After I had been totally unconscious for what seemed about ten hours, I heard him getting up and feeling around for a match. He called across the partition to ask what time I thought it was. I guessed it was about four o'clock. After he had bumped himself against the furniture and the doors, he got into my room and found a match in my shooting coat and got my watch out of my trousers and found it was 10:30. The next time I woke up it was 11 o'clock, but we got away in a jiffy and managed to get in another good half day's sport before going back again to be "chained to business."

ROBERT L. WARNER.

BOSTON, Oct. 23.

In Maine Woods.

BANGOR, Me., Oct. 24.—*Editor Forest and Stream*—The strange and curious things that people will read and what is worse, believe, in the metropolitan papers, actually beyond comprehension of the ordinary mind. To one living in the State of Maine, or who has become familiar with it by virtue of frequent visits, the great mass of so-called "information" that might well be termed "misinformation," sent broadcast through the land by reporters who are merely filling space in the daily press, is both disgusting and amusing.

A striking instance of this misleading "news" came your correspondent's notice this week, and it gave him cause for many a hearty laugh, although he was careful not to hurt the feelings of the two "innocents" most nearly concerned. Upon a train going north he met two men with rifles, who inquired the distance to Greenville and later secured all the helpful information the newspaper man was able to give them in the way of names of reliable guides, etc., as an aid to a pleasant and successful trip. They told, by degrees, how they had read in the highly reputable New York city newspaper of the wonderful increase in bears in Maine, embellished by wonderful instances to prove the story, and on the strength thereof they had come to Bangor, fully expecting to be able to pick up (in Bangor) a guide anywhere on the streets, and go forth to kill bear from there. It was something of a shock to find, when 700 miles from home that they must go nearly another hundred—as someone advised them—before they could hope to meet with the game of the great Maine woods. To be sure, one need not go as far as Greenville to find game, but neither could it be found in Bangor, except in very rare instances.

To-day has proved, at this writing, and the evening trains are yet to be heard from, the record breaker of the season, as more deer and moose have passed into and through this city than for any previous day of the open season. Over fifty deer came into the city on one night, besides several moose and bears, and the total pieces of game examined by the wardens at the depot was close to the hundred mark. To-night's train will be nearly as heavy, if not greater, and the shipment of the twenty-four hours ending at midnight will more like the "good old days" of 1902, when all previous records were eclipsed.

A matter that receives far less attention than it ought from sportsmen going into the woods of Maine, is the leaving of names and woods addresses with the nearest telegraph office. Nobody expects bad news, but it is liable to come when least expected, and the man who tells the station agent or telegraph operator how he can be found in case of urgent need, may save much delay and sorrow for himself. This was forcibly illustrated this week when an out-of-the-State man was telegraphed that his father was dead. The telegram was addressed to an unknown camp via Katahdin Iron Works, no one there or in that vicinity having ever heard of a camp run by a man of the name given. But a man was at once dispatched to Camp Comfort, thence to Brown & Son's, and still beyond Freese's, whence the messenger returned the Chairback Mountain camps, which he reached at night, only to find his quest fruitless there. Believing that the one remaining camp in that vicinity, the Houst Pond camp, must harbor the bereaved sportsman, the sportsman stopping at the Chairback Mountain camp volunteered to do as he would be done by, and pilot the messenger through the notch of the Chairback range to the camps, which was made as quick a trip as was possible, the trail being followed on the lope so as to get the man word in season to take the forenoon train out of Bangor. Finally the man was located and the message delivered at Barnard, miles away from the Katahdin Iron Works region, and on another line of railroad. The sportsman had left his address when he left the railroad for the woods, there would have been no delay in the receipt of the message, not to mention a great saving in unnecessary expense.

Caribou are undoubtedly drifting back into Maine, and unless the contention of some old hunters that they were

driven out by the deer is true, will before many years become once more plentiful in this State. Already they are being reported quite often by sportsmen and other hunters, and they have one caribou in Aroostook county that is attracting widespread attention. This animal has joined the flock of sheep owned by a farmer in Ludlow, not far from Houlton, and wherever those sheep go, so, too, does the caribou go, and nothing will seemingly drive the creature from its adopted friends. It is as little afraid of humanity as the sheep it mingles with, and many people have driven from all the country around to see the unusual sight.

Bears continue to form a most interesting feature of the shipments to and through this city, and there has been a considerable number of moose brought out of the woods by sportsmen. Robert B. Blair, of Brewer, joined a party of friends from Springfield, Me., for a trip into the region beyond that town, and two of the party killed bull moose, while there were several seen. They report that moose were wonderfully plentiful in that locality, and they had no trouble in getting what they wanted.

It is not likely that many parties will have the great luck of seven jolly traveling men who spent two days in camp on Sugar Island, Moosehead Lake. There were in the party Charles S. Gilman, of Portland; Whit. Sawyer, F. H. Lathrop, Charles Peeling, Harry Peeling, Charles Small, and A. S. Tripp, of Boston, and they not only killed what deer they wanted, but added three bears to the record for this fall.

Dr. W. B. French, of Boston, started out with his guide the other morning from Five Islands in Schoodic Lake, and his guide, Charles Hoxie, of Orneville, took him to a good moose section beyond Sebosis Lake. When the morning train from Bangor reached Milo, these men got aboard to ride to Schoodic, having killed, dressed and hung up two moose, and reached Milo in time for the train. It was a great morning's hunt.

Some others of the successful moose hunters include A. G. McClintock, of Washington, D. C., who has been at Nesowadnehunk Lake; N. L. Millard, North Adams, Mass., who has been at Trout Pond, near Grindstone; Ernest E. Rogers, of New London, Conn., who shot his moose at Webster Brook; Frank N. Houghton, of Somersworth, N. H., who made his hunting grounds around Fish Lake in the North Aroostook country; P. S. Noble, of St. Louis, Mo., who was in the Ox Bow region, going up the Aroostook to satisfactory hunting grounds. Dr. V. R. Gardner, of Factoryville, Pa., was one of a party that went into camp at Shin Pond, reached via Patten, and he killed a fine moose, with antlers spreading 51 inches; a very nice specimen. N. Ricker, of Holyoke, Mass., went home after an outing at the East Branch of the Penobscot, satisfied with a moose, a bear and two deer; Joseph G. Vaudreuil, of Worcester, Mass., secured his moose on or near Sandy stream, a tributary of Millinocket Lake.

HERBERT W. ROWE.

A Colorado Game Case.

COLORADO COURT OF APPEALS, SEPTEMBER TERM, 1903.

E. W. Hornbeke, Appellant, vs. C. M. White, Appellee.
Appeal from the District Court of Mesa county.

Argument for Appellant.

Statement of the Case.

December 10, 1900, White, plaintiff below, had in his possession 300 deer hides, which he had bought in the neighborhood of Meeker, Colorado, in violation of the game laws.

These hides he was transporting to Rawlins, Wyoming, to sell, when he was overhauled by the defendant, Hornbeke, who was then a deputy sheriff, and White and the hides were taken back to Meeker, where, by some sort of an arrangement with James Lytle, a deputy game warden, White paid \$30 and the hides were returned to him. True, the plaintiff claims that this transaction was wholly between the defendant and himself. Whatever the truth may be, it can make no difference in the result. Nor does it matter whether the transaction was a corrupt deal or a sale under the provisions of the game law.

On January 28, 1901, White was again found in possession of about the same number of hides in Axial Basin, when he was again overhauled by Hornbeke, who had then been appointed a deputy game warden in place of Lytle, and the hides were taken to Meeker, and there placed in the custody of T. H. Johnson, State Game and Fish Commissioner.

There is serious question whether these were the same hides taken from plaintiff on December 10 previous, but that is altogether immaterial, as he had no right of possession in either event when the seizure of January 28 was made.

On February 2, 1901, White filed his original complaint for replevin in the Rio Blanco County Court, and the hides were taken by the sheriff.

The case found its way into the Mesa County District Court, where it was tried before a jury, resulting in a verdict for plaintiff for some \$400.

Argument.

I. The Principles Underlying Game Laws.

This, we believe, is the first case under the game laws which has found its way into an appellate court of this State, and we deem it important to get before the court what we understand to be the true foundation and correct application of laws intended for the preservation of game.

Many cases have been heard in the courts below, on the criminal side, and the defendants acquitted on grounds as erroneous as those on which the plaintiff here succeeded, but, being criminal cases, the State was without remedy.

With the possible exception of the mountain lion, the coyote and the wolf, the most persistent and heartless enemies of the game, and at the same time the most difficult to detect and punish, are the meat and hide hunters and buyers.

If, with the law declaring the limit in possession for one person to be two horned deer (or any part thereof), and that in the open season only, a man can successfully get away with 300 hides of all sexes and ages, in the close season, then game laws are ineffectual, and the game department had as well be abolished.

The importance of this case is, therefore, apparent, and it is now for the first time up to this court to determine and declare the law in Colorado, and put an effectual quietus on this lawless business, and thereby aid in putting a stop to game law violations, and in protecting the game of the State from the annihilation soon to occur if the law is not more rigorously enforced.

A popular error prevails that possession and ownership of game, once acquired in pursuance of law, is of that fee simple and indestructible quality that attaches to the possession and ownership of property generally, instead of a qualified right depending wholly on the provisions of the laws relating to game.

It has been difficult for inferior courts to get rid of this idea, which must be done in order to properly administer game laws.

It has also been difficult for some courts to comprehend that cases involving game law violations are not solely between the individuals named in the suit, but also between the State and the violators, and that the officer or party representing the State is wholly without authority to act except in the manner and to the extent provided by law, and has no power to waive any provision of the law, condone any offense or create any estoppel against the State.

This is especially so in a civil case, like the one at bar, which the court below seems to have treated as an equitable action between the parties, in which the defendant officer might estop himself and the State by his failure to comply with the requirements of the law, and thereby deprive the State of its property.

Geer vs. Conn., 161 U. S., 519, is the leading game case in this country, and in it the principles involved in the game law, and their origin, are so fully stated that we trust the court will not only read our quotations therefrom, but read the whole case.

The questions involved in the case at bar arise under the game laws of 1899, chapter 98, the amendments of 1903 not affecting them.

Section 16, division A, is as follows:

"All game and fish now or hereafter within this State not held by private ownership, legally acquired, and which for the purposes of this act shall include all the quadrupeds, birds and fish mentioned in this act, are hereby declared to be property of the State, and no right, title, interest or property therein can be acquired or transferred, or possession thereof had or maintained except as herein expressly provided." (Page 188.)

In Illinois a similar statute exists and in Meul vs. People, 64 N. E., 1106 (Ill.), it is said:

"Prior to this enactment the State had general ownership of animals *feræ naturæ*—not as a proprietor, but in its sovereign capacity, as the representative of the people, and for the benefit of all the people in common. Sec. 11 places the title and ownership in the State as a proprietor and the individual may no longer acquire ownership by capturing, killing or reclaiming such animals, except in so far as permitted so to do by other provisions of the act."

This is perhaps slightly different from the view taken in the Geer case, as to the status of game in the absence of statutes like those of Colorado, Illinois and many other States, vesting ownership in the State, as the Geer case apparently makes no distinction between the two kinds of ownership.

This difference, if any, however, is of no practical importance. The status of the game when owned by the State in its "sovereign" capacity, was as the common property of the people, with the right in the people to capture or kill at pleasure, except as prohibited by law.

Its status under the statutes of Colorado and other States vesting the ownership in the State as a "proprietor" takes away from the people the right to capture and kill unless prohibited, leaving under these statutes no right except as permitted. In other words, the game without such statutes was like the water of the streams, open to the first appropriator, except as prohibited by law, while under these statutes, like the land and timber of the State, it can be appropriated to use or held in possession only as permitted by law.

Both cases, however, as well as all other game law cases, affirm the power of the State to restrict, regardless of the character of its ownership. All agree also that such laws are within the purview and proper exercise of the police power.

In Stevens vs. Maryland, 43 A., 930, it is said:

"That the total prohibition of having game, from whatever source derived, in possession during the closed season, is a reasonable, if not necessary, means of protecting the domestic game of the State making the prohibition, has been held in a number of cases,"—citing them.

In the Geer case the game laws of Connecticut permitted the killing of birds during certain months, but prohibited their transportation out of the State, or possession with intent to so transport.

Geer was convicted of possession with intent, and his conviction having been affirmed in the Supreme Court of the State was taken to the United States Supreme Court, where he denied generally the validity of the act, and also alleged it to be in violation of interstate commerce clause of the Federal Constitution.

The Supreme Court says that the question presented is—

"Had the State of Connecticut the power to regulate the killing of game within her borders so as to confine its use to the limits of the State and forbid its transmission outside of the State?"

It is then stated that,

"From the earliest traditions the right to reduce animals *feræ naturæ* to possession, has been subject to the control of the law-making power."

The court then points out the difference between the qualified ownership in game acquired under restrictive game laws and that unqualified right in other property acquired under general and unrestrictive laws; and that

the right to kill the game in Connecticut was only given on condition that it be not transported beyond the State limits.

The court also cites from *Magner vs. People*, 97 Ill., 320, the following:

"So far as we are aware, it has never been judicially denied that the Government, under its police powers, may make regulations for the preservation of game and fish, restricting their taking and molestation to certain seasons of the year, although laws to this effect, it is believed, have been in force in many of the older States since the organization of the Federal Government. * * * The ownership being in the people of the State, the repository of the sovereign authority, and no individual having any property rights to be affected, it necessarily results that the Legislature, as the representative of the people of the State, may withhold or grant to individuals the right to hunt and kill game or qualify or restrict, as, in the opinions of its members, will best subserve the public welfare."

The interstate commerce question was disposed of by declaring that, although the exercise of the police power in prohibiting the export of game might remotely and indirectly affect interstate commerce, it was not thereby rendered invalid.

Referring, then, to some cases in Kansas and Idaho holding otherwise on the question of export, the court says:

"The reasoning which controlled the decision of these cases is, we think, inconclusive, from the fact that it did not consider the fundamental distinction between the qualified ownership in game and the perfect nature of ownership in other property, and thus overlooked the authority of the State over property in game killed within its confines, and the consequent power of the State to follow such property into whatever hands it might pass with the conditions and restrictions deemed necessary for the public interest."

The foregoing discussion is for the purpose of showing the principles involved and getting started right, as the questions decided there, although not precisely like those in the case at bar, rest on the same principles.

The sum of the matter, then, is that one suing for the possession of game must point out the statute giving him the right of possession, and also show that he is strictly within its terms. Failing in either, he cannot succeed. And this rule applies to his pleading as well as his evidence.

II. The Application of these Principles.

The court below erred in overruling the objection to the introduction of any evidence, the motion to direct a verdict for defendant, in giving instruction IV., in refusing each instruction asked, and the verdict should have been for defendant. Other errors appear in the record, but the foregoing, or any one of them, raise the only points we deem it necessary to discuss.

White claims that the deer hides in question were the same ones which he had in December, and as, presumably, the jury must have so found, we will discuss it on that assumption.

The game law, section 7, division B, then provided as follows:

Sub. 1. The open season for deer having horns * * * shall begin Aug. 15 and end Nov. 5 next ensuing. (Page 192.)

Sub. 7. The right given by this section to take game or fish is limited to food purposes, * * * and no person shall take, kill or have in possession in any one season more than * * * one deer, and one antelope, or, instead of one deer and one antelope, he may have either two deer or two antelope. (Id.)

Sub. 8. No game or fish shall be held in possession by any person for more than five days after the close of the season for killing the same, except as in this act otherwise provided. (Page 193.)

Sec. 16, Division D. Any person having the lawful possession of game or fish killed within this State, may, upon proof of such fact, have issued to him, by the commissioner, a storage permit which shall authorize storage, possession and use of the same not longer than ninety days next ensuing the open season therefor. (Page 209.)

Sec. 18, Division A * * * whenever the possession, * * * transportation, storage, sale, * * * of game or fish is prohibited or restricted, the prohibition and restriction shall, where not specifically otherwise provided, extend to and include every part of such game or fish, and a violation as to each animal or part thereof shall be a separate offense. * * * (Page 189.)

By section 19, division A, the possession of game or fish, unaccompanied by a proper and valid license, certificate, permit or invoice, is prima facie evidence of unlawful taking and possession. (Page 189.)

So that White not only had 298 more hides than the law permitted, some of which were does and fawns, which are contraband at all times, but, having no storage permit after the season closed, his possession on December 10 was doubly unlawful.

More than that, sections 11 and 13 of division D provide as follows:

Sec. 11. When any person lawfully in possession of game or fish shall desire to transport the same within this State, the transportation of which is not herein otherwise provided for, or out of this State, the commissioner may, upon being satisfied that the possession and transportation is not in violation of the spirit of this act, grant a permit therefor, and thereafter during the period of ten days after its date, such transportation shall be lawful between the points therein named. Such permit shall be substantially in the following form:

Form 11
STATE OF COLORADO.
DEPARTMENT OF GAME AND FISH.
TRANSPORTATION PERMIT.
No. .. Denver,, 189..
This certifies that Mr. is entitled to transport from, Colorado, to the following game and fish, to wit, This authorizes possession and transportation between the points named herein only, but not sale or storage. Void after ten days from date.
.....
Commissioner.

Sec. 13. Game or fish may be transported out of this State only when accompanied by a permit from the commissioner authorizing the same, as provided in Sec. 11 of this division, or when being transported from some other State or Territory where taken or killed, through this State to some other State or Territory.

White was, therefore, by his own admission, attempting to export them without an exportation permit. Bearing in mind that, under the statutory ownership of the State, we do not need to look for a prohibition of an act to render it unlawful, but that the defendant must show that he is acting under a permission found in the law, he had no right to export, or attempt to export, these hides without such permit, as section 1, division G, provides that:

Every attempt to violate any provision of this act shall be punishable to the same extent as an actual violation thereof * * * (Page 217.)

2. The defendant, as deputy sheriff, had a right to seize these hides under section 11, division A, which provides:

The commissioner * * * and every sheriff and constable, in his respective county, is authorized and required to enforce this act and seize any game or fish taken or held in violation of this act * * * (Page 187.)

When, therefore, the defendant seized these hides, on December 10, the possession was then restored to the State, where it rightfully belonged, and the plaintiff must show a right to have them again in his possession on January 28, 1901, before he can successfully maintain his replevin suit.

3. The only way he could have lawful possession of them again, at any time, would be by a sale and purchase under sections 9 and 10, division D, which are as follows:

Sec. 9. All game and fish seized under this act shall, without unnecessary delay, be sold by the officer seizing the same, or by the commissioner, except when a sale is impracticable or is likely to incur expenses exceeding the proceeds, in which case the same shall be donated to any needy person not concerned in the unlawful killing or possession thereof. Possession by virtue of such sale or donation shall not be unlawful. The proceeds thereof, after deducting the costs of seizure and sale, shall, if made by the commissioner or any warden, be paid into the State treasury, but if made by a sheriff or constable, shall be paid, one-half to the commissioner and one-half into the treasury of the county where the seizure was made.

Sec. 10. In case of such seizure and disposition the officer making the same shall sign and give to each purchaser or donee an invoice stating the time and place of disposition, the kind, quantity and weight, as near as may be, of the game or fish disposed of and the name of the purchaser or donee. Such invoice shall authorize possession, transportation within this State, storage and sale for thirty days after date and shall be substantially in the following form:

STATE OF COLORADO.
DEPARTMENT OF GAME AND FISH.
OFFICER'S INVOICE.
....., 190..
Disposed of by me, this day to.....
the following game and fish, to wit: kind,
number,; weight,; the same
having been seized and disposed of by me under the provisions of
the game law. This authorizes possession, storage, transportation
within this State, and sale. Void after thirty days from date.
..... (Title of Officer.)

(Page 206.)

That any such sale took place is not shown by White's evidence, nor is it pleaded in his amended complaint. All that is there said is that the defendant retransferred and delivered the hides to plaintiff for the consideration of \$30, "stating" to plaintiff that he had a right to do so. This comes far short of pleading a sale and purchase under and by virtue of the law.

Giving all the weight to his pleading and testimony that can be fairly claimed for them, they show nothing more than a personal deal with the defendant as a private individual.

The defendant says he had no part in the deal, but so far as the legal effect is concerned it makes no difference.

The State is the real party in interest, and is not bound or estopped by an unauthorized act of an individual or an officer. More than this, the plaintiff cannot predicate a right and maintain a suit upon an illegal act to which he was a party. He it is who is invoking the aid of the law, and his right must be a perfect one or he must fail.

4. But if there was an actual bona fide sale on December 10, 1900, the possession of White on January 28, 1901, was nevertheless unlawful.

First. Because he received no officer's invoice or bill of sale, as provided in section 10, just quoted. It does not appear that he asked for one and was refused. It was as much his duty to demand an invoice or bill of sale as it was for defendant to give him one. Indeed, the fact that he neither asked for nor received one, shows that it was not considered an actual sale under the law.

Having elected to receive the hides without the invoice which the law makes essential to the right of possession, his possession at once, and for the second time, became unlawful, and the hides were subject to seizure by any officer of the law the moment they were returned to him.

This provision of the law cannot be waived by an officer any more than it can be by the violator.

We must not be understood as asserting or assenting to the proposition that the defendant was personally concerned in any unlawful or corrupt deal. His testimony is that he was not, and he is entitled to the benefit of it. But we are arguing it from the worst view possible, for if a corrupt or authorized act of an officer, whose duty it is to enforce the law, can enable a violator to escape punishment, then the door is opened wider than ever before.

But we do not have to rely even upon this principle, as we will now proceed to show.

Second. If it was a sale and he had received an invoice or bill of sale in due form, it could have no force beyond January 9, being the thirty days provided for in the law. The law makes no provision for extending the right of possession thereafter, except in pursuance of a storage permit, before referred to, and there is no pretense that he had anything of that kind.

So that, if everything connected with the sale was waived, and lawfully waived; if every illegal act of plaintiff and of defendant and of Lytle was condoned, and lawfully condoned; pardoned, if you please, by the Governor, yet upon the expiration of thirty days from the date of sale, the possession of plaintiff at once and for the third time became unlawful, and the hides subject to seizure.

A storage permit under section 16, before cited, can only be issued to one having lawful possession. Under an invoice of sale, if one had been issued to him December 10, 1900, his lawful possession ceased January 9, 1901, and thereafter there was no authority vested in any officer to issue a storage permit.

So that if everything which plaintiff could possibly claim by reason of a lawful sale by an officer to him be conceded, all right of possession ceased nearly twenty days before the seizure of January 28, and nothing the officer or game warden did or failed to do on December 10 relieves the plaintiff in the slightest degree, as to unlawful possession.

Third. He was, on his own confession, again attempt-

ing to take them out of the State in violation of the sections before referred to. If he had complied with the law and paid the fees for transportation out of the State, they would have amounted to \$1,500. (Section 2, division H, page 220.) Thus, for the fourth time, his possession became unlawful, and this is also totally disconnected with the alleged sale and the acts done or undone at that time.

The purpose of these sections was to discourage the hide hunter and the hide buyer, and make the way of such transgressors hard, and it ought to be hard.

In ex parte Maier, 103 Cal., 476, it was claimed that the game in question was purchased in the State of Texas, and being brought into California made it an article of merchandise, the possession of which the Legislature could not forbid. The case was elaborately considered and numerous authorities referred to, and the validity of the statute upheld.

In State vs. Rodman, 58 Minn., 393, the question was also as to the right of possession in the close season of game purchased in the open season, and the statute was sustained, and a large number of cases cited.

In People vs. Haagen, 72 Pac., 836 (Cal., 1903), the prosecution was for the possession of fresh salmon during the close season. The defense was that the salmon were caught or purchased during the open season, and therefore became an article of merchandise, the subsequent possession of which the State could not prohibit. The defense was held bad, and the Maier and other cases referred to.—See, also, State vs. Snowman, 94 Me., 99.

The law makes these regulations as to the right of possession and exportation in order to protect the game of the State, and no failure of duty or corrupt compromise can affect the right of the State to retake these hides when held in total disregard of the requirements of the law.

Besides this, the amended complaint is fatally defective in not showing that the place of taking was in Rio Blanco county, the place of commencing the action, and in not alleging that the property was in that county at the time the action was commenced.—18 Enc. P. & P., 540.

The plaintiff was entitled to possession only by virtue of ownership created by the laws of Colorado, and hence his complaint is insufficient in not averring all the facts necessary to such ownership.—18 Enc. P. & P., 537-538; Baker vs. Cordwell, 6 Colo., 199-202.

From the day it was commenced to the time of the verdict, the case never had a leg to stand on; the objection to the introduction of evidence and the motion for judgment in favor of the defendant ought each of them to have been sustained.

Hundreds of the game law cases have been decided in the higher courts, but the books will be searched in vain for one holding that the right of possession and traffic in game may not be restricted by the State at will.

In the Geer case it is said:

"We have been referred to no case where the power to so legislate has been questioned, although the books contain cases involving controversies as to the meaning of some of the statutes."

The misfortunes of game laws have never been in the courts of last resort, but in inferior courts, where the laws have been frittered away and made a fool of by acquittals in the face of overwhelming evidence, and often in the face of admissions by the defendant showing his guilt. This comes from an unreasoning prejudice on the part of the people generally. This has been most intense among residents of the game regions themselves, many of whom have taken the view that game laws are made for the benefit of the rich tourist and the city hunter. Nothing could be further from the fact. The men of limited means and the residents of the game regions are, of all persons, most interested in game protection. If protected by reasonable laws, game will always be within their reach. If it is destroyed at home, the hunter of ample means can go to British Columbia or Alaska, while the one of limited means will be altogether deprived of it.

When the people are educated out of this short-sighted prejudice, they will see the special benefit to them of game laws and give them a hearty support, instead of conniving with or assisting violators in evading them.

The plaintiff has amended his complaint twice in an effort to state a cause of action, and has failed. Under the undisputed facts he could not then, nor can he ever, amend it so as to state a cause of action.

His disregard of the plain requirements of the law has placed him beyond the possibility of success.

The case ought not only to be reversed, but dismissed without further annoyance to the officers and the courts, and that the people of the State may understand that game protection has come, and come to stay.

S. G. McMULLIN, District Attorney, and
D. C. BEAMAN, for Appellant.

OCTOBER 7, 1903.

In New England.

BOSTON, Oct. 24.—Editor *Forest and Stream*: For shooting on Sunday, James Chapman, of Mansfield, has been arrested at Norton by deputy sheriffs Perry and Nerney. All officers qualified to serve criminal processes are bound by their oath to look after the enforcement of game laws, but too few give any attention to their violation.

On the 21st Governor Bates visited the Walnut Hill Rifle range, where he qualified as a first-class marksman, making 40 bullseyes out of 50 shots at 200 yards. Several members of his staff also made excellent scores.

Your correspondent received a pleasant call from Dr. M. G. Munro, of Gardner, Mass., this week. He says he has had very good bird shooting in his section this month, securing a number of ducks, quail and partridges. He also killed a wildcat weighing 29 pounds; he thinks it was a genuine loup cervier. This will be a surprise to many, as it was to me. The Doctor is a son of the famous Nova Scotia guide and woodsman of Maitland, J. V. Munro, with whom several well-known American sportsmen are acquainted. Maitland (Annapolis county) is a good point from which to reach fine trout waters, and is the center of a moose country as well. The Doctor visited the old home this summer and he tells me that

while there he saw three moose, but this was in the close season. He has a camp on the Kegmagee Stream. The building of the Caledonia Branch of the Annapolis Valley Railroad enables sportsmen to ride by rail to within ten miles of the settlement.

Mr. A. B. F. Kinney, of Worcester, who called on Wednesday, tells me that there is a great scarcity of partridges in that region of Worcester county.

Mr. R. C. Dixey, of Boston, and others, have just organized the Berkshire Hunt Club at Lenox. Mr. Giraud Foster, Mr. Dixey, Mr. Samuel Frothingham, and Mr. C. A. Bristed are some of the officers, and Mr. C. G. Gilmore is master of the hounds. There are already forty members.

Connecticut Deer.

Two deer were recently struck by a freight train on the Air-Line Division of the N. Y., N. H. & H. R. R., near Montowise Station. They were so frightened by the approach of the train that they stood still on the track till killed by the engine.

The first Vermont deer reported killed was shot by Herbert Estes near Pownal. On Rice Hill, Sheldon, a Swanton hunter killed one also on the first day of the open season. On the 23d, in Lanesboro, Topsham, Gorton, Stowe, and several other towns, deer were killed weighing from 150 to 200 pounds—one was reported to weigh 400 pounds, another 300. If true, the Vermont deer show the benefit of good feed and time to grow.

A sportsman from Goffstown, N. H., hunting in Grafton and Alexandria is reported to have killed one weighing 325 pounds. Two Center Harbor sportsmen secured a deer this week. A freak of nature in the form of a five-legged deer was killed by a lumberman named Grover near Northeast Carry, Maine, recently, the fifth leg being perfectly formed and attached to the front part of the body.

An experiment to test the value of a close time on lobster catching has been made this summer by the fishermen at Matinicus and Cribhaven, Maine. They agreed among themselves not to set any pots in August and September this year. Four thousand pots were put into the water September 30. During the next two days 10,000 lobsters were taken. One fisherman got 360 in his traps the first haul. This is said to beat all previous records. This result is worthy of attention on the part of all who wish to see the lobster industry perpetuated.

CENTRAL.

Virginia Shooting.

SOUTHERN hotels are adopting the game preserve system for the benefit of their guests. Among these the Hotel Chamberlin, at Old Point Comfort, has taken the precaution to provide an ample shooting territory.

The territory adjacent to James River is well known for being one of the best natural breeding places of all varieties of game found in this part of the country, which accounts for the many clubs of sportsmen who own or lease immense tracts of land, including marshes and creeks, for the shooting privilege alone. In fact, so much of the desirable property is restricted in this manner that it is difficult for the non-member and non-resident to find a suitable place to enjoy a few hours' sport with the gun.

The management of the Hotel Chamberlin has acquired a large acreage of the best located land in this section for a shooting preserve, where the guests of the hotel can have the opportunity of hunting under all the necessary conditions and protection. The preserve is situated in James City county, about one hour's ride from Old Point Comfort, on the Chesapeake & Ohio Railroad, which makes it easy of access and so convenient as to enable one to leave the hotel right after breakfast, shoot all day, and return in time for the evening meal. If it is preferred to remain over night, a lodge is provided for that purpose. By natural and artificial means the preserve, which consists of ten thousand acres, has been made as near perfect as possible, and it is therefore not conceivable how a day's time can be more pleasantly spent. Aside from squirrel, possum, rabbit, and coon, in their season, there is an abundance of quail, ducks, brant, wild turkeys and woodcock, during all the late fall and winter; in the spring, snipe; while in the early autumn millions of sora afford great sport along the shores and marshes. The Chamberlin preserve is unique from the fact that the season is so unusually long. There is good shooting from September to May.

On the Monroe Marshes.

MONROE, Mich., Oct. 17.—Shooting in the Monroe marshes has been very excellent this year, and those members of the Marsh Club have been enjoying fine sport among the canvasbacks. After the 20th of the month all, or nearly all, of the members will be at their club house for the remainder of the season. They are expecting to entertain as their guest this year former President Grover Cleveland, who will, for the first time, experience the delights of shooting in the finest duck preserves in this country. Canvasbacks and redheads predominate here, and a record for one man of 120 in a day has been made.

F. H.

Long Island Ducks.

GOOD GROUNDS, L. I., Oct. 26.—Just a few lines to let you know, as well as your readers, that the Shinnecock Bay is full of ducks of all kinds, and the Bay men claim there have not been so many birds here for the last twenty years as there are now in the bay. Mr. Schuyler, of Wall street, went out last week and averaged from 40 to 100 birds a day. Quail and partridges are also plentiful here; so if any gunners want good sport, now is the time to come.

E. A. BUCHMILLER.

All communications for *Forest and Stream* must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Pennsylvania Shooting.

SAYRE, Pa., Oct. 23.—Gray squirrels are reported plentiful in some sections of Pennsylvania and unusually scarce in others. Across the woody ridges of the Wyandoming country some fine bags of squirrels have been recently taken, but in woods about Sayre where ordinarily ten or more grays may be bagged in a day, only here and there is one found.

Generally speaking, ruffed grouse are reported less plentiful than usual, the wet nesting season having, it is said, reduced the number of young birds hatched to considerably below the normal. However, as the season advances it is likely that the wary grouse will be found in greater numbers than the present visible supply would indicate.

The woodcock supply is about an average one, taking the past few years as a basis for comparison, which means, of course, that a few long-bills may be had for the seeking. And how delightful the quest after all! There is really nothing in the whole line of sportsmanship quite so enticing as an October day abroad a likely woodcock ground with the big robust fellows bouncing up over the line of vision to stir the blood and test the accuracy of one's aim.

The quail crop is about normal, but the birds in many sections—in fact, in most sections—of the State are small and immature, and will require some time in which to grow to full size. In view of which sportsmen may well forego pursuit of these confiding little chaps.

The rabbit season, which opens November 1, promises an enormous stock of "bunnies" in all parts of northern Pennsylvania.

From Cayuga Lake a friend advises that the last cold weather brought down an unusually large flight of wild ducks of all varieties, and the shooting at the northern end of the lake, and over the Montezuma marsh, during that time was particularly good. M. CHILL.

Long Island Robin Potters.

NEW YORK, Oct. 23.—*Editor Forest and Stream:* Is there any game protector for Long Island City, Woodside, Corona, and North Beach? I ask you this for this reason: Last Sunday on the 10 o'clock boat for Astoria were four Italians with guns. I thought at first they had a shooting match in some park, but in my walk through the above mentioned towns I found at least eight gunners shooting robins, and anything with feathers. One could hear the report of shotguns in every direction all day. Seven of the men I saw were Italians. Is there no way of stopping this? As there was a strong wind the poor birds would only fly a hundred yards or so and light on another tree, so I guess the Italians found very good shooting. G. E. J.

New Hampshire Game.

DERRY, N. H., Oct. 20.—*Editor Forest and Stream:* Still the report is that ruffed grouse are very scarce. Woodcock have been coming some our way. One man got twenty in three days. I saw three fresh 'coon skins in one of my neighbor's barns. J. W. B.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Fish and Fishing.

Angling Contests in England and in Canada.

THE Fen district of Stonea in Cambridgeshire, England, was last month the scene of a fishing contest held under the auspices of the Sheffield Anglers' Association, the members of which are stated to number 18,000. In the competition 970 anglers actually fished. Separated by intervals of a few yards only they covered a distance of six miles—three miles on each side of Stonea railway station. The total value of the prize list was £120, and the first prize (£10) was secured with a catch weighing 5 pounds 14¾ ounces. So that less than six pounds of coarse fish was the best basket made in the day's fishing by any of the 970 anglers participating in the contest. Surely the Waltonian qualities of patience and quietness are possessed in a superlative degree by our English angling brethren, and often, very often, must their experience recall that of the poor Galileans who toiled all night and caught nothing. But how distressing to dear old Juliana Berners, who endeavored to limit the circulation of her fishing book lest the sport of angling might become too much vulgarized if it fell into the hands of the common people, would have been this long row of nearly a thousand anglers crowded along six miles of water, and how enormously has the pastime become popularized in England since the good prioress wrote in her "Treatyse of Fysshynge wyth an angle:" "For whanne ye purpoos to goo on your disportes in fysshynge ye woll not defyre gretly many perfonces wyth you, whiche myghte lette you of your game."

At least two Canadian newspapers have offered prizes this year for angling competitions, the awards to go to those producing evidence of having taken the heaviest fish of certain species during the open season of 1903. While the offer of a prize for the largest fish is likely to work less injury than one for the biggest basket, as offered by the Sheffield Anglers' Association, I cannot avoid the temptation to go on record as opposed to angling competitions of all kinds in which size or quantity of fish captured are the determining factor. It would be different if the competition took some other form, such as the measure of success achieved in improved

methods of angling, in the use of finest tackle, in a more intimate knowledge of the fish life of lake and river, in wrestling from nature her innermost secrets, in a more profitable reading of the pages of her ever open book, in renewed health of mind and body and a higher appreciation of the grandeur of this beautiful world and of the outdoor life which it constantly offers us, and last, but not least, in the acquisition of a deeper sense of gratitude that these pleasures are within our reach, and that we have life and health and leisure to go a-fishing. What, in comparison with such joys as these, and with the rare delights of forest, lake and stream, can possibly be the assurance that we have caught a bigger fish or a larger number of them than our fellow anglers?

Nevertheless it is uninteresting neither to the angler nor to the scientist to hear of new records in size of captured game fishes, and possibly these newspaper prizes may cause the publicity of some which would not otherwise become very widely known. In my last letter to FOREST AND STREAM mention was made of a trout which had turned the scales at nine pounds, and which had been captured in the Grand Lake Jacques Cartier. A newspaper in Montreal, which had offered a prize for the largest trout of the season caught in Canadian waters, has not only received satisfactory testimony of the taking of two brook trout of Lake Jacques Cartier, weighing respectively 9¼ and 8¾ pounds, but has the mounted skins of the two monsters on exhibition in its office windows. There are some who claim that the larger of these fish is probably a record one, so far, at least, as Canadian waters are concerned, though there may be some successful American anglers who have something to say about almost or quite as large fish taken in the Batiscan or other famous northern waters.

An Interesting Legal Decision.

The Superior Court of the Province of Quebec, sitting at Three Rivers, has recently given a decision of great interest to members of Canadian fish and game clubs. At the last annual general meeting of the St. Bernard Fish and Game Club, General W. W. Henry, U. S. Consul at Quebec, presided, in his capacity as president of the club. The attendance of members was not large, but General Henry and his friends had a majority of proxies, though they were in the minority of those present. The test of strength of the rival parties for the control of the club's affairs was made upon the election of treasurer. There were two candidates for election, James W. Brock and Charles W. Wilson. The friends of the former, who were in the minority at the meeting, but who held a majority of proxies, proceeded to elect their candidate, when the other side raised the point that the proxies should be set aside and only the votes of those present be counted, since there was no provision in the by-laws of the club for voting by proxy. General Henry declared that the proxies were perfectly legal in a club duly incorporated under the laws of the Province of Quebec, and had a perfect right to consideration. The other side appealed from the decision, and when General Henry refused to entertain the appeal, the majority of those present declared the chair overruled, and instructed the scrutineers not to count the proxies. Mr. Wilson was thereupon declared elected Treasurer. Later, General Henry took a writ of quo warranto against Mr. Wilson, claiming that he had been illegally elected to the position which he had usurped, and requiring him to cease to occupy it or to fulfill its duties. The decision of the court is that the St. Bernard Fish and Game Club is a corporate body, legally constituted in virtue of the statutes of the Province of Quebec, and as such governed by the laws concerning joint stock companies, and that in virtue of these laws the voting for the election of directors may be by proxy. It is consequently declared that Mr. C. H. Wilson usurps, intrudes into, and unlawfully holds and exercises the office of treasurer of the club, and orders that he cease to so occupy and to exercise the said office.

All the fish and game clubs in this Province are incorporated under the same statutes as the St. Bernard, and the decision above reported may be therefore applicable to them; but it is always advisable that the by-laws of the club should specifically state whether or not proxies are to be recognized, in order that no misunderstanding may occur on the point. Both time, money and good sport may be wasted by the lack of such an arrangement, and perhaps good fellowship and old friendships among sportsmen sorely tried or altogether severed. Fortunately for the St. Bernard Club, the members of the two contending parties are too good sportsmen to permit the holding of different views as to the management of the club's affairs to interfere with their old-time friendships. But club memberships are not always so happily constituted.

Izaak Walton and his Friends.

There are good and sufficient reasons, as every angler knows, as well as many who are not anglers, for the cult of the gentle Izaak. The reverence paid him is so great that scarcely a year now passes that does not witness a new edition of his "Compleat Angler," and many of his contemporaries have been made memorable simply because they were counted among his friends. I am reminded of this latter fact by the recent issue of a new work in England, entitled, "Izaak Walton and His Friends." In a sense, of course, all anglers and all bookmen are Walton's friends. But the friends of whom Mr. Stapleton Martin writes in the book in question are chiefly those of Walton's personal acquaintances whom he honored with his friendship, and who, according to one of the number, Charles Cotton, must have been an exemplary lot, "for my father Walton," he says, "will be seen twice in no man's company he does not like, and likes none but such as he believes to be very honest men."

One of Walton's friends, whose biographer he became, was Dr. Sanderson, Bishop of Lincoln, and in turning over the pages of a Boston book dealer's catalogue the other day, I found the entry descriptive of quite a unique copy of this biography, an entry which, for the moment, made me envious of those who possess the means of gratifying their love of books and of Walton. This copy, for which the sum of \$100 was asked, and no doubt promptly paid, was one of the original edition of 1678, bound in sheepskin, measuring 4½ by 7 inches, containing

276 pages and a portrait engraved by R. White. It was a presentation copy from the author, as noted in the handwriting of the recipient—the Bishop of Salisbury—"Seth Sarum, Donum Authoris June 20:78." What makes the book invaluable to the Waltonian is the fact that it contains a number of corrections in the text, in the hand of the author, made with the pen of which Wordsworth so well says that

"the feather whence the pen
Was shaped that traced the lives of these good men,
Dropt from an angel's wing."

E. T. D. CHAMBERS.

The Alaska Salmon Fisheries.

THE special commissioners sent out by Hon. Geo. M. Bowers, Commissioner of Fish and Fisheries, to make a study of the salmon fisheries of Alaska, have returned to Washington, after an absence of nearly four months. The commission consisted of President David Starr Jordan, of Stanford University; Dr. Barton Warren Evermann, assistant in charge Division of Scientific Inquiry of the U. S. Bureau of Fisheries; Mr. J. Nelson Wisner, field superintendent U. S. fishcultural stations; Mr. Cloudsley Rutter, naturalist, Str. Albatross; Mr. A. B. Alexander, assistant in charge Division of Statistics and Methods of the U. S. Bureau of Fisheries, and Lieut. Franklin Swift, U. S. N., commanding the Albatross.

The following assistants to the commission accompanied the expedition: Dr. Harold Heath, Dr. Chas. H. Gilbert, Mr. M. H. Spaulding and Mr. Harold Jordan, of Stanford University; Mr. F. M. Chamberlain, Mr. L. E. Goldsborough and Mr. H. C. Fassett, of the U. S. Bureau of Fisheries, and Mr. A. H. Baldwin, the well-known fish artist.

The principal object of the investigations was to make a careful study of the salmon fisheries of Alaska for the purpose of determining what regulations are necessary for their preservation.

The steamer Albatross, which was assigned to the work, sailed from Seattle for Alaska June 18. Visits were made to all the salmon canneries, salteries and fishing grounds in Alaska from the southern boundary to Chignik Bay, Alaska Peninsula. A special visit was made to the Government reservation on Afognak Island, where a salmon hatchery may be established. A visit was also made to Sand Point and Pirate Cove in the Shumagin Islands, where the needs of the cod fisheries were considered. The Alaska cod is very closely related to the Atlantic species, and the fisheries about the Shumagin Islands and in Bering Sea are of considerable and increasing importance. But to preserve them, artificial propagation will have to be resorted to.

The Alaska salmon fisheries are in fairly satisfactory condition, but cannot long so remain under existing conditions.

Most of the regulations governing the fisheries are observed, but some of them are wholly impracticable and cannot be enforced. This is particularly true of the one requiring the canning companies to maintain hatcheries. The artificial hatching of salmon is the solution of the whole question, but it will have to be done by the U. S. Bureau of Fisheries and on a very large scale.

There are five species of salmon in Alaska, namely, the king or chinook, the red or sockeye, the coho or silver, the humpback and the dog. The largest and best of these is the king salmon, which reaches a maximum weight of 90 pounds. It is, however, the least abundant salmon in Alaska. It is found in numbers only in the larger rivers, such as the Yukon, Nushagak, Alek, and Taku. In southeast Alaska it is not at all common.

The most valuable salmon in Alaska is the redfish or red salmon. This is exactly the same fish that is called sockeye on the Fraser River and Puget Sound, and blueback salmon on the Columbia. It attains a maximum weight of 7 to 10 pounds. Its habits are peculiar in that it is not known to enter any stream which has not a lake somewhere in its course. It is abundant throughout southeast Alaska, about Afognak and Kadiak islands, the Alaska Peninsula, and especially in Bristol Bay. It is the most sought after of all the salmon. Its flesh is a rich salmon color, and makes a more attractive appearance when put in the can than any other species.

The next most desirable species is the silver salmon or coho, which is fairly abundant in southeast Alaska and south to southern Oregon. It attains a weight of 12 pounds, and is a good food fish. Its flesh, however, is not so red as that of the king or the red salmon. This species runs later than the other salmon. Perhaps the most abundant salmon in Alaska is the humpback, the smallest species of any, reaching a weight of 3 to 7 pounds, running a little later than the red salmon, and then literally swarming in all the streams however small. When sea-run the humpback is a trim looking fish, but at spawning time it develops an enormous hump on the back, its jaws become greatly distorted, and, withal, it presents a very unattractive appearance. The sea-run humpback, as a fresh fish, is delicious, being excelled, if at all, only by the king. Humpback bellies are a great delicacy, and great quantities are now salted every year. Of all the Pacific Coast salmon the humpback is the one most desirable for introduction on our New England coast. As a fresh fish it would soon be in great demand in the markets of Boston, New York and other large Eastern cities. As a canned fish it is inferior to the king, red and coho. The dog salmon, the remaining species, is the least valuable of any, albeit, when sea-run, it is a beautiful fish, not a whit less attractive than the king. But even then its flesh is spongy and pasty; and as the spawning season approaches, the dog salmon becomes repulsive in appearance. His jaws become hooked, great fang-like teeth appear, the body becomes blotched and splotted with dark and dirty red, and the flesh becomes unpalatable. Until recently this species was not canned at all, and even now it is not extensively used. As a salted fish it is held in high esteem by the Japanese, and a market is developing in Japan for our salted dog salmon.

In Alaska the trade names under which the different species of salmon are canned are as follows: The king is labeled "King Salmon," or "Spring Salmon," the redfish is called "Red Salmon," "Red Alaska Salmon," or

some variation of which the word "Red" is always a part; the silver salmon is usually "Coho," or "Medium Red," the humpback is called "Pink Salmon," and the dog salmon is "Chum." Not infrequently the inferior grades are put up under fictitious labels, in many cases merely deceptive, in others actually false.

While the pack of salmon in Alaska this year exceeds 2,000,000 cases, valued at more than \$8,000,000, it is somewhat less than that of 1902. This large pack was secured only through unusual energy and persistence on the part of the cannerymen, and it is of vital importance that the Government take steps at once to preserve these important fisheries.

BARTON WARREN EVERMANN.

Sawdust and Fish.

BY A. P. KNIGHT, M.A., M.D., PROFESSOR OF ANIMAL BIOLOGY, QUEEN'S UNIVERSITY, KINGSTON.

(The following report on the effects of sawdust on fish relates to experiments undertaken by Professor Knight, at the suggestion of Professor Prince, Fish Commissioner for the Dominion of Canada.)

The source of the poison given off by sawdust is undoubtedly to be found in the contents of the wood cells. Sugar, starch, oil, resin, gum, jelly, alkaloids, and acids are all examples of material stored in different parts of plants.

In the older parts of trees the protoplasm and sap disappear completely from the cells, and they may then contain nothing but the stored material. In the pine family there is stored in the wood and bark cells an abundance of crude turpentine and resin. The Norway spruce of Europe furnishes in this way turpentine and Burgundy pitch. The yellow pine of the Southern United States yields spirits of turpentine by distillation of the crude turpentine which runs away from the tree by cutting into it. The residue after the distillation is resin.

Now, the poisonous material in sawdust must be either the cell wall or the stored material. It cannot be the cell wall, for this is just the wood fibre or material used in making paper, and pure paper is certainly not harmful to fish life. The poison can scarcely be anything else than the turpentine and other substances stored in the cells.

Different trees, such as tamarack, pine, cedar, spruce, etc., generate and store different kinds of reserve material. When a log from one of these trees is cut into boards, the sawdust gives off proportionately much more poisonous matter than the slabs, edgings and bark. The reason of this is easily understood. As each cell or vessel is microscopic, and contains only a very small quantity of poison, and as the cell wall must be broken open in order to let out the contents, it follows that the greater the number of cells that are opened, the greater will be the quantity of turpentine, resin, etc., poured out. Hence, a saw log converted into sawdust, or ground into shreds, as in a pulp mill, gives out the maximum of poison; whereas a similar log sawn into boards, edgings and slabs, will give out a much less quantity. The minimum will be given out by a saw log floating in the water.

There are other industries in Canada which in preparing their products for market grind up plants and trees, and thus let out their cell contents. One of these is the pulp industry—likely to become very extensive in the near future. Two processes are in vogue in this industry. In one, the logs are macerated with chemicals, the mills being known as sulphite mills. In the other process, the logs are ground into shreds in what are known as mechanical mills. Both processes liberate the greatest possible quantity of stored material from the wood cells, and if this material is equally poisonous with that liberated from sawdust, then the waste water discharged from a pulp mill should be much more poisonous than from a sawmill. The St. Andrew's experiments determined the percentage of poison from a sulphite mill which is fatal to fish life, but, so far as I know, the percentage of poison from a mechanical mill has never been determined. A provisional conclusion, however, may be based upon some of the experiments to be described later in this paper.

The experiments hitherto described would seem to indicate that some considerable time was required for the water to dissolve out the poisonous extracts from white pine sawdust, but such is certainly not the case.

Millmen and anglers alike testify that many kinds of fish are taken by hook and line at mill-ends, no matter how excessive the sawdust may be. The sawdust does not kill the fish so long as there is a rapid and abundant flow of water. Why do fish thus congregate at mill-ends? To answer this question we must remember two things: first, rapidly running water is better aerated than sluggish water; and secondly, some fish, such as trout and salmon, ascend streams until they reach suitable spawning grounds, or are stopped in their ascent by high falls or milldams. In ascending a river these fish are but obeying a law of their nature; in congregating at mill-ends they are equally obeying a law of their nature, and are instinctively seeking water which furnishes their blood with a plentiful supply of oxygen. This instinct is well illustrated in one of his experiments. The experiment was repeated a number of times, and in every instance the fish discovered where the fresh water came in. In one instance, in order to get close to the incoming water, a minnow stood on its head for fifteen minutes with more than half of its body buried beneath the sawdust. It was thus acting under the impulse of two fundamental instincts, viz., the instinct to avoid poisoned water on the one hand, and to seek fresh water on the other. The experiment seems to throw light upon the experience of anglers who have found that trout desert the main stream when saw mills are running, and betake themselves to the unpolluted branch streams lower down.

Reference has already been made to the fact that black bass fry, minnows and perch, when placed in an aquarium, invariably avoided the poisonous sawdust water at the bottom. Having sunk into it once or twice, it was found almost impossible to drive them into it again. Here was a conflict between two fundamental instincts. On the one hand was the natural in-

stinct to hide in deep water; on the other hand, the equally natural instinct to avoid the poisonous solution at the bottom. Which instinct would the fish obey if compelled to make a choice?

The following experiment was designed for the purpose of seeing which instinct was the more powerful, and for the further purpose of imitating what might possibly occur in a stagnant pool along the course of a sawdust polluted stream.

A glass aquarium 12 in. x 8 in. x 6 in. was placed in a much larger vessel and a mixture of ice and salt packed in the latter so as to surround the aquarium. The aquarium was then half filled with white pine extract which had been forming for three weeks, and which killed adult fish in from one to three minutes. After the extract had been cooled down to 8° C., tap water at the temperature of 13° was slowly admitted to the aquarium so as not to disturb the underlying poisonous water. The tap water, being warmer, floated clear and transparent on the dark purplish extract below. The clear water entered and left the aquarium at the rate of 150 c.c. per minute.

At first two minnows were placed in the aquarium. They at once dove to the bottom, encountered the poisonous water, immediately came up again, repeated the operation a few times, and finally remained swimming about in the clear water. Three black bass fry, liberated one after the other, went to the bottom and never came up—suffocated and poisoned in the dark stagnant water at the bottom. Of two other minnows dropped into the aquarium, one large one never came to the surface; the other joined its fellows in the clear water above. All three soon found the end at which the fresh water was entering and remained there facing the stream.

This experiment shows what might possibly happen in pools partially filled with sawdust. Wood extracts would form, and being cooler and heavier than the clear water, would lie at the bottom of the pool. Of course, fish already in the pool would be driven away, but those coming up or down stream through shallow stretches, and trying to hide in the deeper waters of the pool, might be suffocated or poisoned.

One objection frequently urged against the practice of throwing sawdust into streams and rivers is that the decaying sawdust imparts such a disagreeable odor to the water that sensitive fish are driven away to other waters not so polluted. It seemed to me, therefore, that some progress might be made towards a definite conclusion in this matter, if sawdust were allowed to stand for several weeks in an aquarium and tested from time to time as to the changes going on in it, and the influence of these upon fish.

With this end in view about 1000 grams of white pine sawdust were placed in an aquarium three feet four inches long, fifteen inches wide, and filled up to sixteen and a half inches deep with fresh water. This was done June 24. No water was allowed to enter or leave the vessel. No direct sunlight fell upon it.

The usual results followed, viz., a well defined layer of pale, yellow water one and three-quarter inches deep formed in a few hours and lay at the bottom. On top of this was the perfectly clear layer about fifteen inches deep.

After soaking for two days, bubbles of gas began to rise to the surface of the water, but no attempt was made to analyze it. The bottom yellowish layer had become so dense that no object could be seen across it—a thickness of fifteen inches. Its upper surface was sharply marked off from the overlying transparent water by a thin grayish layer. Microscopic examination of this layer showed it to be swarming with bacteria.

At the end of a week, only about an inch at the bottom had retained the original yellow color; the next inch had changed to a yellowish brown; then came a grayish layer about one-sixteenth of an inch thick; above this, what had at first been fourteen inches of perfectly pure water had turned to a dark gray, though still quite transparent. Black bass fry placed in the aquarium at this time at first sank to the bottom, but after meeting the poisonous extract once or twice could not subsequently be driven into it. On the contrary they swam along the top with their nose just touching the surface of the water, and behaved as if suffering from lack of air. They lived only about two hours.

Four days after this, black bass fry placed in the upper fourteen inches lived only about one hour. They also swam along the surface and appeared to be gasping for air. That they were suffocating in both cases was proved by the fact that when fry were placed in a wash bottle of this water with air bubbling through it, they lived on for twenty-four hours, and were then apparently well and exceedingly active. On being transferred from the wash bottle to the aquarium the animals at first plunged downward to the bottom, paused there a moment, but soon came toward the surface breathing very rapidly. Evidently they were suffering from lack of oxygen. They swim along the top with noses upward and body inclined at an angle of about thirty degrees with the surface. Gradually they tire; sink toward the bottom; rise again; swim convulsively toward the surface; jump clear out of the water with gaping mouth; become exhausted by their convulsive efforts and finally sink to rise no more. Of all the fish killed in this extract not one ever rose to the surface after death.

It would be difficult to say whether this experiment throws any light upon a point much discussed in the literature of sawdust. The point is this: if sawdust kills fish, why are they not found dead in considerable numbers along the course of the stream? In my experiments the dead bodies of the fish never rose out of the poisonous liquid.

However, the connection between a few links in the chain of animal life was apparent enough, viz., wood extracts supported bacteria, bacteria supported mosquito larvæ, and these again (after aeration of the water such as would occur in running water) supported fish life. These observations dispose to some extent of the oft repeated charge against sawdust that it destroys the food of young or newly hatched fish. When minnows relished mosquito larvæ as food, and I fre-

quently saw them eating the larvæ, it requires no great stretch of the scientific imagination to understand how fish fry of different kinds, such as trout and salmon, might subsist upon the larvæ of mosquitoes and other aquatic insects, these latter in turn subsisting upon bacteria, and the bacteria subsisting upon the organic matter derived from the decaying vegetation of the forest.

Another thought comes up in connection with the presence of organic matter in streams and rivers. The organic matter which passed into a river when Canada was covered with forest must have been quite different in character from that which this same stream receives today from the vegetation of the farms along its valley. The surface drainage from a forest must differ in kind from the surface drainage of a farm; and the bacterial life in each must differ also. Moreover, the waters of our smaller streams were, years ago, shaded by trees, and the varieties of their bacterial life must thus have been quite different from the bacterial life in sunlit streams of today. Consequently, it may fairly be argued that the insect life, in and along the streams of an agricultural district, differs both in kind and number from what characterized these same streams 100 or 200 years ago. And if larval and adult insect life has dwindled or disappeared, so must the fish life which subsisted upon it.

The Anglo-Saxon has always been a disturbing factor in the balance of life. Forests, game and fish all disappear with his arrival. To get good fishing or good hunting nowadays one must travel back to unsettled districts. No one expects game to be plentiful along the shores of Lake Ontario, but many people are amazed that fish are not abundant in it. They still hug the pleasing delusion that if brooks have been overfished, the fish hatchery can re-stock them. But with the disappearance of our forests it is exceedingly doubtful whether we can ever again, by all the help of hatchery, overseers and fish commissioners, re-people the streams which have been depleted by man through over-fishing and deforestation. He has upset the balance of life; it can only be fully restored by a return to primitive conditions. When game, therefore, becomes plentiful on the streets of Ottawa city, fish will be equally abundant below the saw mills of the Chaudiere Falls.

Such, at least, is the conclusion to which my experiments point, notwithstanding the indisputably poisonous effects of strong solutions from sawdust near the source of pollution. As I have already pointed out the question of whether any particular stream is sufficiently polluted with sawdust to kill fish life is simply the question of determining whether enough sawdust is passed into the stream to poison its waters. The forestry engineer will soon be trained to determine the strength of sawdust solutions, and will then be able to settle this question of pollution beyond the possibility of doubt.

At present, however, a final judgment cannot be pronounced upon the poisonous effects of sawdust. These effects must be studied near the mills and along the sawdust beds of our rivers. A three weeks' study of the Bonnechere river, a tributary of the Ottawa much polluted with mill rubbish, led me to modify very considerably the conclusions which I had based upon my laboratory experiments. I visited the mill, fully expecting that not one fish could survive in such surroundings. But pike were abundant for miles below the mill, and fish (chub) could be caught any day along the side of the submerged driftwood. Stranger still, the fish so caught lived for three hours in a pailful of sawdust water drawn from the very center of a sawdust bed. A few brook trout had been caught earlier in the season just below the mill when it was running. At the date of my visit, August 20, 1902, the mill had been closed for seven weeks and no sawdust was then passing into the river.

Of course, these figures are mere approximations, but they point unmistakably to the conclusion that the sawdust poured into the Bonnechere river is not destroying its fish life. Moreover, in Golden Lake, an expansion of this same river, and ten miles above any saw mill, lake trout used to be very abundant. Every October large numbers were caught in nets along their spawning beds. Now these spawning grounds are reported to be deserted by the fish, and certainly sawdust cannot be blamed for their disappearance. Higher up the river, in Round Lake, the October fishing is still good, solely because there are fewer settlers and less fishing.

1. Strong sawdust solutions, such as occur at the bottom of an aquarium, poison adult fish and fish fry, through the agency of compounds dissolved out of the wood cells.

2. The overlying water in such an aquarium does not at first kill fish. After about a week it does kill, but solely through suffocation, the dissolved oxygen having all been used up.

3. Bacteria multiply enormously throughout all parts of such an aquarium, and through oxidation change the poisonous extracts to harmless compounds. Mosquito larvæ live on the bacteria. No doubt, in natural pools, other aquatic insect larvæ live on bacteria also.

4. Subsequent aeration and sedimentation of sawdust water purify it, so that fish can live in it without injury.

5. Since adult fish and black bass fry both refused to be driven into pine extracts in the bottom of an aquarium after they had experienced its poisonous effects, we may infer that fish would desert a river much polluted with sawdust, going down stream and into tributaries to escape from the disagreeable influence of sawdust extracts.

6. No stream can be pronounced off hand as poisoned by sawdust. Each stream must be studied by itself and the varying conditions must be thoroughly understood before a judgment can be pronounced. The chief things to be considered are (1) the quantity of sawdust, and (2) the volume of water into which the sawdust is discharged. Subordinate conditions are the rapidity or sluggishness of the stream, the amount of sunlight or shade, and the character of the water, whether from agricultural lands or from primitive forests.

7. Further observations and studies along sawdust polluted streams and rivers of Canada are urgently needed before more definite conclusions can be reached.

Lake Champlain Pollution.

By the time this issue of *FOREST AND STREAM* is in the hands of its readers, the report by Professor Landreth, consulting engineer of the State Board of Health, in regard to the much-discussed pollution of the waters of Lake Champlain by the pulp mills in that region, will probably have reached the proper State executive officials, and its context will be made public. The report, which has already been much delayed, may, however, be held back for several days yet.

While Prof. Landreth refuses to disclose the nature of his report until its contents shall have been made public by the proper authorities, persons in a position to speak with knowledge on the subject declare that the report will be to the effect that the mills are polluting the waters of the lake, killing the fish, flooding the shore lines with noxious slime, and in other ways transgressing the law.

It appears that industrial enterprises representing many millions of dollars are threatened by the report. If the present laws in relation to the pollution of the waters of the State are as a result enforced, the offending mills will be compelled either to close or adopt other methods of getting rid of their chemical refuse now dumped into the lake waters, and scores of mills in all parts of the State may be similarly affected.

This would affect millions of dollars of invested capital and the Legislature will doubtless be petitioned by the mill owners to pass new laws to protect their interests, and these efforts will be actively combatted by those interested in the present enforcement of the law against the pollution of the waters of the rivers, lakes, streams, etc., of the State.

Mr. Edward Hatch, Jr., of the firm of Lord & Taylor, leader of the residents and property holders about Lake Champlain engaged in the fight against the owners of the pulp mills, declares that he and those interested with him will fight to the end against all legislation that may be made favoring the pulp mill nuisance, and that he will be at hand at Albany with injunctions from the Supreme Court to carry the issue to its limit.

To a citizen living in the village of Keeseville, located on the Au Sable River, Attorney-General John Cunneen writes:

"I have your favor at hand, wherein you call my attention to the alleged pollution and unhealthy condition of the Au Sable River, which passes through the village of Keeseville, which pollution, it is said, has been brought about by the discharge of sludge acid and refuse from certain pulp mills, and you request me, as Attorney-General, to take some action to prevent the continuance of this wrong.

"The health board of your village and the State Board of Health are vested with ample powers to redress the injury and prevent the continuance of the wrong.

"The Supreme Judicial Court of Massachusetts has declared, and our own Court of Appeals adopted and approved the declaration, that the courts will not, on the application of the Attorney-General, interfere where the obstruction of the rights of the public is of such a character that it may, with equal facility, be removed by other constituted authorities and public officers."

This letter plainly indicates the attitude of the Attorney-General on the subject, and indicates also that if Prof. Landreth's report is a condemnatory one, it is the clear duty of the State Board of Health and the local health officials acting under its jurisdiction, to take the matter in hand and see that the law against the pollution of the waters of the State is enforced.

Dr. Charbonneau is the local health officer at Keeseville, and Dr. Barton at Willsborough, in the heart of whose districts the pulp mills are located. Although both officials are known to be on friendly terms with the owners of the pulp mills, they are accredited with being men of such high moral and professional worth that once their duty is pointed out to them by the State Board of Health on taking action on Prof. Landreth's report, they will act promptly in the performance of their duty.

Dr. P. Lewis, President of the State Board of Health, when seen by a *FOREST AND STREAM* representative yesterday, stated that if Prof. Landreth found that the mills were violating the law he would at once notify the local health authorities to carry the law against the mills into execution. This means, he said, that the mill owners would be given a reasonable time to abate the nuisance, and failing in this, summary action would be taken to compel them to cease operations.

"Contrary to general report," said Dr. Lewis, "it is not Governor Odell but myself who will take official action when Prof. Landreth shall have made his report." This remark of Dr. Lewis was quite in line with Attorney-General Cunneen's view of the matter, and in conformity with the most recently enacted law.

In speaking of the subject yesterday with a representative of *FOREST AND STREAM*, Gov. Odell declared that the matter was a grave one, and that he was in doubt as to the best method of its satisfactory solution. "Numerous complaints," said he, "have reached me about the pollution of the waters of Lake Champlain by the pulp mills. As a result, I have had an examination of the waters made by Prof. Landreth, whose report, I understand, will be turned in to the officials of the State Board of Health in a day or two.

"The subject is a very broad one, and fraught with public interest. It is a matter that I have given considerable attention. It may be that the mills have for so many years been dumping their refuse into the waters of the State that mere time itself will keep them from coming under the ban of the law. On this point I am not quite sure.

"If State proceedings were begun against the pulp mills in the Lake Champlain region, we would doubtless be compelled to take similar action against numerous mills in all parts of the State that may be transgressing the law in this particular. Carried into immediate effect, such action would, I fear, bring about a crisis in the milling interests of the State of wide reaching effect.

"As I have said, it is a matter which I have given grave concern. Reports and complaints have reached me about various municipalities on the Hudson which are declared

to be menacing the public health by their wholesale, so to speak, pollution of the river by their sewerage, etc., and urging that they be compelled to adopt disposal plants. It may be that in a comparatively short while every city, town and village in the State including all mills, factories, etc., now emptying their sewerage and refuse into the waters of the State, will have adopted some such measure.

"As is well known, I am decidedly opposed to all unnecessary and unlawful pollution of the waters of the State, and in reference to the Lake Champlain pollution matter in particular, wish to state that I will be glad to meet Governor McCullough, of Vermont, more than half way in whatever efforts he may see fit to make in the way of protecting that magnificent body of water from pollution by the mills along its banks."

Mr. Hatch said yesterday that he had received a number of letters from old residents and well-known fishermen who lived about the borders of Lake Champlain, in which they declared that very few fish were caught in the lake nowadays, in contrast to the superb fishing the lake afforded only a few years ago. The absence of the fish, they assert, is due to the chemical refuse dumped into the waters of the lake by the pulp mills. These letters will be embodied in the form of affidavits, and the writers of them will back their statements in court when called upon to do so. The whole matter of the pollution of the waters of Lake Champlain promises some very interesting developments during the present week.

October Bass.

SAYRE, Pa., Oct. 13.—Bass fishing in local waters has been practically at a standstill for some time past owing to the heavy rains and consequent abnormal condition of the Susquehanna and its tributaries.

The exceptionally fine season of weather now prevailing, with clear frosty nights, and days which are a delight, are rapidly developing ideal bass fishing conditions, and presently we should hear of plenty of bass being taken.

Reports from Cayuga Lake are especially alluring, and indicate that excellent bass, pickerel, pike and muscalonge fishing is being enjoyed at Canoga, Union Springs and Cayuga village. Ithaca anglers are also taking some nice bass along the east shore of the lake within two or three miles of the university city.

Life has few pleasanter experiences than idling in an easy boat over bass waters, with the soft winds of October gently stirring the air and a thousand lovely tints of autumn appealing to the soul of the angler. Sure enough, it is not all fishing to fish. There are sweeter and far more delightful compensations than mere acquirement of a well filled creel.

The glorious free air out of doors under the deep blue sky, never so blue as now, is an exhilaration in contrast to which life within brick walls and amid the rude turmoil of industry is small and uninviting.

In connection with this subject of bass fishing, an Athens paper alludes to the seven pounds and fourteen ounces small-mouthed black bass caught from the Susquehanna River last fall by Wm. H. Thomas, of Owego, N. Y., as the "largest specimen of its species ever known to have been captured." The writer has no data at hand upon which to base a contradiction to this claim, but thinks that *FOREST AND STREAM* has record of a larger black bass having been taken, and its weight amply verified.

This subject of large bass is an interesting one, and if Mr. Thomas has really caught the largest "specimen of its species" the record should be clearly established and widespread credit attached to the achievement. What have the readers of *FOREST AND STREAM*, or its editor, to say concerning Mr. Thomas' 8 pounds 14 ounces black bass as a record breaker?

M. CHILL.

Transportation of Live Fish.

ACTING upon the principle that fish live with ease in any water if it is supplied with oxygen, European exporters are beginning to use metallic tubs to which oxygen generators are affixed in such a manner as to feed the water regularly with the gas, which escapes when the pressure surpasses that of the atmosphere. Recently by this means 40,000 trout were exported from Switzerland to England, Germany and Austria, of which number only 400 died.—Thornwell Haynes, Consul, Rouen, France, Sept. 3, 1903.

Pointer Club Entries.

Editor Forest and Stream:

The following are the entries in the several field trials stakes of the Pointer Club of America, which will be run at Holmdel, N. J. Commencing Nov. 16, exclusive of the Members' Stake, which closes before starting, the number of entries is 44.

The Field Trial Committee desire to inform members that Matawan will be the alighting station of New Jersey Central R. R., instead of Hazlet, as previously announced, inasmuch as better stage and livery accommodations can be had at Matawan. The round trip fare by stage, including the conveyance of dogs from Matawan to Holmdel, will be \$1. The railroad excursion fare from New York to Matawan is \$1.25. The proprietor of Union Hotel at Holmdel will be prepared to accommodate all who may attend the trials.

All communications for *Forest and Stream* must be directed to *Forest and Stream Pub. Co.*, New York, to receive attention. We have no other office.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.

Second prize, \$50.00.

Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

Constance—Auxiliary Schooner.

THE auxiliary schooner Constance was designed for Mr. W. Amory Gardner by Messrs. Small Brothers under the direction of Captain E. F. Small. She was built last winter by Messrs. Rice Brothers, of East Boothbay, Maine. Captain E. F. Small has been Mr. Gardner's sailing master for seventeen years. He was in charge of Rebecca for two seasons and commanded the old cup defender Mayflower from 1890, when Mr. Gardner purchased her, up to last season, when she was sold. Captain Small got out the model of Constance, and Messrs. Small Brothers faired up the boat's lines and worked out her arrangements and fittings under his superintendence.

Constance was designed solely for a cruiser, consequently seaworthiness and comfort were considered of first importance. Although speed was a secondary consideration, she demonstrated last season that she was a smart boat, and showed a very fair turn of speed both in light as well as in heavy weather.

Her dimensions follow:

Length—	
Over all	125 ft.
L.W.L.	85 ft.
Overhang—	
Forward	16 ft. 6 in.
Aft	23 ft. 6 in.
Breadth—	
Extreme	24 ft.
L.W.L.	23 ft.
Draft—	
To rabbet	8 ft. 6 in.
Extreme	12 ft.
Board down	20 ft.
Freeboard, top of rail—	
Bow	8 ft. 6 in.
Least	5 ft. 9 in.
Taffrail	6 ft. 6 in.
Displacement	138 tons
Ballast—	
Outside	40 tons
Inside	10 tons
Area working sails	8,285 sq. ft.
Mainmast—	
From stem at L.W.L.	45 ft.
Deck to hounds	68 ft.
Masthead	13 ft.
Maintopmast	32 ft.
Main boom	74 ft.
Main gaff	44 ft.
Foremast—	
From stem at L.W.L.	16 ft.
Deck to hounds	64 ft.
Masthead	11 ft.
Foretopmast	28 ft.
Foreboom	27 ft. 6 in.
Foregaff	29 ft. 6 in.
Bowsprit—	
Over all	31 ft.
Outside gammon iron	23 ft.
Spinnaker pole	61 ft.

Constance is built entirely of wood, and is splendidly put together. Her approximate cost was about \$40,000. In her construction a novel feature was introduced. She has a single keel 55 ft. in length which is 27 in. by 30 in. instead of the usual keel and keelson. The stem, sternpost and horn timber all extend down to the keel and are mortised into it. Keel, stem, sternpost, frames, deck beams, clamps and stringers are of white oak. The frames are spaced 20 in. on centers. Amidships they are

CONSTANCE—AUXILIARY SCHOONER—SAIL PLAN.
Designed by Small Brothers for W. Amory Gardner.

sided roim. and molded 5in. at the head and 7in. at the foot. For about one-third of the distance forward and aft they are sided gin. and molded 5in. at the head and 6in. at the foot. The deck beams are spaced 24in. on centers, the main beams being 7in. by 8in. and the regular beams 5in. by 5in. The shelf will be 6in. by 8in. The planking is of yellow pine 2 1/2 in. thick and the deck planking is of white pine 2 1/4 in. square.

The forward overhang is strongly trussed and braced as a precautionary measure against strains. Diagonal steel straps are placed on deck to give additional strength and stiffness. The knees are of hackmatack. All coamings, hatches and companionways are of mahogany. The waterways and rails are of teak, while the stanchions are of oak.

Although Constance is a centerboard boat, her board does not interfere with her accommodations in any way, as it houses under the cabin floor. The main companionway leads to a storage from which a passage runs forward and aft. The engine room, which is placed under the companionway, is 5ft. wide and 10ft. long. The engine room can be reached directly from the deck or by a door which opens from the steerage. On the starboard side of the steerage is the owner's suite of rooms, which consist of two cabins and a bath room. The first room reached is nearly 8ft. long and contains, besides a bureau and set wash basin, a wide sofa with a berth behind. Just forward of this room and opening from it is another cabin over 8ft. long. These rooms are finished in mahogany and white enamel, and are fitted up in very much the same manner. Port holes give the necessary light and air. The bath room is reached from the forward cabin of the owner's suite. The bath room contains a porcelain tub, marble wash basin, and a patent closet. The owner's quarters can be used in suite or separately as both cabins can be made independent of one another. On the port side of the steerage are two staterooms and a toilet room. Both of the staterooms are of ample size and are finished in mahogany and white enamel, as are all the cabins and staterooms. Going aft the passage opens into the ladies' cabin, a very commodious room 7ft. long and running the full width of the vessel. On either side are sofas behind which are wide berths under which are drawers and lockers. A bureau is placed against the after partition, and on each side are easy chairs. Connecting with the ladies' cabin on the starboard side forward is a private bath.

Leading forward from the steerage the passage gives access to the main saloon, which is 12ft. long and extends the full breadth of the boat. On either side is a long sofa, back of which are shelves. On the port side there are a linen closet and a china closet, and on the starboard side there are a clothes closet and a bookcase. At the after end of the saloon is a fireplace, while a large built-in sideboard is at the forward end. Overhead is a large skylight and there is a deadlight in each side.

On the port side of the saloon is a door which opens into the galley, which is about 8ft. long and runs the boat's full width. The galley and the rooms opening

from it are finished in butternut. Aft of the galley on the port side is the steward's room, while on the starboard side is a room for the two cooks. On the starboard side are a space for stores, dish locker, shelves and a large locker. On the port side are four dish lockers, a dresser, sink and the range. An iron ladder leads from the galley to the deck. The ice boxes and refrigerator are located in the galley. The main ice box holds over a ton of ice, which is lowered into it from the deck. A smaller ice box is accessible from the galley. Forward of the ice box is the refrigerator, while there is also a cold storage space beneath. There is a toilet room on the starboard side forward of the galley for the cooks and stewards.

Forward of the galley on the port side is a stateroom for the two quartermasters. The forecabin is roomy, and there is ample accommodation for the eight men carried. The crew have a wash room, toilet room and lockers for their dunnage.

Well aft, and separated from the owner's and guests' quarters by a bulkhead, are the captain's and mate's staterooms, with entrance by a companionway just forward of the wheel, which leads to a steerage. The officers have a private toilet, and their cabins are finished in butternut.

The gasoline tank has a capacity of 300 gallons, and is located in the lazarette, which is aft of the owner's quarters. The water tanks are of 1,000 gallons capacity. The yacht is steered with an Edson screw gear.

Her motive power is furnished by a 40 horse-power Standard engine, which drives the boat in smooth water at a rate of over five miles.

The yacht carries a crew of sixteen men all told. Beside the captain and the mate there are two quartermasters and eight men before the mast. Then there are two stewards and two cooks.

Although Constance is the largest vessel yet designed by Small Brothers, her success shows clearly that they are fully qualified to handle this kind of work.

Boston Letter.

Boston, Oct. 26.—At the present time the yachtsmen of Massachusetts Bay are not particularly active in placing orders for new boats in the new classes that have been recently adopted by the Yacht Racing Association of Massachusetts. They are giving those rules their closest attention, however, and it is likely that after the rules have been gone over carefully in every detail, orders for new boats will be forthcoming. Some time ago Messrs. Burgess and Packard were commissioned to design a 30-rater, if the class should be accepted, and it is quite possible that this boat will materialize shortly. Mr. E. A. Boardman has an order for a keel 15-footer for Mr. J. W. Olmstead, of the Boston Y. C. This boat will be built by Shiverick, of Kingston.

Several yachtsmen, members of the Dorchester Bay clubs, and of the Winthrop, Quincy and Lynn Y. C.'s,

are desirous of having a class of 15-footers in which ballast may or may not be carried, according to the ideas of the owner. While there has been no direct promise of any certain number of boats for such a class, should one be formed, it is understood that there are quite a number who stand ready to build. It is understood that these yachtsmen do not wish an entirely unrestricted class, but do want the privilege of racing without ballast if they so desire. There has been some talk of forming an association similar to those governing the 18ft. knockabouts and 22-footers should the Y. R. A. not feel disposed to provide rules for the class. In such case, if sufficient number of boats should be built to warrant it, there is little doubt but that the Y. R. A. of M. would adopt the class for the benefit of those racing in it.

Early in the fall it looked as though the cruising yachts would make another record breaking stay in the water before being hauled out for the winter; but the north-easter of a few weeks ago dampened the ardor of the late stayers and now there are few yachts to be seen at their moorings. Even at City Point, where they remain until very cold weather, they are being hustled off to the yards. The yards and basins throughout the district are being rapidly filled up and it will not be long before the last pleasure craft will be under cover.

Mr. J. Malcolm Forbes' big sloop Volunteer, defender of the America's Cup in 1887, arrived at Lawley's basin last Friday from Naushon Island. A number of her bow plates have become corroded to a great extent and these will be replaced during the winter.

At Lawley's an 18-footer, designed by Mr. B. B. Crowninshield for Mr. L. M. Chase, of the Boston Y. C., is being laid down. A 50ft. waterline centerboard schooner, designed by Mr. Fred D. Lawley for Mr. J. H. Cromwell, of New York, is also being laid down. In the west shop the 70ft. steel auxiliary schooner, designed by Messrs. A. Cary Smith and Barbey for Mr. W. H. Alley, has been plated and the cabin work is being put in.

The 50ft. auxiliary yawl, Vagabond, formerly owned by the late Mrs. Charles DeBlois Gibson, and in which that devoted yachtswoman received injuries from an explosion resulting in her death, has been rebuilt. She is now owned by Mr. Robert Saltonstall, of the Eastern Y. C., who will probably give her another name.

The house committee of the South Boston Y. C. announces a schedule of fall and winter social events as follows: Evening of October 29, dancing for members and women guests; evening of November 19, athletic entertainment and smoke talk; Thanksgiving Day, open house; evening of December 10, whist party; Christmas open house; December 31, dancing and watch party.

The fourth general meeting of the Eastern Y. C. for 1903 will be held at the house of the St. Botolph Club, Boston, Tuesday evening, October 27, at 8:30. The following nominating committee has been named by the commodore, subject to confirmation at this meeting; Messrs. J. Malcolm Forbes, Gordon Dexter, Russell G. Fessenden, Walter I. Badger, Elmer H. Harding.

At a regular meeting of the Boston Y. C. to be held at

CONSTANCE—AUXILIARY SCHOONER.

the club house on Rows Wharf, Wednesday evening, October 28, at 7:30, action will be taken on two amendments to the by-laws. The first is to increase the membership of the nominating committee from five to seven. The following have been named on this committee, subject to confirmation at this meeting: Messrs. Clarence W. Jones, John A. Stetson, Jacob A. Barbey, Jr.; Herman W. Friend, Sumner H. Foster, Charles H. Cross 2d, and B. S. Permar. The second amendment relates to the dues of members of class A, who were members of the old Boston Y. C., and under the present by-laws pay \$10 a year, and have the privileges of the City Point and Marblehead houses only. One amendment offered is to raise the dues to \$20 a year for this class, which is but \$5 less than is paid by members having full privileges. Another amendment fixes the dues at \$15. The meeting will determine by vote which of these shall be accepted by the club.

JOHN B. KILLEEN.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

The Country Club, of Detroit, has issued a pamphlet which contains a detailed account of the first series of races for the Country Club competitive cup held on Lake St. Claire on September 9, 10, 12. The little book is well gotten up and contains, beside a good account of the races, some excellent illustrations. The series of races were won by Columbia Y. C.'s representative, Little Shamrock.

King Edward of England has presented a cup to the Club Nautique de Nice which is to be called the King Edward VII. Mediterranean cup. The race will be open to yachts of all nationalities and be sailed from Nice to Gibraltar.

Mr. Edmund Randolph has purchased, through Messrs. Tams, Lemoine & Crane, the British built auxiliary bark White Heather. She is 220ft. over all, 180ft. waterline, 28ft. 6in. breadth and 16ft. 6in. draft. Mr. Randolph contemplates making a Mediterranean cruise in White Heather, and she will be entirely refitted under Messrs. Tams, Lemoine & Crane's direction. She will receive new decks and a new and larger boiler. A cold storage and ice-making plant and a ventilating system will be installed, and new plumbing will be introduced. The new electric plant will be most elaborate, and it will be used for lighting, heating, cooking and all hoisting.

The new auxiliary schooner Atlantic, designed by Messrs. Gardner & Cox for Mr. Wilson Marshall, and built by the Townsend & Downey Co., Shooter's Island, S. I., left New York on Saturday, October 24, for the trial trip. She will go as far east as Newport, and will then return to New York, where her interior fittings will be put in place. She is 189ft. over all, 135ft. waterline, 29ft. breadth and 15ft. draft. She is a centerboard boat, and is rigged as a three-masted schooner. She carries about 16,000 sq. ft. of sail.

The new schooner Ingomar, owned by Mr. Morton

F. Plant, is to be raced in English waters next season. She will be commanded by Captain Charlie Barr. She was designed and built by the Herreshoffs, and is 127ft. over all, 87ft. waterline, 24ft. breadth and 14ft. draft.

The fifth general meeting of the New York Y. C. was held at the club house, West Forty-fourth street, New York City, on Thursday evening, Oct. 22. The following nominating committee was appointed: Edward M. Brown, Lewis Cass Ledyard, C. Oliver Iselin, Seymour L. Husted, Jr., Charles Smithers, Philip Schuyler, J. Searle Barclay, Charles T. Minton, Robert Bacon and W. Butler Duncan, Jr.

Seventeen new members were elected.

A club station has been opened at San Juan, Porto Rico. This station will be in charge of Mr. Regis H. Post.

A committee of seven is to be appointed to revise the racing rules and report at the annual meeting, to be held in February. Another committee of five is to be appointed to draft resolutions of thanks to the syndicates and managing owners of the Reliance, Constitution and Columbia, and to the Government and naval officers for what they did for the recent races for the America's Cup. The reports of the committee on Cup challenge and of the Regatta Committee are now in the hands of the printer and will be sent to the members shortly.

The regular October meeting of the Yacht Racing Association of Long Island Sound will be held at the Arena, No. 41 West Thirty-first street, New York city, on Thursday, Oct. 29, 1903, at 8:30 P. M.

Amendments to the rules, providing for restricted classes of 15ft., 18ft., 27ft. and 32ft. load waterline length respectively, will be offered.

Other amendments will be offered as follows:

Rule II. To strike out the last sentence of the sixth paragraph of Section 3, beginning, "should the boom when in use," etc.

To strike out Section 9.

Rule III. To abolish the separate classifications of cabin and open sloops, and cabin and open catboats in the 25ft. classes.

To abolish the distinctive lettering of the catboat classes, and reletter such classes with their relative sloop classes.

Section 3. To strike out the words "December 1, 1898," and substitute therefor the words "January 1, 1899."

Section 5. To insert the words "or catboat" immediately after the word "yawl."

To strike out Section 6.

Rule XII. To amend by striking out the present rule and substituting the following: "Except when otherwise specified in the instructions, a race in any class in which no yacht has finished at 30 minutes after sunset, shall be declared off."

Rule XV. To strike out the last paragraph of Section 2.

To strike out Section 3 and substitute the following: "The Race Committee boat when at the finish line shall display a red ball. The signal to denote the con-

clusion of the race shall be the lowering of the red ball."

To add to Rule XV. a new section providing signals for postponing the start for half an hour, postponing the race for day, shortening the course, sailing the course in reverse direction, etc., etc. (in part now covered by Rule XIX).

To strike out Rule XIX.

The new home of the Hampton Roads Y. C., on Willoughby Spit, is nearly finished, and it will be opened on Nov. 10. Nearly \$22,000 have been spent on the club's new property, and about \$2,000 additional was expended in furnishing the building.

Captain Charles Barr was the guest of Mayor Weaver, of Philadelphia, on Oct. 23. At noon he was presented with a loving cup by a number of Philadelphia's business men.

Mr. Regis Post has sold his schooner Shawondasec, through the agency of Mr. Thomas A. St. Johnston, to Mr. James King Clark.

Messrs. Cousens & Pratt, the well-known Boston sail makers, have recently gotten out a very handsome little book called "Sail O!" It contains photographs of some eighteen successful racing and cruising boats for which they recently made sails. Letters from the owners of these yachts have been received by Messrs. Cousens & Pratt, and in them their work is given the most unqualified endorsement.

The steam yacht North Star, owned by Rear-Com. Cornelius Vanderbilt, New York Y. C., arrived at Queenstown on Oct. 25, from New York, after a passage of nine days and seventeen hours. She will proceed to Greenock, Scotland.

Captain Brown, who left Boston on August in the little sailboat Columbia III., has reached Funchal, Isl- and of Madeira, after a passage of 73 days. Captain Brown first put in at Halifax for supplies and left that port Aug. 26. On Sept. 6 the craft was capsized in a gale and Captain Brown was thrown overboard. After hours of hard work he righted the boat and got aboard. He had lost much of his provisions and three of his four casks of water. The British steamer Greenbrier sighted Columbia III. on September 17, and Captain Brown was taken on board. After being supplied with food, water and his reckonings, lat. 37.21 west, long. 42.45 west, Captain Brown resumed his voyage.

The Gardens of the Caribbees.

MENTION was made a short time ago in these columns of a new book recently written by Ida M. Starr—"The Gardens of the Caribbees." It is an account of a cruise made on a German steamer in 1901 to the West Indies and the Spanish Main while our soldiers were still occupying Cuba and Puerto Rico and before the destruction of Martinique by the eruption of Mont Pelee.

The writer addresses the following to the reader: "These sketches were written during a memorable cruise to the West Indies and the Spanish Main in the winter and spring of 1901. There has been no attempt to write a West Indian guide-book, but rather to give preference to the human side of the picture through glimpses of the people and their ways of life and thought. With this idea it was thought best to give attention only to such of the ports visited as were full of human interest and typical of the life about the Caribbean Sea.

There was a strong feeling that we were sailing in romantic waters, and there has been no desire to eliminate the element of fancy from these pages.

It may be of interest to remember that at no time since—and perhaps never before—could this voyage have been made under the same conditions. Since then man and the greater power of nature seem to have conspired to make much of this delightful region forbidding to strangers. Several ports have become dangerous because of fever and plague; proclamations in French and pronunciamientos in Spanish have adorned West Indian street corners; Haiti has reverted to its almost chronic state of riot and revolution; the Dominican Republic has again chosen a President whose nomination came from a conquering army; Venezuela has been full of alarms and intrigues; while already the Germans are beginning to show their hand in the Caribbean; Martinique and St. Vincent have been desolated by volcanoes then thought to be practically extinct; and of delicious St. Pierre there remains but a sadly sweet memory."

The story is most charmingly told, and from the time it opens when the writer is leaving New York on the steamer on a cold January day, it is full of interest and incident. Haiti is the first island visited, and the writer's impressions are delightfully described. After a short stop at Port-au-Prince the writer visits Santo Domingo. San Juan, Puerto Rico, is the next port touched at, and it is interesting to learn what great benefit the American influence has had on the city and the island.

After leaving the island of St. Thomas a stop was made at Martinique. This was before St. Pierre was wiped out by the eruption of Mont Pelee, and one gets a very impressive idea of the place and its people. Trinidad is the last place described in the first volume of the story, which is published in two parts.

Part two opens with a more elaborate account of Trinidad. After a trip through the Spanish Main (which is rich in romance, the very name suggesting pirates and buccaners), the main land of South America is reached. La Guayra, a famous port of Caracas, was the place where the writer first set foot on South American soil. From Caracas the country round about was explored, and a trip to Puerto Cabello was made.

The Dutch city of Willemstad, the capital of the Dutch West Indies, on the island of Curacao, was found to be a fascinating spot, where it seemed as if a part of Holland had been transplanted there, so pronounced was the Dutch feeling.

Kingston was found to be less attractive and interesting than many of the other places, and the writer says it is "dirtier and hotter and in every way more dull and uninteresting than Port of Spain." After a word about Cuba, the author closes with the story of Martinique since its devastation. The place as she saw it when it was in the height of its loveliness and as it now is.

The writer holds one's interest to such an extent that the reader feels as though he had actually made the cruise himself. The book is very attractively gotten up, and is well bound in green cloth. The half-tone illustrations, and there are many of them, are particularly good, and most of the photographs were taken by the author herself. L. C. Page & Co., 200 Summer Street, Boston, Mass., are the publishers.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Canoeing.

Prizes for Canoeists.

In order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.
Second prize, \$25.00.
Third prize, \$15.00.
Fourth and fifth, \$10.00 each.
Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. When practicable an outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in. While a chart will count in estimating the events of the log, it is not a necessary factor, and a log may be sent without it.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

CANOEING NEWS NOTES.

At the annual meeting of the Park Island Canoeing Association, held on Tuesday, October 13, the following were elected to serve for the next year: President, E. C. Hill; Vice-President, F. B. Yard; Secretary-Treasurer, W. A. Furman; A. H. Wood and W. A. Holcomb.

Rifle Range and Gallery.

The United States Revolver Association.

NEW YORK, N. Y., Oct. 23.—Appended is the official report of the annual championship match of the N. R. A.:

The annual championship matches of the United States Revolver Association for 1903 were held during the period of the meeting of the National Rifle Association, Sept. 2 to 12, inclusive. Arrangements were made to conduct these matches at Sea Girt, N. J.; Boston, Mass.; Chicago, Ill.; St. Louis, Mo., and San Francisco, Cal. The prize winners and order of the contestants in each match are as follows:

MATCH A—ANY REVOLVER.

Open to everybody; distance 50yds.; 50 shots on the Standard American target; 8in. bullseye, 10-ring, 3.36in.; any revolver; time limit, one hour; entrance \$5; any ammunition.

First Prize—The championship silver cup (value \$200), to be held by the winner until the next annual competition. Inscribed on the cup, in raised ornamental letters is "This cup represents the Revolver Championship of the United States of America." The name of the winner, the year and the score are also engraved on the cup each year.

To the winner is also awarded a gold medal (value \$25), with the same inscription on the reverse side as appears on the cup.

Second Prize—A silver medal, with inscription on reverse side.

Third Prize—A bronze medal, with inscription on reverse side.

A bronze medal of the same design is also awarded to all competitors making scores of 425 or better.

First Prize—J. E. Gorman, at San Francisco, Cal.:

MATCH B—ANY PISTOL.

Conditions same as Match A otherwise.

First Prize—The championship silver cup (value, \$175), to be held by the winner until the next annual competition. Inscribed

on the cup in raised ornamental letters is "This cup represents the pistol championship of the United States of America." The name of the winner, the year and the score are also engraved on the cup each year.

To the winner is also awarded a gold medal (value \$25), with the same inscription on the reverse side as appears on the cup.

Second Prize—A silver medal, with inscription on reverse side.

Third Prize—A bronze medal, with inscription on reverse side.

A bronze medal of the same design is also awarded to all competitors making a score of 435 or better.

MATCH C—MILITARY REVOLVER.

Open to everybody; distance 25, 50 and 75yds.; 5 consecutive strings of 5 shots at each range on the same target as Match A. Each string at each range must be shot within the time limit of 15 seconds, taking time from the command, "Fire." Misfires and shots lost on account of the arm becoming disabled while firing any string will be scored zero. If a shot is fired after the time limit has elapsed, the shot of highest count will be deducted from the score. No cleaning allowed. Arm any military revolver, or any military magazine pistol. Ammunition, the full charge service cartridge. The score must be begun at the shortest range, and must be completed on the same day. No sighting shots will be allowed after beginning the score. Entrance \$5; no re-entries.

First Prize—The championship silver trophy (a silver bowl, value \$450), to be held by the winner until the next annual competition. The trophy bears the inscription "The Military Revolver Championship of the United States of America." The name of the winner, the year, and the score are also engraved on the cup each year.

To the winner is also awarded a gold medal (value \$25), with the same inscription on the reverse side, as appears on the trophy.

Second Prize—A silver medal, with inscription on reverse side.

Third Prize—A bronze medal, with inscription on reverse side.

A bronze medal of the same design is also awarded to all competitors making scores of 535 or better.

MATCH D—MILITARY REVOLVER (RE-ENTRY).

Open to everybody; distance 50yds., 5 consecutive strings of 5 shots under the same conditions as Match C. Entrance \$1. Entries unlimited.

First Prize—A gold trophy (a laurel wreath surrounding a scroll, mounted on an ebony shield; value \$150). Between the scroll and the wreath is a ribbon on which, in raised letters, is "The United States Revolver Association." At the top of the scroll is engraved "Military Record Match" and the name of the winner, the year and the score for each year are engraved on the scroll below. This trophy is held by the winner until the next annual competition, and is to become the property of the competitor winning it three times.

Second Prize—A silver medal, with inscription on reverse side.

Third Prize—A bronze medal, with inscription on reverse side.

A bronze medal of the same design is also awarded to all competitors making a score of 190 or better.

A. L. A. HIMMELWRIGHT, Sec'y.

Greenville Shooting Park.

THERE was quite a bunch of revolver and rifle experts and novices gathered together on the Greenville range on Saturday of last week. The weather was clear and windy, with the temperature down to the point that makes one think of getting his top coat out of hock. Among the riflemen who were out for practice were L. P. Hansen, Dr. W. G. Hudson, O. C. Boyce, Harry Fenwirth, C. Bischoff, H. F. Barning, R. Goldthwaith, Major Brinkerhoff and Lieut. Oliver; the last two gentlemen are well-known in military circles as members of the Fourth Regiment, N. J. S. N. G.

The shooting was of an informal order, simply practice. The scores are appended, 10 shots, possible 250:

C. Bischoff 214, 209, 219.
Wm. A. Tewes 225, 209, 219.
H. F. Barning 215, 198, 216, 194, 216; total 1039.

Dr. W. G. Hudson 230, 216.

H. Fenwick 196, 202.

L. P. Hansen 212, 207, 213, 217; total 1056.

Among the group of revolver shooters were J. E. Silliman, A. P. Proctor, W. J. Coons, A. L. A. Himmelwright, and John A. Dietz. The shooting was on the 50yd. range, with the Standard American target. While there were not very high scores made, the general average was good. Scores, 10 shots, possible 100:

L. R. Piercy 91, 85, 92, 90, 89; total 447.

A. P. Proctor 87, 86, 81, 84, 85; total 424.

W. J. Coons 85, 79, 91, 83, 84; total 422.

A. L. A. Himmelwright 89, 88, 94, 88, 86; total 445.

J. A. Dietz 92, 86, 90.

J. E. Silliman 76, 83, 82, 84.

Miller Rifle Club.

At the weekly shoot of the Miller Rifle Club, held at headquarters, No. 423 Washington street, Hoboken, N. J., on Oct. 21, 10 shots, .22cal. rifles, distance 75ft., the following scores were made: C. Bischoff 246, D. Dingman 242, F. Unbehnen 241, O. Smith 239, D. Miller 238, H. Bohn 234, R. W. Evans 234, P. Schultz 233, R. Goldthwaith 233, C. Bayha 232, R. Kinsey 230, W. Grube 228, C. Doyle 220.

New York City Corps.

THE New York Corps, Captain, R. Busse, finished its summer practice shoot at Union Hill range last week. The list of winning members on the several targets are appended. Scores:

Bullseye target, best shot, 4in. center, degrees: J. Facklamm 24, J. Keller 32½, R. Busse 34, A. Wiltz 66, H. Radloff 78, A. Keller 80½, C. G. Zettler 85, O. Schwanermann 95, C. Wagner 100, R. Schwanermann 133, C. Schmidt 155, R. Bendler 167 degrees.

Ring target, 10 shot scores, most points for the season: R. Bendler 5,357, Ch. Wagner 4,219, R. Busse 4,083, A. Kronsberg 2,402, J. Facklamm 2,285, H. Radloff 1,656, R. Schwanermann 1,418.

Point target, most points: J. Facklamm 314, R. Busse 296, A. Kronsberg 263, R. Bendler 151, H. Radloff 90, R. Schwanermann 70, C. G. Zettler 61, Ch. Wagner 54, O. Schwanermann 52.

Plattddeutsch Schuetzen Corps.

THIS corps, which is one of the younger societies in our large group of shooting organizations in and about New York city, opened its winter gallery practice on the Zettler Bros. ranges on Monday, Oct. 19. Nine members were present, and took part in the contest. Scores:

Plattddeutsch Corps, 3-shot scores, 25-ring target, two best scores to count, .22cal., distance 75ft.: H. Helmke, 73, 71; H. Lohman, 72, 70; A. Bischoff, 70, 69; F. Passe, 70, 69; H. Rottger, 66, 66; Ch. Remecke, 62, 60; F. Schmidt, 63, 58; W. J. Hopper, 63, 61; H. Van Hinken, 58, 49.

Zettler Rifle Club.

THE winter gallery shooting of the Zettler Rifle Club for the coming season was opened at the club's headquarters, No. 159 West Twenty-third street, New York, on Oct. 20. While there was a large attendance, of the club members, few of them took part in the opening. Several of the members had just returned from their fall outings and summer vacations, and they were more interested in the event that brought them together again. President Gus Zimmermann was on hand to greet his fellow members and receive their congratulations for his success at the Bundesfest in Hanover and Hamburg, Germany. Louis Maurer, who has just returned from his annual hunting trip in northern Maine, too, had many pleasant experiences to relate. Vice-President Henry D. Mueller had a new supply to his fund of good and interesting stories. The meeting was, in fact, a home-gathering of congenial spirits, who were pleased to return to the old rendezvous again. The scores of the members who took part in the opening of the winter shoot are appended:

Ten-shot scores, 5 scores (consecutive) to count:
W A Tewes.....239 245 245 241 245—1215
E Van Zandt.....242 241 237 242 243—1205
W A Hicks.....240 241 240 239 239—1199
R Gute.....238 243 239 238 240—1198
Geo Ludwig.....237 237 240 237 245—1196
Louis Maurer.....233 236 237 237 259—1182
H D Mueller.....227 234 231 231 239—1162
Geo. J. Bernius.....222 225 228 231 225—1131

Independent New York Corps.

The annual festival and king shoot of the Independent Corps, Captain Herman Weber, was held in Union Hill Park, on Sept. 17. Owing to bad weather, the shoot was extended to Oct. 15, and in the meantime the extension was declared off and the prizes were distributed to men with the high scores. At the close of the shoot on Sept. 17, the prizes were given out by the shooting master, Gus Zimmermann, at the Zettler Club headquarters, on Oct. 20.

The list of the winners, their scores and prizes won are appended:

Independent New York Corps—Bullseye, best center shot: M. Dorrlor, 30 degrees, \$15; L. P. Hansen, 41, \$12; George Schlicht, 46½, \$10; Gus Zimmermann, 49½, \$8; R. Gute, 52, \$7; Wm. Hayes, 52, \$6; B. Zettler, 61, \$5; E. Greiner, 64½, \$5; G. D. Wiegman, 109, \$4; Hy. Kröger, Jr., 107½, \$3; M. Schultheis, 114, \$2; A. Begerow, 115½, \$2; Geo. Zimmermann, 126, \$1.

Ring target, 3 shots: L. P. Hansen, 71, \$20; Gus Zimmermann, 70, \$12.33; A. Kronsberg, 70, \$12.33; M. Dorrlor, 70, \$12.33; R. Gute, 69, \$7.50; W. Hayes, 69, \$7.50; L. Schmidt, 68, \$7; Geo. Schlicht, 67, \$6; A. Begerow, 66, \$6; B. Zettler, 64, \$5; W. Söll, 63, \$5; Hy. Kröger, Jr., 60, \$4; C. Von der Broek, 27, \$4.

First bullseye: Geo. Schlicht.

Last bullseye: Gus Zimmermann.

Presque Isle Rifle Club.

ERIE, Pa., Oct. 17.—The members of the club seem to be losing interest in their matches, as only four of them were present to-day, but it was a raw, cold day, with a high west wind blowing. Shooting offhand at 200yds. on Standard target, the following scores were made, Mount beating his previous record:

A Mount.....81 70 67—218 J Almeda.....66 63 61—189
J Sidham.....76 73 66—215 J Bacon.....65 62 60—187
CABIA BLANCO.

Trapshooting.

Fixtures.

Oct. 26-31.—French Lick Springs, Ind.—First grand tournament of the National Gun Club; \$500 added. John M. Lilly, Pres.

Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

The Chicago Gun Club has fixed upon Nov. 26 for a shoot, open to all amateurs.

In the badge shoot of the Audubon Gun Club, of Buffalo, Oct. 17, 25 targets, Messrs. Hughes, Stevens and Davis tied on 23.

At Paducah, Ky., tournament, which commenced on Oct. 20, Mr. Fred Gilbert was high professional, with 482 out of 500. J. M. Hughes was second with 473. Of the amateurs, Mr. C. O. Le Compte was high with 461.

In the Sheepshead Bay Gun Club handicap shoot, 100 targets for a gold watch, at Sheepshead Bay, Oct. 21, Mr. H. Hutchins was the winner. There were eleven contestants. Three shoot-offs were necessary to determine the winner.

This week closes the summer and fall trapshooting season of the Garfield Gun Club, of Chicago. However, Dr. J. W. Meek, the secretary, reports that additional weekly shoots will be held if a sufficient number of members desire them.

Messrs. A. A. Felix and Fred Miller shot a match at 50 live birds, 30 yards rise, reported to be for \$100 a side. It took place on Point Breeze race track, near Philadelphia, Oct. 24. The wind was stiff, the birds were good, and the scores were: Felix 42, Miller 39.

"Bonasa," in our trap columns this week, conveys the pleasing information from Cincinnati that Mr. Arthur Gambell's son Lutie has so far recovered from his recent injury that he is able to be up and about with the aid of a cane. May his total recovery be near.

The match between Messrs. H. M. Clark and J. L. Head, 50 live birds each, was won by Clark with a score of 47 to 44. Clark, by prearrangement, was forthwith challenged by Mr. Max Witzgreuter, same conditions, and he won by a score of 47 to 46. Mr. Witz now holds the trophy emblematic of the Indiana State championship at live birds.

In the shoot of the New York Athletic Club, at Travers Island, Oct. 24, Mr. F. W. Perkins, comparatively an inexperienced shooter, won the silver loving cup, the prize in the 100-target handicap event, and also the gold penknife in the 25-target event. Mr. Fred Vilmar has donated a silver loving cup as a prize of the club shoot, fixed to be held on Election Day.

We are informed that the Yale Gun Club has disbanded. There will be no Yale team in the Intercollegiate championship match Nov. 21, at Cambridge, this year. The Yale team was the most successful of any team in the Intercollegiate contests. The action to disband was consequent to the refusal of the University Athletic Committee to grant the wearing of "Y," thus leaving the team without any insignia.

Mr. Will K. Park, the popular and energetic trap editor of Sporting Life, announces that the committee on the "Howard Ridge testimonial" have turned over to Mrs. Ridge \$237, the net amount realized in the testimonial event held in connection with the Florists' shoot Sept. 29-Oct. 2. The amount includes all the moneys received, whether the tickets were used or not. He concludes by saying: "All who assisted in any way in this testimonial have the sincere thanks of the committee and the beneficiary."

The S. S. White Gun Club team defeated the Arlington Gun Club team, eleven men on a side, on the grounds of the Delaware County Country Club, on Oct. 24, by a score of 146 to 121. Each man shot at 25 targets. The scores were as follows: S. S. White team: Harper 22, Denham 14, Wilkins 14, Cantrell 13, Robinson 14, Dr. Cotting 16, Hinkson 12, Parry 11, Semper 11, Kendall 10, Read 9. Total 146. Arlington team: Harroitt 20, Fontain 16, Pratt 15, Dr. Lake 13, Lebon 13, Redman 10, Rossberg 8, Newton 8, Stout 7, Bowen 6, Snyder 5. Total 121.

Mr. J. S. Fanning, an eminent trapshooter of the Laffin & Rand Powder Co., has many interesting anecdotes of his eleven months' sojourn on the Western coast. One item of especial interest to trapshooters is the great tournament to be held in conjunction with the Lewis and Clark Centennial Exposition in 1905, at Portland, Ore. At least \$5,000 will be added, and no one will be barred from competition and no one will have a handicap. The exposition is to be held in commemoration of the exploration of Oregon by the Lewis and Clark expedition, which was the beginning of Oregon's development, as indeed it was the developmental beginning of the entire Northwest by the great fur companies of Canada and the United States.

Last week it so happened that two skillful sportsmen, famous trapshooters, were visitors in New York. One was Mr. W. T. Nash, president of the Indianapolis Gun Club; the other was Col. B. W. Sperry, secretary of the Jacksonville, Fla., Gun Club. Each one is a performer of eminent skill. What was more harmoniously in order than to arrange a friendly shoot; so on Thursday, with Mr. John S. Wright, in his happiest mood of mind and actively in charge of the shoot, the party assembled on the grounds of the Brooklyn Gun Club. Besides Messrs. Sperry and Nash, there were Messrs. C. A. Lockwood, of Jamaica, and Wm. Hopkins, of Aqueduct, two of New York's best, and Messrs. Batten and Waters, of Forest and Stream. The wind blew stiffly and variably, the targets were thrown swiftly and variably, yet the visitors proved their skill. Both were handicapped by using strange guns. Messrs. Nash and Hopkins, in an event at doubles, scored 8, which was excellent work under the hard conditions. Col. Sperry broke 22 out of 25 in one event, as did also Mr. Hopkins. Mr. Nash returned to Indianapolis in the evening. All departed with an earnest wish to try it all over again some day. Mr. John Wright's assiduous efforts contributed in no small degree to the success of the event.

BERNARD WATERS.

Felix—Miller.

PHILADELPHIA, Pa., Oct. 24.—In a match at 50 live birds between Messrs. Anthony A. Felix and Fred Miller to-day, on the Point Breeze race track, Felix won by a score of 42 to 39. A stiff wind helped the birds greatly, and made the shooting correspondingly more difficult. The birds were a good, strong lot. The conditions were 30yds., 50 birds:

A. A. Felix.....22121202222222021212221120—22
*120222222222222222222222—20—42
Fred Miller.....221*22121*12202122020201—19
101222221212*220122212*—20—39

A miss-and-out sweepstake at live birds, with eight entries, followed. At the fifth round Coleman, McAfee, Leonard, Felix and Miller had straight scores. Coleman missed his sixth and McAfee lost his ninth. Miller, Felix and Leonard each killed 9 birds and divided the purse.

WESTERN TRAP.

Rohrer's Island.

Following are the names of the winners in the recent prize shoot of the Rohrer's Island Gun Club, of Dayton, Ohio. First event, 1st prize, Dr. Hook; 2d, C. Smyth; 3d, W. Kuntz.

Second event, 1st, W. Kuntz; 2d, C. Smyth; 3d, Dr. Hook. The club medal was won by Charles Miller. Those who took part in the outing were Messrs. Dennick, Schaerf, Craig, Clark, Kersner, Theobald, Doneghor, Hash, Cook, Whittaker, Gerlaugh, Hohm, Nunlist, Ballman, Nohr, Selby, Gemin, Brandenberg, Hales, Ike, Rohrer, Cain, Tredway, Reigler, Stoddard and Mrs. May.

L. D. Arndt won the Peters gold medal at the fall shoot of the Tiffin (Ohio) Gun Club, on Oct. 23. There were ten contestants, the match being at 50 targets. Arndt's score was 49.

Fort Wayne, Ind.

A big crowd assembled on the grounds of the Corner Rod and Gun Club, Oct. 19, the occasion being the shoot for the State championship trophy between H. Clark, of Wabash, holder, and J. L. Head, of Peru, challenger. All conditions were favorable, well as the shooters enjoyed the day.

The weather was fine, the birds a good lot, and the spectators as Shooting began at 9:30 A. M., the first event on the programme being a match between Joe Smiley, of Matthews, Ind., and Will Ferrell, of Muncie. This was at 50 birds for \$50 a side, and was won by Smiley with 34 to 33. Of Ferrell's last birds, five fell dead out, more than enough to have won him the match if he had got just a little more shot into them. After this three handicap sweepstakes and a miss and out event were shot. First money was divided by Rodney Fleming and Jack Hines on straight scores in the 5-bird sweep. Williamson and Clark were the only ones to kill straight in the 7-bird event, and divided first. In the 10-bird event Keller, of the local shooters, and Clark tied on 10 straight, and divided first.

The boys played a trick on Sam Miner in one of the sweeps, by placing a spring chicken in the trap instead of a pigeon. It didn't rattle Sam a bit. He just killed the bird, and won the title of champion chicken shot. The retrieving was done by G. G. Williamson's (Muncie) dog Lady's Count Gladstone; a dog belonging to G. W. Wagner, of Peru, and Gale, belonging to Charles Rundell, of Fort Wayne. They did the work well, and it was a pleasure to watch them. Next the main event, the match between Clark and Head, was started. It resulted in a victory for Clark by a score of 47 to 44. Then came what was the big event in local estimation, as Max Witzgreuter immediately challenged Clark for the trophy. This was according to previous arrangement, and the match was started at once. Witz shot in fine form, and won by a score of 47 to 46. Once more the trophy is in Fort Wayne, and there it will remain until a better man than Witz comes along. The scores:

Event No. 1, match, Smiley vs. Ferrell, 50 birds, \$50 a side:
Smiley.....21*0222212002012110201111—18
010210120000222222222222—16—34

BONASA.

Garfield Gun Club.

CHICAGO, Oct. 24.—The appended scores were made on our grounds to-day on the occasion of the sixth trophy shoot of the fourth series. Fred Stone won Class A trophy on a score of 24 out of 25. Snyder won B on 22, and Birkland C, on 16. Aside from a rather chilling wind from the right quarter, the day was a fine one for trapshooting. The wind, while chilly, was not strong enough to materially affect the flight of targets.

One more shoot winds up the regular season. If attendance warrants it we may continue.

Trophy shoot:

Chicago Gun Club.

THE Chicago Gun Club will hold a special holiday shoot on Thanksgiving Day, Nov. 26, 1903. Grounds, 79th street and Vincennes Road. Take Wentworth avenue cars direct to the grounds.

Competition is open to all amateurs. Shooting commences promptly at 9 A. M. The contest will be for a beautiful solid silver trophy, known as the White Horse Cellar Coronation Snuff Mull, presented by P. J. Mackie, Esq., Isley, Scotland. It will be a prize to the high gun. This trophy is a curiosity, being an antique, and cost originally \$65. It can be seen at Von Lengerke & Antoine's gun store, 277-279 Wabash avenue, where it will remain on exhibition until the day of the contest. The contest will be open to members of the different gun clubs of Chicago, and all amateurs, and will be at 50 targets each man, distance handicap ranging from 16 to 20yds. Expert traps, Sergeant system. The trophy will become the sole property of the winner. Prizes also for the twelve high guns. The contest will be an optional sweepstake, \$3 entrance, for those who desire to shoot for the money. Shooters who do not care to shoot in the sweepstake can shoot for the prizes only. Shooting will be in rounds of 15, 15 and

20 targets; all ties to shoot off in rounds of 10 targets each. Entries close on the firing of the last shot in the first squad.

Prize of targets, 2 cents each, to be paid by each shooter before stepping to the score. Bring your shells with you, as there will be none for sale on the grounds.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Oct. 24.—The fourth competition for the October cup resulted in a tie between Messrs. W. W. Marshall and L. W. Palmer, Jr. There was a strong wind, which made the shooting extra difficult. The scores:

October Cup, 25 targets, handicap, allowances added: L. M. Palmer, Jr. (2) 25, W. W. Marshall (5) 25, G. R. Meeker (5) 24, A. G. Southworth (5) 24, H. M. Brigham (0) 23, T. W. Stake (5) 22, Dr. J. J. Keyes (3) 22.

Trophy shoot, 15 targets, handicap: T. W. Stake (3) 15, J. H. Jack (2) 12, W. W. Marshall (3) 12, H. M. Brigham (0) 11, A. G. Southworth (3) 9, G. R. Meeker (3) 6.

Trophy shoot, 15 targets, handicap: W. W. Marshall (3) 15, J. H. Jack (2) 13, H. M. Brigham (0) 13, T. W. Stake (3) 12, G. R. Meeker (2) 9, A. G. Southworth (3) 8.

Trophy shoot, 15 targets, handicap: L. M. Palmer, Jr. (1) 15, J. H. Jack (2) 13, W. W. Marshall (3) 13, A. G. Southworth (3) 12, H. M. Brigham (0) 11, G. R. Meeker (3) 8.

Trophy shoot, 25 targets, handicap: H. B. Vanderveer (5) 25, L. M. Palmer, Jr. (2) 25, J. H. Jack (4) 23, H. M. Brigham (0) 23, W. W. Marshall (5) 23, A. G. Southworth (5) 22, G. R. Meeker (5) 22.

Shoot-off: Vanderveer 25, Palmer 24.
Trophy shoot, 15 targets, handicap: H. B. Vanderveer (5) 25, L. M. Palmer, Jr. (2) 24, H. M. Brigham (0) 23, W. W. Marshall (5) 23, J. H. Jack (4) 22, Dr. J. J. Keyes (3) 22, G. R. Meeker (3) 21, A. G. Southworth (5) 21.

Trophy shoot, 15 targets, handicap: Dr. J. J. Keyes (2) 15, L. M. Palmer, Jr. (1) 15, H. B. Vanderveer (3) 15, H. M. Brigham (0) 14, G. R. Meeker (3) 12, T. W. Stake (3) 12, J. H. Jack (2) 10, A. G. Southworth (3) 8, W. W. Marshall (3) 7.

Shoot-off: Keyes 15, Palmer 13, Vanderveer 13.

Trophy shoot, 15 targets, handicap: G. R. Meeker (3) 15, Dr. J. J. Keyes (2) 15, A. G. Southworth (3) 15, H. M. Brigham (0) 14, W. W. Marshall (3) 14, H. B. Vanderveer (3) 13, L. M. Palmer, Jr. (1) 13, T. W. Stake (3) 10.

Shoot-off: Southworth 13, Keyes 12, Meeker 9.

Trophy shoot, 15 targets, handicap: H. M. Brigham (0) 14, L. M. Palmer, Jr. (1) 14, W. W. Marshall (3) 14, A. G. Southworth (3) 13, Dr. J. J. Keyes (3) 12, H. B. Vanderveer (3) 11, J. H. Jack (2) 9, G. R. Meeker (3) 9.

Shoot-off: Palmer 15, Brigham 13, Marshall 13.

Brooklyn Gun Club.

Brooklyn, L. I., Oct. 24.—There were eight shooters in attendance at the shoot of the Brooklyn Gun Club to-day. Wash was high man in the totals. The scores:

Events:	1	2	3	4	5	6	7	8
Targets:	10	15	15	25	25	10	*	*
Wash	9	14	15	21	20	10	8	8

R. Grinnell	8	10	..	7	..
Winter	15	15	..	6	..

On Wednesday, Oct. 28, at 1 P. M., the B. G. C. will hold a 100-target handicap, entrance price of targets; prizes donated.

*Five pairs.

Sheepshead Bay Rod and Gun Club.

Sheepshead Bay, L. I., Oct. 21.—The gold watch handicap, 100 targets, drew eleven entries, Messrs. Hutchings, Piercy and Lockwood tied on 100. Three shoot-offs were necessary to determine the winner, which proved to be Mr. Hutchins. Several practice events were shot. The scores of the gold watch allowance handicap, 100 targets, follow:

Targets:	25	25	25	Broke.	Hdp.	Total.
H Hutchings	19	16	22	19	78	24
G Piercy	23	22	25	24	94	7

IN NEW JERSEY.

Trap at Lake Denmark.

Lake Denmark, N. J., Oct. 24.—A pleasant live-bird shoot, two events, was shot at Lake Denmark to-day, one of the contestants being the redoubtable expert, Mr. Thomas W. Morfey. This is Mr. Morfey's second live-bird shoot since March 6 last. He is now devoting his energies to the Mount Pleasant Dairy, Stock and Poultry Farm, at Dover, N. J., in which he is making notable success.

All the contestants were of Dover, excepting two, Mr. James Timmons, of Morristown, and Mr. John Rickett, of Rockaway. Class, Jr., is a youth of sixteen or seventeen years. His scores of 9 out of 10 and 5 straight are excellent. Mr. Timmons was the only contestant who killed straight in both events. The scores:

	No. 1.	No. 2.
Rickett	2121210111—9	11120—4
Morfey	1112221122—10	20222—4
Timmons	222122222—10	22222—5
Taylor	1020111102—7	20222—4
Hinchman	2001102221—7	22222—4
Baker	222111222—10	22220—4
Fanning	0111001012—6	20111—4
Munson	022222222—9	02122—4
Schomp	0111202200—6	12000—2
Class, Jr.	112120222—9	22121—5

Baltimore Shooting Association.

BALTIMORE, Md.—The ninth annual tournament of the Baltimore Shooting Association was held on Oct. 14 and 15. In the merchandise event, the handicaps, by distance, were as follows:

Lupus 17, German 19, Chew 18, Foard 17, Malone 17, Cottman 16, Coulbourn 17, Bowen 17, Smith 17, Edwards 16, L. S. Mordecai 16, Hawkins 20, Storr 18, Fulford 20, Pennsy 17, McElvey 17, George 17, Mordecai 18, Philbrook 16, Scott 16, T. E. Cottman 16, Schaab 17.

The first day had a target programme, of which in the nine sweepstake events, Mr. J. Mowell Hawkins was high with 137 out of 150. Mr. E. D. Fulford was second with 134. In the amateur class Mr. Lester German was high with 134. In the first 20-target race, Mr. J. R. Malone made the only clean score of the 20-target events, although he had a severely injured hand, due to an accident while adjusting the traps before the shooting commenced. The scores:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	20	10	20	15	20	15	20	50
Lupus	7	13	16	11	15	12	16	12	16	40
Hawkins	9	15	16	13	19	14	19	15	17	43

Scott								6	14	29
Edwards										37
T. E. Cottman										36
L. S. Mordecai										24
Schaab										41

No. 10, the merchandise event was won by Lester German, of Aberdeen, Md., with 46. The prize was silver plate, 10 of them. Storr and Malone got 44 each, Chew, Fulford and Hawkins 43, McElvey 42, Lupus 40. Pennsy and George shot off for the tenth prize, and George won.

Oct. 15, Second Day.

The Maryland Handicap, 20 live birds, \$10 entrance, was the event of main interest to-day. To the winner a silver cup. The supply of birds was exhausted when Fulford had shot his 19th, thus leaving one bird short of finishing the event. Malone lost his 20th, a red bird, near the hour of twilight. Storr and Malone were tied on 19 at that juncture. Storr was not shooting for money. Hawkins shot from the 32yd. mark. Fulford subsequently missed his 20th, which thereby left Malone the winner. The scores:

Events:	1	2	3	4	5	6	7
Targets:	15	20	15	20	15	15	30
Hawkins	15	14	13	15	13	13	25

Fulford	221221221212212212110-19						

In the shoot-off for the cup the Maryland Handicap event, 5 birds, Oct. 19, Malone defeated Storr by a score of 5 to 4.

The high averages of the two days at targets were: Hawkins, first, with a total of 220 out of 250; Fulford, second, 219; German, third, 218; Storr, fourth, 213, and Foard, fifth, 210. To-day Lester German made high average. Foard was second. Storr, Chew and Fulford tied for third.

J. BREIDENBEND, Sec'y.

Paducah (Ky.) Gun Club.

THE fourth annual tournament of the Paducah Gun Club was held at La Belle Park, on Oct. 20, 21 and 22. The lateness of the season caused a smaller attendance than at past affairs of the kind, but it was nevertheless a most successful event, both professional and amateur classes being well represented, and some good scores made.

The out-of-town shooters arrived Monday evening, and Tuesday evening, after the labors of the day were over, they were entertained at a down-South 'possum bake and fish fry, and they certainly did full justice to the feast.

On Wednesday evening a theatre party was made up and spent a pleasant evening.

High average was won by Fred Gilbert with 482 out of 500; J. M. Hughes, of Palmyra, Wis., second with 473.

High amateur average was won by C. O. Le Compte, of Eminence, Ky., with 461. Messrs. Gilbert and Le Compte were presented with handsome silver loving cups, as trophies, and Moses Starr, of Paducah, won the home trophy.

The directors of the club passed the following resolutions in recognition of the services rendered by Mr. H. C. Bronough:

"We, the directors of the Paducah Gun Club, hereby tender our thanks and expression of appreciation to Mr. H. C. Bronough for his services in so ably assisting the management in conducting the fourth annual tournament, held at Paducah, Ky., Oct. 20-23."

Superintendent Hills, of the N. C. & St. L. R. R., puts as much enthusiasm into his trapshooting as he does into his duty of advancing the interests of his road, and he is an excellent shot. His efforts and energy have had much to do with the success which has always attended the club.

The barbecued dinner which was served free each day was a welcome change from a hotel menu.

The following shot at 500 targets and made totals as follows: Gilbert 482, Hughes 473, Spencer 469, Le Compte 461, H. Storr 450, Marshall 448, B. Starr 448, Phellis 445, Brady 444, Mercer 444, Davis 442, Meadows 441, Rouse 439, Waters 436, Prouse 434, Armstrong 426, Hills 402.

Shooting at 250 targets, Moore broke 211, Moss 210.

The third day was devoted to live-bird shooting, and a large crowd of spectators was in attendance to witness the close of a very successful tournament.

The cup for best average by a club member was held last year by H. Bronough.

The Paducah boys offered to match their Starr team (Moses and Ben) against the world for a big purse, but had no takers. The scores follow:

Event No. 1, 5 birds, \$4.25 entrance, 40, 30, 20, 10 per cent.:	1	2	3	4	5	6	7
Phil, 31yds., 5; Armstrong, 27yds., 4; Page, 29yds., 3; Brady, 28yds., 4; Le Compte, 28yds., 5; B. Starr, 29yds., 5; M. Starr, 29yds., 5; Spencer, 31yds., 5; McKinnen, 27yds., 4; Marshall, 32yds., 4; Robinson, 27yds., 5; Eaker, 26yds., 5; Waters, 31yds., 5; Moxall, 28yds., 5; Mercer, 26yds., 2; Reuse, 27yds., 4; Davis, 27yds., 4; Steger, 27yds., 4; Gilbert, 33yds., 5; Hughes, 31yds., 5; Welles, 26yds., 3; Preuse, 27yds., 5.							

Event No. 2, 25 birds, \$26.25 entrance; \$500 guaranteed:	1	2	3	4	5	6	7

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1908 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, NOVEMBER 7, 1908.

VOL. LXI.—No. 19.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

OUR CHRISTMAS NUMBER.

THE Christmas Number of the FOREST AND STREAM will be the regular issue of December 5. It will be enlarged and handsomely illustrated, and the cover will be printed in colors. The price will be 25 cents. Order from your newsdealer in advance.

The pictorial features of the Christmas FOREST AND STREAM will be of exceptional interest and value. The number will be among the handsomest publications of the season.

DOWN THE MISSISSIPPI.

WE shall begin in our issue of November 21 Raymond S. Spears' story of the expedition "Down the Mississippi" which he has undertaken at the instance of FOREST AND STREAM and for the benefit of its readers. Those who followed Mr. Spears in his "Walk Down South" require no assurance that in the new serial they have a rich treat in store. The chapters will be among the many good things to appear in the forthcoming issues of this journal.

NEW YORK EXPORT AND LICENSE.

THE New York prohibition of export of game is sufficiently definite and explicit for the understanding of all concerned. It reads:

"Sec. 38. Birds or game, except fish, taken in this State shall not be transported without the State; nor shall the same be taken or possessed with intent to transport the same without the State."

The only question of interpretation of the law is with reference to game killed in certain counties bordering New Jersey, from which the gunner returning to his home in New York State passes through New Jersey. To take game into New Jersey is to transport "without the State," but when the actual destination of the owner accompanying the game is in New York State, the authorities take a common sense view of the matter, and do not construe such carrying as export.

The New Jersey authorities, however, interfere with the transportation. The law of New Jersey prohibits the export of game from that State. The wardens assume jurisdiction over game brought from New York into New Jersey on its way to New York, and when the sportsman with his birds reaches Jersey City and attempts to cross the ferry to New York the New Jersey wardens say the game is contraband because in course of exportation from New Jersey.

This interference by the New Jersey authorities may be obviated if the game in a package is given to the express company for delivery in New York city, and if the owner accompanies it on the same train. The New Jersey law exempts "common carriers [i. e., railroads, express companies, steamboats, stages, and other transportation lines] carrying from beyond the confines of this State in unbroken packages to some point beyond the confines of this State."

The New York law respecting non-resident shooting licenses is so clumsily worded that even the authorities are befogged as to the meaning of certain of its provisions. This is the text of the section:

Sec. 89. Non-residents.—On fresh water forming a part of the State boundaries, or through which the State boundary runs, no non-resident of the State shall take any kind of fish or game in that part thereof within this State unless residents of this State may lawfully take the same kind of fish or game in such part of said waters as are not within the State, during the open season therefor in the State or country in which such waters are situated.

If any license fee to take such fish or game in waters not in this State, be required of a resident of this State a non-resident may take the same kind of fish or game in such waters within this State, if a license so to do shall have been first obtained from the Commissioner. Nor shall any non-resident not the owner of real estate in this State and against whose real estate there are no delinquent taxes, take fish by spearing in this State except on a like license if there is any discrimination by requiring a license or otherwise in the State or country where such non-resident resides against residents of New York in taking fish in such State or country. Game shall not be taken by any such non-resident except pursuant to a license issued on payment of a fee not less in amount than the fee, if any, required of a resident of New York for taking game in the State or country where such non-resident resides, and if there be none, then on payment of such fee as the Commission shall prescribe.

The first part of the section is clear. It means that a resident of a State which has a non-resident license for shooting must pay an equivalent license for the privilege of shooting on the boundary fresh waters within this State. As to territory not comprised in the description "fresh water forming a part of the State boundaries," it appears to have been the intent of the Legislature to exact from the non-resident shooter a license fee equivalent to the fee charged non-residents in his own State. If this was the intention, the entire territory of New York, whether fresh water boundaries or inland, would be treated in the same way, and the simple provision would have been that a non-resident before shooting in New York must pay a license fee equal to the non-resident shooting license fee exacted in his own State. The entire section is retaliatory and is not based on sound principles of legislation. If New York deems it necessary to license non-resident shooters, the license should be made uniform for all alike; retaliation is unworthy and has no place in a code of game and fish laws. As a matter of fact the game authorities do not exact a license from non-residents for shooting except upon boundary fresh water.

TIPPING.

It is commonly supposed that the tip is a gratuity given by an appreciative or grateful donor to some one who has rendered an extra and acceptable personal service, but who has already been paid for that service in a regular way. There are several grades of the unearned gratuity. There is the honorarium so pleasingly recognized among professional men; there is the *douceur* which sometimes is so near the border between a gratuity and a bribe; there is the *lagniappe* of Louisiana, which, in a way, corresponds to the cosmopolitan gratuity called a tip.

As between tipper and tippee, extra personal attention, skill and care in attending to all matters of detail which refer to the safeguarding of one's belongings, or administering especially to one's comfort, are assumed to be the basic justification for the bestowal of the tip at all. However, in matters of justification, the tippee refrains from investigating too curiously.

In America, it is generally though erroneously accepted as an established fact, that in Europe, the system of tipping is nicely adjusted on a reasonably moderate, amicable, conventional basis, satisfactory alike to him who gives and to him who receives. In both Europe and America, however, particularly in the large cities, the tip, as a gratuity, has almost ceased to exist. By servants, whether hotel or restaurant waiters, baggage-men at the great depots, Pullman porters, and others, it is looked for and aggressively played for as a fee to be paid, with an entire disregard as to whether or not any extra personal service has been rendered for it. Indeed, it is not infrequently expected to be given for refraining to do injury instead of for extra effort to do good.

The aggressive devices for extracting the tip are many. Each guild has its specialty. The Pullman car porter is, at the last moment, spectacularly attentive with his whisk broom, brushing strenuously at imaginary dust, obsequious to an abject degree till he secures the coveted tip, whereupon he relapses into the most apathetic indifference.

The baggageman, if bribed, will refrain, perhaps, from smashing baggage for the bribe's sake, or if he delivers it in the house, he may refrain from smashing the banisters, scraping the paper off the wall, or wrecking the chandeliers, if perchance he will consent

to carry it further than the front door before being placated with a tip, really a bribe.

The average restaurant waiter, as a tip collector, is the expert of all. He may, as a waiter, have no skill whatever, but as a tippee he is equal to a multitude. He is versatile in his methods. Generally, he is oppressively attentive, giving exaggerated importance to his carefulness and politeness, and in conclusion is aggressively conspicuous at the time of departure. Or he may figuratively try the virtue of the sandbag by being dilatory, deaf and surly. Let a man become a patron of any average restaurant in New York, and, if he does not tip, he will be served so badly that, in self-respect, he will have to abandon the place as a resort for dining. The merit of the case is not considered by the candidate for the tip, as being any factor to be taken into account. The guest is expected to tip whether served poorly or well.

Having no determinate origin, the tip, by the tippee, is supposed to be forthcoming as an official perquisite due by virtue of mere tipping usage, be the service what it may.

The sportsman who ventures forth with dog and gun is peculiarly the prey of the rapacious tippee. The possible injury to dog or gun, or the care needed by either, is the tippee's valuable asset in extracting the tip.

In England, the abuse of the tipping system seems to have reached a higher developmental stage than it has in America. The County Gentleman, in a recent issue, recounts that a sportsman, resident of a city in England, was invited for a week's shooting on a moor in Scotland. He found that he could shoot but one day, at the close of which he gave the head keeper a sovereign. With him he left his gun, requesting that it be sent on to another moor where he was due to shoot a few days later, and thereby save him the trouble of lugging it about. On his arrival at the place designated he failed to find his gun. Writing to the head keeper he received the following reply: "Sir: It is quite true your gun has not arrived, for it is in my possession, where it will remain until I receive the balance of what you owe me. You may not be aware that it is the rule on — Moor to always give paper (£5), and as you gave me one pound, I will be glad if you will send me four pounds, when your gun shall be sent."

The tipper sent this letter to the servant's master, who replied as follows: "Dear —: I am sorry my keeper has written to you in the way he has, but please clearly understand that I cannot interfere with his arrangements in the middle of the season." The tipper thereupon forwarded the four pounds, received his gun, and the tippee is still in the same employ.

This was rather a peculiar situation, concerning host, guest and servant, which, in America, bad as the tipping custom has become, would not be tolerated for a moment at any time of the season.

The aforementioned journal remarks on tipping: "As to the rich man who gives lavishly, the real harm he does is that he makes it very hard indeed for others who cannot afford large amounts, but yet who give what the rich man gives. And what a large total it comes to! A visit to a country house is not only a question of cabs, railway tickets and porters; there are also the coachman who fetches you from the station to the Hall and back again; the butler, the footman who valets, the chambermaid, besides the keepers, loaders and cartridge carriers. It is not surprising therefore, that so many men have absolutely to refuse invitations on account of their inability to tip as others do."

Thus the tip in some of its phases seems to have evolved from the world of gratuity into the world of graft.

All of which seems to indicate that the sandbag of the tippee is even more active in Europe than it is in America, though the signs of the times are that eventually we shall surpass that country in the magnitude of the custom which demands that something shall be paid for nothing in return. Of course, there is much of genuine personal attention over and above routine duty, betimes bestowed, which the beneficiary may justly recognize and reward, but there is a deal of sham in the world of tipping which should be ignored and left profitless.

The Sportsman Tourist.

The Voices from the Spring.

"THE sun is my father, my mother the earth.
As mist of the dark blue sea,
From the angel cloud,
Amid thundering loud,
I fall, a spring to be.
And here in my ever new, sylvan birth,
Dancing and glancing, perennial mirth,
The greenwood attesting my love and my worth,
My waters flow in glee.

"Gossamer fronds of midsummer ferns
Wave greenly upon my hills.
'Neath their plummy spires
My underground lyres,
In faintly tinkling rills,
Keep time as the firefly's night lamp burns,
Or sunshine golden to earth returns
To illumine my brook as it babbles and turns,
And music the forest thrills.

"With flower-lined banks and a basin of pearl,
Where shells lie pure and white
Under bluest of skies,
Whose counterpart lies
Within me in tenderest light.
My welling currents flash and curl,
As dimpling out in plash and purl
They fall in the brook with dash and swirl,
So laughing, prismatic, and bright.

"The bee and the hummingbird visiting here
Are mirrored as they drink.
And the trees that lean,
Dark, loving and green,
Far over my mossy brink,
And the moon and the stars of the midnight clear,
All twinkling and merry, reflected here,
A fairy-world seem, entrancingly near,
Where into my depths they sink.

"My life is wild and stainless and free,
And around me cluster and cling
A hundred sweet beauties,
All blessing the duties
That faith and courage bring.
For I love the world and the world loves me;
And my glad waters sing on their way to the sea.
Oh! how jolly a life it is to be
A frolicsome forest spring!"

Camping in the Wilds of St. Francis

The Story of Four Men and a Dog Amid the Swamps of Arkansas.

It was Nov. 1; without the wind was blowing a gale and occasionally the window blind would slam and the rain and snow would pitpat against the window pane. I had been trying for an hour to get interested in a work on fishculture, but had dozed off several times in the attempt.

Suddenly the 'phone whirled violently, nearly causing me to fall over backwards. It rang again before I regained my equilibrium as well as composure. "Hello! Hello! Bob, is that you? This is Wheeler." "Yes," I answered; "What is it, Captain?" "Sa-a-a-y, Bob, don't you want to go on a camp hunt down in Nigger-wool swamp?" I turned and looked out of the window and shivered. "When?" I faltered. "Why, now—right away, Dummy," he shouted. "This is just the time; got a wire from Bill Henson that the ducks and geese are coming in so thick that the chickens are going to roost two hours earlier every evening on account of the clouds made by the flights." I felt the blood in my veins take on a fresh start as I thought of the rare sport. "Well, well, wake up, what d'ye say, will you go or not?" "Sure I'll go," I answered. "When will we start?" "To-morrow morning, 8:40 o'clock." "All right, Cap, I'll see you to-night. I'll be ready."

I hurriedly rang for Smith, my secretary. "Smith, I'm going away for a few days—will start to-morrow A. M. Get all my mail up right away." "How about your appointment with the Manufacturers' Association to-morrow, Mr. S—?" Smith offered. This certainly was a stumper. My first impulse was to 'phone Wheeler that it was all off. I, being chairman of the association, of all others was supposed to be on hand. Then there was the question of railway discrimination to come up. Why did I not think of all this before I answered Wheeler? Well, I just could not disappoint him, he would sure have my scalp. Enter Smith again; "Here's a message from Mr. Blackmer stating that he will not be able to attend the meeting to-morrow owing to important business engagement." "Smith," I replied, "You send a letter to each member of the committee that our meeting is postponed until two weeks from to-day." I vowed the next time I saw Blackmer I would pay everything.

It was now nearly 3 o'clock and not a thing done toward my equipment. I had to 'phone my gunsmith to get my outfit to me at once. There were rubber boots, blankets, hunting coats, fishing tackle and everything contingent to a camp-hunt in Arkansas to be looked after. I went home early and sprang it on my wife. "Horrors! You are certainly crazy to go hunting this kind of weather. I did think when I married you that you would gradually get over the desire for such terrible journeys." I finally overcame her objections, as I always do, and got busy packing up my outfit. I saw Wheeler, and he said he had everything arranged—the tents, rations and all things necessary to a camp-hunt. He had anticipated my desires to a great extent, and engaged one of the best old souls that ever "Old Ireland sprung," in the person of Jeremiah Tracy "Av ye plaze," to do our cooking and look after the commissary equipment. Jerry was a mighty good

shot, too. Quite a number of young bloods, who want to do things quite in line with their braggadocio swagger, engaged Jerry about twice a year to accompany them on their "shooting trips." Of course, Jerry's accomplishments serves to make the "bag" quite respectable, but our reason for engaging Jerry was for his sterling worth and because we could trust him implicitly; and Jerry's camp stew was something that to be without would relieve our camp-hunt of one-half its pleasure.

The next morning found us started on our way and comfortably settled in the smoker for a day's journey. We arrived at Paragould, Ark., without mishap, and after supper took the "jerk-water" over to Buffalo Island. There we engaged three large bateaux from the club house, and having loaded our camp outfit and plunder, provided ourselves with a competent guide—for to attempt to navigate the St. Francis River without a guide would be as bad as an attempt to do Mammoth Cave without one. Only the practiced eye of the native guide can discern the channel, and even they sometimes get fooled. After one is confronted with a dozen channels to choose from you might travel up one of them for several hours before being confronted with an impassable barrier of brush wood and moss. Then there is the tiresome journey back, and the chances are, being without a guide, you would again get into the wrong channel, and it might finally result, after a half-dozen attempts to extricate yourself, that you gave up (and out, too), resigning yourself to your fate, i. e., to wait patiently for help, which might not come until next day. Then, again, the river is full of a most beautiful, but treacherous green moss. The water is simply beautiful—clear as crystal and always delightfully cool. We drank this water and found it very palatable. Let me say right here that this water is as near chemically pure as any river water in the world. The moss grows up from the bottom and moves with every motion of the current, resulting in a most beautiful effect. It seemed to me as if thousands of green flags were embedded in the river, moving to and fro, as the current pushed through them, causing the folds to ripple out in long waves. It's a sight worth going a thousand miles to see. Owing to the prevalence of this moss, rowing is simply out of the question. "Poling" is resorted to as a mode of navigation.

The guide provides himself with a long paddle at least twelve feet long, and standing erect in the boat, poles when he can touch the bottom and paddles when he cannot. One remarkable thing about the paddling is that the native never paddles on both sides. I have seen them paddle by the hour, and always on one side only. I've tried by the hour to learn the trick, but gave it up in disgust. "Ye jos-hol' your pole (paddle) this-away and throw it that-away, an' you go right along, ye see? Lemme show you," says the native, and away he goes again, but I turn away in despair and pass it up. Life is entirely too short, and as Jerry puts it, "The devil's in it, annyhow."

Well, we finally got away, the guide and Wheeler taking the front boat, and Baltezor, myself and Jerry manning the other two. Such a picnic, such strenuous sport I never before engaged in. Only one accident marred the journey. It was our pup Mephisto. Through some accident he got into my coat, and his master, Baltezor, being in another boat, caused his pupship much uneasiness. Our boats were about a half-mile apart, when Mephisto suddenly jumped overboard and made for his master. 'Twas rather a heroic effort on the part of the pup, and had it not been for prompt action on my part, he would now be frolicking in the Doggie's happy hunting grounds. He was a much wetter, but wiser dog, after being pulled out, and was satisfied to be wrapped in a blanket for the balance of the journey.

After four hours of hard work poling, pushing, paddling, we landed at Cypress Point. Here we dismissed our guide, as we found his too frequent potations of Jerry's bottle had had a very exhilarating effect upon him, and we decided to fire him, which we did much against his approval. "How'm I goin' t' git back?" he growled. "Swim," was Wheeler's rejoinder. "The h— you say!" he shouted, and started to draw his gun, but before he could draw Wheeler gave him a swift uppercut on the chin, which put our friend "out." He came to in about five minutes after Jerry had emptied two bucketfuls of water on him. We had relieved him of his gun during the interim. He raised himself to a sitting posture, rubbed his head and then rose to his feet. Wheeler pointed to the woods and said, "you git." He growled something under his breath, but concluded he had had enough of our society and vamosed, nor did we see anything more of him; maybe he found himself later lining the stomach of a catamount or some other varmint of the swamps, but we gave ourselves no uneasiness on his account. We got our "hotel" up in short order, and inside of a half hour we were making Jerry's hot cakes and maple syrup fly. This, washed down with black coffee, made us all over again "ready for any fray." After supper we resolved to reconnoitre, it still lacking an hour from sundown. We found nothing worthy of our powder, however, and started on our return. When nearing our camp, Jerry suddenly held up his hand and dropping to his knees, began peering through the thick undergrowth, which surrounded our camp. "Whist!" he whispered. "Pigs!" He rose to his feet and rushed forward with a shout, and we in his wake. We found the tent full of pigs—wild razor-backs—they were into everything—Jerry was crazy. "Ye devils!" he yelled. They paid no attention to him. We came to the rescue, and after belaboring right and left with the stocks of our guns, succeeded finally in driving them off.

Ordinarily, these razor-backs are as wild as deer, but when starving, as these evidently were, they will sometimes attack a man. We turned in early, posting Mephisto as guard for the night. We slept as only tired men can sleep, and only awoke when Jerry was shaking us, saying: "Are yez all dead?"

Coffee, hot biscuits, bacon and gravy à la Tracy constituted our breakfast. We pulled stakes by 6 o'clock and pushed onward up stream, as certainly a more dis-

mal place than Cypress Point is not on the map, glad enough we were to get away from it. After three hours' work we discovered the donique, on which old Bill Henson had squatted. Doniques are the oases—or dry spots that are found occasionally in the Nigger-wool swamp.

No one seems to know whence this name "Donique" came. There is a word "donock" signifying a stone, found in the encyclopedia—donique may be a corruption of it.

We found old Bill as grizzly as ever and gladly he welcomed us to his dominion, for these squatters are veritable kings and recognize no law except of their own making.

This was Henson's donique. Old Bill and his wife and daughter Rose welcomed us heartily, telling us to "make ye' sels' at home." We accordingly unlimbered our outfit, and in course of an hour were "at home." Leaving Jerry in charge, we started off again to reconnoitre, and incidentally to bag anything in the shape of game, coming our way. We succeeded in pulling down several mallards, and it turning colder, rapidly we put back for Camp Wheeler. Jerry had supper waiting for us, and we did eat ourselves to a condition of wellnigh imbecility. "Bedad!" says Jerry, "Ye'll ate yersels home in a wake at this rate," for like the old saw we "licked the platter clean." Our beds were made up on the ground; we took the precaution, however, to first lay about 200 clapboards (which we "borrowed" from Bill), on top of which we spread two bales of hay, which we laid in stock through the thoughtfulness of Captain Wheeler. To lie on the ground without these precautions would be almost suicide. The soil on these doniques is of various depths, six, eight and ten feet, and to my mind is liable to slip its cables at any time, and I so expressed my fears. But old Bill said, "I've been living heyar twenty years and I hain't seen no slide yit," and he guffawed so vehemently that the subject of our conversation shook very perceptibly. Wells are dug in this soil by simply driving a gas pipe down until it strikes water. A pointed perforated tip is screwed on to the driving end of the pipe. Sinking a well, in consequence, is not a laborious operation on a donique.

After supper we sat around smoking our corn cobs and listening to the rain pattering on our tent. Suddenly we heard Old Bill's voice saying, "Say, boyees, kin I c-min out-n the wet?" "Sure, Bill! Come in and join the festive throng," said Captain Wheeler. "Thought I'd come over and set with ye and p'raps you might want to hear my pianner." With that he pulled from under his coat an old fiddle. This was his "pianner." "Hyar she is, boyees. She's been busted more times'n I have, but she'll sound good s'long's there's a piece left on it." Sure enough, it was a veteran, scarred and seared from many an experience in company with its master, for Old Bill has been a hard case in his time. The numerous scars on his body attested to this fact. He had lost one eye in an encounter. He pulled open his shirt one day and showed me a hole in his breast that I could have put my fist into. "A load of No. 8 went in that," he muttered. "Doctor had a hard time diggin' me out. I spec' I wa'n't born to be shot to death or cut up, may be they'll hang me some day."

After he had regaled us with "Kitty Clyde," "Dixie," "Ole Gray Hoss" and several more tunes which I cannot now remember, he stopped suddenly with, "Ain't you'll got something good?" Captain Wheeler tipped Jerry a wink, and the bottle came forth, and Old Bill "tasted" it, and felt better. As a matter of fact, we had to almost throw him out. The bottle was certainly an attraction for him.

Next morning we were astir by daylight, and each one of us took a boat and started out for a day's pleasure, leaving Jerry and the dog to keep camp. We each took a lunch and a can of minnows and guns and ammunition. I struck out toward the west and up stream, the others preferring down stream. I was admonished not to go too far, for fear of accidents. I got into a nice body of water and pulled along complacently for an hour or so without incident. The wild, weird waste of water and country was attractive to me. Occasionally a heron would rise up out of the water and wing silently away. The barking of squirrels was heard incessantly. Strange waterfowl uttered discordant cries and sometimes a "woof-woof" from some donique would indicate a family of "razor-backs." I fell into a reverie—here was I but fifteen or twenty miles from civilization, yet here was a waste of country that evidently was still in its primitive state. I was indeed alone with nature—I was hypnotized by nature itself.

I tried to throw off the spell and vowed I would not let another gang of ducks pass me. But, here they come again, flying, and straight toward me, like a black cloud; as they near me up they rise and pass on beyond with a qua-a-a-ck, qua-a-a-ck, and yet I don't shoot. Why? I cannot tell, it remains simply, I cannot. A pretty story I will have for the boys when I get back. Well, they may go hang, I shan't tell them.

Soon I struck a narrow and swift channel, just the place for bass. I anchored to a tree and prepared for business. I got out my spoon and cast out in the middle of a troll. I could see the spoon whirling like a one-horse motor. Suddenly a black shadow from out the depths moved out and remained stationary for a minute. My heart nearly froze. I was in a tremble lest I should bat my eye. For I knew he was watching me. Then, like a flash he was after the spoon, and before I recovered the shock the line was nearly spent. I pressed down the brake and immediately my rod nearly bent double, then straight up in the air he rose and down again with a great crash he came toward me; rapidly I spun up my reel, till suddenly he was again off. I let him have the line gingerly and gradually worked him up closer and closer, and as he attempted a final coup, I slipped a long-handled landing net under him, and the prize was mine. A beautiful 4-pound striped bass. Ah! such sport, my blood was now up; I caught six after the same tactics and lost one; I was more than repaid already for the hardships experienced. Then, again, I had something to show the boys

as evidence that I had not been dreaming.

After awhile, there being a cessation of hostilities, no more strikes materializing, I allowed my gaze to drift to the bottom of the stream, about twenty feet down. I observed a large black object moving slowly up stream. At first glance I thought it an alligator. While alligators rarely get that far north, yet they have been seen there. After gazing more closely I concluded it to be a large school of catfish moving up stream slowly and as compactly as possible. They were lined up in twenties. They were evidently moving with a great deal of caution. After watching them for some time I purposely dropped my paddle, and away they scattered. There must have been several hundred of them. With all the seining going on there seems to be a few catfish left, anyway. Speaking of seining, reminds me that there is hardly a cut-off anywhere in the St. Francis but has a seine stretched across its mouth. Fishermen from Buffalo Island and Bertig make periodical visits to these seines and bring the fish in by the skiff load. They are then packed into barrels and shipped to St. Louis, Chicago and even to New York. Notwithstanding, it is contrary to law, but little effort is apparently being made to suppress this traffic.

One of the several clubs established down there did engage a man and had him sworn in as a United States deputy marshal, to look after this illicit business. He confiscated a great many seines and destroyed many more. After he had been shot at from ambush several times he gave it up as a "warm" job. I heard several of the natives say that they didn't want to "git" (kill) him. Just wanted to "skeer" him. Well, they skeered him all right. I also heard threats that if a certain club didn't quit interfering with their business they might wake up some morning and find no club house. (Shortly after this experience a large club house at Bertig was burned and has never been rebuilt. The members became discouraged, sought for and found another location.)

I arrived at camp without incident, and found the rest of the sportsmen had preceded me. They had bagged a dozen of fat mallards and three sprigtails.

It was agreed that in the morning we would go after deer, Old Bill having seen tracks and signs of them. So we started east the next morning to the "Ridge." We found where the deer had stripped the bark from a tree, which was the beginning of the trail. After following the trail for some little time, Bill concluded that the deer had bivouacked on the other side of the Ridge. So it was agreed that Bill and Jerry should go to the south and over the Ridge and beat up the brush and drive the deer over westward. We three spread about sixty yards apart and waited. I took the north side and threw myself down in the tall grass, commanding a good view of the ridge. I waited for three-quarters of an hour and had grown rather restless. I had visions of Bill and Jerry off under a tree having a good laugh at our expense. I was soon after on the point of giving up in disgust, when I heard a rustle back of me. I turned quickly and there, scarcely thirty yards from me, were two deer, one a fine buck. They stared at me and I at them, and we all stared. I never saw such large luminous eyes before. I raised my hand finally and ejaculated "Shoo!" and they "shooed." It didn't occur to me to shoot. It was my first sight of a wild deer. I did not have "buck ague," but it was a close relative. They started like the wind toward my companions, and I held my breath. Presently I heard bang—bang, then two barrels more. My friends did, indeed, bag two of them, and I—didn't. I thought it best not to relate my experience, having too much consideration for my peace of mind and reputation, as you may suppose. But we had venison for supper all right, and it was good.

Next morning old Bill came rushing into camp, shouting, "Git yer guns, boys, that's bar over yonder," pointing excitedly toward the west. We hurried to our boats and followed Bill, he leading in a dug-out. In about ten minutes we reached another donique and landed, Bill still leading. "You stay right hyar, boys, and I'll recon- niter," says Bill, and we stayed. We waited and waited—ten minutes, fifteen minutes, a half hour. "The old rascal's giving us a 'con' game," Cap Wheeler growled. "Let's go back," he added.

I was not in favor of taking snap judgment, and demurred against returning without Bill. So we waited. Suddenly we were startled by the report of a gun and Bill's voice shouting what we could not make out. We started on a double quick in his direction. We had gone but a dozen paces when Bill burst into the clearing, hat off, hair flying, eyes bulging, and screaming, "The bar, the bar! He's arter me now," and he tore past us like a whirlwind, and the bear followed right on his heels in a lope. If it were not that Bill's life was in danger, it would certainly have had a ludicrous aspect. Bill made straight for his dug-out, and the bear, paying no attention to us, made for Bill, and just as the latter made a leap of it his bearship fetched him a hook in the rear that carried away the seat of his trousers. But Bill was off and pushed off into midstream. Then bruin turned and saw us for the first time. He sat down on his hunkers, laid back his ears, showed his fangs, and growled. We cocked our guns and advanced on him slowly. I confess I felt rather shaky. "Now, boys," said Cap Wheeler, "steady it is, and altogether, and right at his eyes. Ready, fire!" When the smoke cleared away our bear lay curled up and asleep—put to sleep by three valiant hunters. It was a specimen of the small black bear found occasionally in the swamps, and when hungry are very fierce, and will often attack a man. Bill by this time had come ashore, and was busy bathing that part of his anatomy which suffered from the bear's left hook, but had not yet recovered his voice or composure. Presently he commenced to swear. Finally he looked up and said, "Well, boys, I was skeered and don't you forgit it. I thought the tarnal critter hed me for keens."

Here's his story: "I hit the trail jes' beyond the edge of the woods and found whar he'd been diggin' up the acorns and roots and I followed along. Pretty soon I cam' to some droppings that was still a-smoking and I gin to feel warm. Presently I heard a sound in the bresh close to my left, and bless my soul, the bar popped into me with a bump. I don't know which was skeered the most, me or the bar. He backed away from me with a wa-ugh! I brought my gun up and blazed away. I

was so frustrated that I fired wild. But it made him mad, and he rushed at me and knocked my gun out of my hands, and—well, boys, then I hollered and run, and you all know the rest. But I want my gun, and I want to git home quick and git the old woman to rub some 'intment on my rear." We loaded the bear into the boat and carried him to camp, and under Bill's direction skinned him and hung up the carcass.

Inasmuch as we three fired simultaneously at the varmint we were obliged to draw lots for the skin, which fell to Cap. Wheeler. It now adorns his library floor in the capacity of a rug. Old Bill said the skin by right ought to belong to him, for, he argued, did he not bring the game to us to shoot?

Jerry, the cook, tried to fry some bear steaks for breakfast the next morning, but we could eat none of it. It was altogether too gamy. Old Bill came to the rescue, and suggested that we broil them over the embers of our fire, which we did, and found the meat very palatable. That night, after we had turned in, it began to grow colder and the geese commenced coming in out of the storm—and such a noise as they did make. It was simply impossible to carry on a conversation. It took them an hour to get settled and become quiet.

It was proposed that we turn out at 4 A. M. and try to bag a few of them. We accordingly set the alarm clock. At 4 o'clock we three set out in our dug-outs toward the line of woods in the west, at which point we "spotted" them the night before. It was dark before us as a stack of black cats, and cold as charity. We could not smoke nor converse, nor hardly breathe for fear of flushing the gang. After we had struggled against the flags and moss for an hour, Cap. Wheeler signalled a halt by a low whistle. Very soon the first streaks of dawn became visible and with them came a sound of "honk-honk-honk," which we knew to be the signal of the old gander to make ready. We forthwith made ready, and waited for the flight to commence. Our previous discomfiture was entirely forgotten in the excitement pending. Suddenly there was a great rush and up the cloud of geese rose with their accompanying discordant cries and our guns spoke. My repeater spoke four times and three geese answered with their lives. Cap. Wheeler got four and Mr. Baltezer pulled down four more. We heard someone else firing in close proximity, and it developed in the person of Jerry, who had started breakfast and then started after us. "Bedad!" says he, "Oi never did see the like of 'em." He had three to his credit. "No more'n I got a bade on wan of 'em and another wan would get in the way, and I couldn't help killing two with one shot." It was certainly rare sport. Then we paddled back to camp. A cup of black coffee, some hot cakes, finished off with a pipe all around, soon set things to rights.

That morning Rose, Old Bill's daughter, gave us a fine exhibition of skill with a gun. The trees on the donique were very high, some as much as one hundred and fifty feet. There was a clearing of about one hundred feet where their cabin was located, and Rose, only about seventeen years old, would stand in this clearing and watch the tree tops and woe betide the duck or goose that attempted to fly over this clearing. While I was watching her, she caught a 12-pound goose as it started across, and it came to the ground with such force that it burst open. Old Bill says, "Yes, that's an old trick of the gal's," and didn't seem to think it much of a trick either. Another accomplishment Rose had was playing the harmonicon—"mouth-harp," as she called it. She could reproduce all of her father's fiddle tunes, and she went the city girls one better and "chawed" tobacco instead of gum. She always wore rubber boots and carried a six-shooter in a holster, which she knew how to use. Old Bill had a most wholesome respect for Rose, too. When "Pa," as she called him, disappeared, as he occasionally did, Rose would go after him the next day and round him up. She walked into the saloon at Buffalo Island a few days before we came, where Old Bill was bluffing the crowd and daring any two of them to step out and give him a turn, and took her dad by the ear and walked him out, and pointing to her boat said, "Git in thar and come home." And he got in and went home as docile as any lamb.

Our two weeks' camp came to a close entirely too soon, and it was with sorrowful resignation that we three and the pup sat down on a log watching Jerry put the finishing touches to our plunder before starting for home. It was a glorious trip, and barring the little distemper which Cap. Wheeler suffered for a few days, our health was excellent. I gained nearly five pounds in weight, and the others had just as much to show for the trip, excepting the pup, who had become as skinny as a snake from incessant activity.

We arrived home without incident, and the next day were deep in the confines of stuffy offices, and this is the last of the adventures of four men and a dog amid the swamps of Arkansas.

ROBERT J. SIMPSON.

Po t-Office Thief

A DENVER dispatch to the New York Times says that the mystery of mail box robberies at Spanish Fork, Utah, which has been puzzling the post-office authorities for months, has been solved at last. The robber has been caught, tried, and convicted. For months the mail carriers on a certain rural delivery route in Utah have been troubled by mysterious thefts from a small mail box near the town of Spanish Fork. A day or two ago a circular letter was found in a plowed field. Another was immediately dropped in the box, and a carrier stationed himself near by to watch. In a few minutes a large black raven flew up to the box, struggled through the aperture for packages, and emerged in a few minutes with the letter in his beak. The course of its flight was followed, its nest detected, and there, in a crotch of a big tree, was found all the contents of the pilfered letters. There were drafts, money orders, samples of dress goods, and scraps of love letters.

Riding a Mule.

Editor Forest and Stream:

A correspondent some months ago gave a comical account of an attempt of an old negro to ride a mule, he to get a turkey for his trouble. When reading it I thought of an attempt that I once made to ride a mule, the difference between me and the darkey being that while he did ride his mule, I did not. The mule had originally belonged to the Comanches, we having captured him in a raid that we made on them.

I told some time since of our visits to Catfish Creek to call on these Indians about once each year, our first visit having been made in 1867, at the time I hunted up the man who was lost on the plains, and on this my second visit to it, we got the mule.

A few months after our return from our first visit I left the cavalry, my time having expired, and went down the country to take service as a cowboy. I traveled as far as the little town of Boerne on a wagon, and here I met a negro who had a very good cow pony and a nearly new Texas saddle that he offered me for \$30; and as either the pony or the saddle was worth that, I supposed that the outfit had been stolen; but a storekeeper whom I knew vouched for the negro, so I got his pony and saddle; they were just what I wanted. Then going down near Fort Mason I began work as a cowboy, but only kept at it two months, it did not suit me. We had no fences then in the cattle country, and had to ride the range, and the range being about all the country out of doors as far west as we dared go and not meet Indians, I soon got tired of it. I could have stood the riding part of it, that suited me; but the grub did not. We would have a feast one day and a famine the next, just as we struck the chuck wagon or not; and the driver seemed to put in his time trying to see how often we did not strike it.

When I quit I meant to go back to the cavalry, and would not need my pony; in fact, I would not be let keep him. One of the cowboys took him off my hands, trading me an old Henry rifle and a nearly new Colt pistol for him. These Henry rifles are never seen now; the Winchester is their successor, and in my opinion is not much of an improvement on them. Mine took the old .50-70 Government Springfield cartridge, and I could get all of these I wanted from the infantry for nothing. The captain of the troop I now joined let me carry this gun in the field.

I went to a troop stationed at Fort Griffin; and that fall a large command of colored troops (the 9th Cavalry) paid their usual visit to Catfish Creek. This time the Comanches found them instead of them finding the Comanches. Part of the colored men were lying around camp on the creek one afternoon, while the rest were in the creek bathing, when the Comanches struck them. The surprise was so complete that their commander, Major Bacon, could not rally his outfit, and the Indians drove him clear away from the creek. Major Bacon was a captain in the 9th Cavalry then; in 1898, at the time of the Spanish War, he had got to be a brigadier-general. Two of the men who had been in the creek bathing, got out on the wrong side (it was the right side for them just then) and started on foot for Griffin, some 70 miles away. Their own camp was only 70 yards away, but there were too many Indians around it just then. They got into Griffin days ahead of their command, and reported that they were the only survivors; all the rest had been killed. Within the next twenty-fours at least half a dozen more only survivors reached us, each one of them reporting that he was the only one who had got away, until he was told that they were getting away in large numbers. Our commanding officer put them in one of our troops to be fed. I should have put them in the guard house.

When we got the first report of this terrible slaughter, nobody put on any signs of mourning; the colored troops were in bad odor with us then; they had not been long organized and we did not want them in the service; but after I had got to know them I began to like them. Under as good officers as we had these negroes would go every inch as far as we would any where. I was given charge of a company of the 25th Infantry, colored, one summer; their officer was taken down with the typhoid fever and sent in off a scout, and his company was given to me. We were short of officers ourselves, and no cavalry officer would want a negro company, anyhow. But through the whole of that summer I never had to give one of these negroes an order twice. I have had to repeat an order to white men, then explain it with the butt of a pistol more than once.

Major Bacon got into Griffin in due time, and after refitting here started back again, taking thirty-six of us white troopers under our first lieutenant. We camped one afternoon at Catfish Creek in the very camp the major had been driven out of a few weeks before; and we had not been in camp here three weeks when the Comanches came again. But they did not surprise us this time: our whites had a picket out, the major had not had any when they jumped him. The picket gave us the alarm, and we got our saddles on in a hurry, then climbed up on the plains, where the Indians were mounted, to charge them.

The major stopped that, though. "That gang out there," he told our lieutenant, "is the same blanked outfit that drove my men out of camp here; and now I propose to make my men whip them or know why. You hold this camp."

This did not suit the lieutenant at all. "I have a troop here, sir," he said, "that can whip those fellows in ten minutes, and do it alone if you will send us."

No, he wanted his negroes to whip them, and they did it, while we sat in our saddles looking on and not firing a shot. The negroes drove the Indians out of sight across the plains, then came in again.

Next morning, while we were down at the creek at breakfast, a few of the Indians came again, and our troop was sent out after them. As soon as we took up the gallop they left; then seeing we did not mean to follow them clear to sundown, for we had halted, they came back again, just keeping out of good range. All

they wanted was to get us away from the creek. Their camps were on it somewhere, and they wanted the squaws to be given time to pack up and go. The whole command came out here now; then leaving the Indians to follow or not, just as it suited them, we started up the creek to hunt their camp; but kept up on the edge of the plains while the Indians kept about 1,000 yards behind. They knew just how far our carbines could carry. The Spencer is good up to about 400 yards; beyond that it is of little account. There was one gun here, though, that the Indians knew nothing about just then; they found out all about it later on.

I had my rifle with me and was anxious now to drop out and wake those fellows up.

Along the edge of the plains about every 400 yards, a ravine crossed our trail. These ravines are called draws, and are made by the water in the wet season, when it runs off the plains down to the creek. There is no timber, and there are not often many bushes on the banks. We were coming to one of these draws when the lieutenant dropped back and said to me: "Suppose you drop out of the ranks at the next draw and try that gun on those fellows."

"Yes, sir, I would like to do it."

"Then keep a man with you to hold your horse, and when we have crossed, wait until they get close enough, then drop one or two of them; they won't give you a chance to drop many of them before they go back. Then follow us. Don't stop there too long. If you see them making preparations to charge, you leave in a hurry. We will be close enough to prevent their cutting you off."

When we had got to the draw I dismounted down in it out of sight of the Indians, and as soon as everything had crossed I climbed up, still keeping out of sight, and raising my sight to 400 yards, lay down.

I had eleven cartridges in the magazine, and put another in the chamber. I might get a chance to give them the whole twelve, I hoped I would, I did not need them, I had too many for my horse to carry. The Indians were nearly a quarter of a mile away, but were closing up now. They did not want the column to get too far ahead of them, or not far enough ahead of them, either.

When they had got to what I judged was about 400 yards of me, they stopped all in a bunch. I could not see the column from where I lay, but it had halted. This was what had caused the Indians to halt; they did not want to get too close up; they were too close now, but did not know it just yet.

One of them, riding to the front, turned his pony, and standing up in his saddle, made derisive gestures at the column.

I took what I thought was a good aim and fired, but shot too low. I hit the pony, and it went down, carrying the Indian down with it. He must have got his leg under his pony for he was trying to get from under when my rifle spoke again, and this time I hit him.

The other Indians were going back now as fast as their ponies could carry them, and jumping up I sent them the remaining ten without waiting to take any aim; then going down to my horse rode on to the column.

The officers had been watching me through their glasses, and told me that at least half of my shots had hit either a man or a pony; they thought most of them had hit ponies. The rifle would kill at 1,200 yards if it hit, and I had got the last of my shots fired before the Indians were much more than that far away, so I was not surprised at what they told me. Years after this the Indians themselves told me, not knowing at the time who had done the shooting, that three men had been hit. None of them died, they said, and they had forgotten then how many ponies I had hit, but it was a "heap many." I told the Indians, to account for my interest in the affair, that I had been with these buffalo soldiers when this happened.

We rode down to the creek soon after this, and while we were watering our horses one of our Tonkawa Indian scouts, who had ridden up the valley ahead of us, came in and told us that there was a camp up above; and we put out for it at a gallop.

The camp soon came in sight, but it was only a small one of half a dozen lodges, and across the creek from it a herd of about fifty ponies were grazing. Four Indians were running out to the herd. They had only now taken the alarm. Three or four of us whites and the Tonkawas went for the herd at a gallop, while the negroes fired one volley into the camp, and the shots not being returned, the trumpets sounded "Cease firing." There was no one but squaws and children in the camp; the men we were after and those I had been shooting at back there belonged here.

The Tonkawas shot down two of the men before they had got to the herd; the other two got on ponies bare-backed and left. We need not have let them go. I certainly could run down any pony with the horse I rode; but I did not try, nor even fire at them. The ponies were what we wanted.

About the only charge that could be brought against these Indians was that they preferred to remain wild and not go on a reservation. They raided the settlers, it is true, but only for horses and cattle. I never knew of these Indians burning a ranch. The Kiowas would, though. I would not give a Kiowa nor a Cheyenne quarter. We destroyed the camp next. The lodges were made of tanned buffalo hide. The only way they could be burned was to throw them down, then pile the wood and saddles on them and set all on fire. While we were destroying these lodges I examined them for pistols or magazine rifles; but only found a few muzzle-loaders, which we destroyed. I got several nice painted work bags belonging to the squaws; these were made of buckskin and covered with bead work, and had in them the usual squaw outfit of penknife and scissors and needles; I claimed them and afterward sent them to my women cousins in the East.

It was cold weather now and we were not allowed to carry a blanket on the horse when leaving the post. Some of our men were seizing the extra Indian blankets here. There were plenty of them, but I did not want any; I knew what would be in them; so did these men afterwards, when they had to sleep by them-

selves on our way home, and burn the clothes they wore after they had got home. But I threw my old rope lariat away now and replaced it with a new buckskin one.

After the camp was destroyed we took the squaws, children and ponies, and going down the creek a mile or two went into camp for the night. One of the old squaws had been shot in the arm when that volley was fired into the camp; she was the only one who had been hit; we brought her to the doctor, and when she saw him opening his case to dress her arm, she reached under her blanket, using her good arm, and brought out a butcher knife, and went for the doctor. We caught her before she had time to carve him; and holding her had him dress her arm. She had seen the doctor's tools and not knowing why we had brought her here, naturally supposed he was going to begin his scalping on her.

The next morning the captured stock was divided. Each officer got a pony if he wanted one; the rest were given to the Tonkawas. These Tonkawa scouts were supposed to be half civilized; they were not much more than half-civilized, though.

They were the remnant of a once large tribe that had been by this time nearly all killed off by the Comanches. They and the Comanches were deadly enemies. What were left of them had a reservation at Griffin. They all spoke English and had English names. I had formed a friendship with one of them and had given him part of my name, Anderson.

When the stock was given out our lieutenant took a mule, which he afterward found he had as much use for as he would have for a pair of wings. When we had formed a closer acquaintance with the animal, we found that he could not be ridden, would not lead, and could not be driven with anything shorter than a lodge pole, if the driver did not want his head kicked off. Most mules are safe to handle if you keep close to the head. This one could kick with both pair of feet with equal facility, and he kicked more like a cow than a mule.

After several of us had tried either to drive or lead him, and had failed, the lieutenant told us to let him go, and he went, but not to the place the lieutenant had sent him to. It is not to be found on the map of Texas. However, the mule did not look for it, but went to an old mare the Indians had, and followed her. She may have been his mother. Any time we wanted the mule after this we could always find him where the mare was.

One afternoon on our way home, a controversy took place as to whether or not anyone could ride the mule; and the subject was finally referred to me. I had generally to umpire some sort of a dispute about once a day; at most times it would be one of law or history; to-day it referred to our friend the mule.

One of the men here had given it as his opinion that even the mythical individual who is supposed to preside where the lieutenant had sent the mule, could not ride him.

"I do not know if he can or not," I told them, "I have not the honor of his personal acquaintance, and don't want it, but if you men will catch that mule for me I will see if I can ride him or not."

Oh, they would catch him if that was all I wanted.

"That is all, just catch him and hold him while I put my saddle on him. I will do the rest."

We hunted up the mule, got a rope on him, and by main force dragged him up to a tree, jamming his head close up to it. Then, while half a dozen men kept it there, I put on my saddle. Then forcing the mule back a few feet from the tree, for I did not want to mount him while he could lie up against it and break my leg, I prepared to mount. The "Tactics" give us complete instructions how to mount a horse; they say nothing about a mule. I used these instructions in mounting him; but ignored them altogether when I came to dismount, later on.

Getting into the saddle, I told the men to let him go. They took off the rope, but the mule stood stock still. This was not one of his days for going.

"Give him the spur," one of the men advised.

I gave him both of them, and was liberal about it. This seemed to waken him up. Gathering all his feet into a bunch he made two or three buck jumps, and I dismounted, executing what the Tactics call an "arc of circle" over the mule's head and sat down in front of him. I sat down so hard that for a moment I did not know whether I was here or over in New Mexico. But the mule was still here, and I expected his next move would be to lift me up with his hind feet, so I got up, and the mule left going back to where we had got him from, and as soon as he had got there he lay down to try to roll the saddle off; but did not succeed. I had put it on to stay on.

We had a corporal named Flanigan, an Irishman, and a natural born fool, so ignorant that he could hardly sign his name to the pay roll. He had swallowed all the big words he found in the dictionary and used them in his conversation, generally getting hold of the wrong word. The men hated him on account of his propensity for reporting them for punishment, or often giving the punishment first, then reporting it afterward. A "non-com" then had more authority in that respect than his officer now has; he could tie a man up, buck and gag him, or give him a log to carry, for any or no offense whatever. It cannot be done now though. He had never tried to punish me yet. He was continually making mistakes that laid him open to punishment himself, and I kept telling him of them; he seemed to be afraid of me. He was reduced to the ranks soon after this, and I was appointed in his place. That hurt him more than his reduction did; he had been expecting that, but I was only a "recruit" here.

The lieutenant was heard from now. "Corporal Flanigan," he called out, "Send me the man who owns the saddle on that mule there."

"The littenint wants ye," he told me, "an' it's meself as is of the opinion that he has a log for ye. It will afford me a great deal of pleasure to give ye a heavy one. Ye have earned it, me bucky; ye are so darn smart, me boy, that I want to correct ye meself." "Very good, corporal, but don't go to hunt that

log before you get the order. He may not give me one after all; he don't give me many, you know."

He had never given me any and did not give me one now. These logs were carried on the shoulder, under the eye of the guard, for punishment. When I was provost-sergeant at this post of Griffin, I had a pet boy, a trumpeter named Gray, who would be sent to me about every other day to be made carry a log. I had a log that I kept for him; it looked as if it weighed a ton; it really weighed ten pounds, being a mere shell plugged up at each end. Going up to the lieutenant, I saluted him and stood at attention.

"Is that your saddle on that mule?" he asked, pointing to the mule, which lay on his back, or as near on it as my saddle would allow him with his feet stuck up in the air.

"Yes, sir, it is mine."

"What is it doing on that mule?"

"I was trying to ride him, sir."

"Well, did you succeed?"

"No, sir, he threw me."

"Of course he did. Now don't you know, by this time that you or no one else can ride the blanked mule? Had I wanted you to ride him you would not have been half as anxious to do it as you seem to be. Catch him, now, and get your saddle off him before he breaks it for you. If you can't catch him yourself get those men to help you. They were willing enough to help you when you wanted him caught before." He had seen the whole affair.

We surrounded the mule again, got another rope on him, got him up to the tree again. I dared not go within ten feet of him unless we had him snubbed up to something. Then I got my saddle and bridle off and let him go. He was afterward given to the Tonkawas, but after he had half-killed several of them they shot and ate him.

CARIA BLANCO.

As to the Red Gods.

Editor Forest and Stream:

Since Mr. R. W. Ashcroft returns to the justification of his condemnation of Kipling's poem, and to the support of the assertions of his "alter ego," L. F. Brown—of Sand Lake, Michigan, whose violent words he maintains were "legitimate literary criticism," I think it may be in the interest of all concerned to call attention to the fact that legitimate literary criticism is not secured by misrepresentation or evasion of points under discussion.

Mr. Brown asserted that "A bar is always a deposit of *alluvium earth-sediment*, which has gathered and formed a *mud bank* or *island*." (The italics are mine.) From this deliberate and sweeping statement of his own I was surely justified in my inference that, according to his own words, Mr. Brown had never seen or heard of such a thing as a sand bar, although the term is one of the commonest in the language, and the thing referred to as common and generally known as anything that could be named.

Mr. Ashcroft says "this is all fog," though it is impossible to detect any fog in regard to the whole matter save that which Mr. Ashcroft and Mr. Brown have tried to raise.

Perhaps the chorus of indignant responses which their letters called forth may suggest to these gentlemen that the world-wide reputation of the most acceptable story-teller and poet of the present time was not based upon "blindness to nature's beauty and grace," "mistruth," "inexactness," "misdescription," "rhyme-tinsel," "daubed chromo" picturing, "intentionally distorted and brulesque description," "just such false work" as the burlesque doggerel "Caramel," "fakir vociferation," "squawking of a brood goose on addled eggs," etc., etc., to quote no more of the ribald epithets of these "legitimate literary critics."

To ascribe to Mr. Hardy and myself a mesmerized condition which makes us "consider it sacrilegious to criticise" any of Kipling's productions on account of "a divinity hedging about him," is quite gratuitous. Our willingness to criticise anything else of Kipling's has been in no wise tested or called into question by anything in this discussion.

A poem generally accepted and enjoyed, not only as one of great beauty of poetic conception, but of singularly accurate epithet and description of nature, has been assailed with a rudeness and violence to which readers of FOREST AND STREAM are quite unaccustomed, and which has called forth protest from those who will not permit the "critics" to retire under any "fog" that they may try to raise. Mr. Brown's "circular letter" on the question of canoe-poles, so far as it is addressed to sportsmen in "India," "Norway," "Australia," "Finland" and points in the "upper Amazon Valley," may elicit facts of interest to Mr. Brown, and perhaps other, but none having any bearing whatever on the point at issue, viz., as stated in Mr. Brown's own words, whether Kipling was a "fakir when he wrote the nine words":

"To the click of shod canoe-poles round the bend."

Everyone who has read the poem, "The Feet of the Young Men," knows what part of the world is described by each division of the poem, and what is meant by the "Four Way Lodge."

He also knows that the land of "the blackened timber" and the "raw right-angled log jam" and where the "shod canoe-poles" "click," and where we shall find the "silent, smoky Indian" and the "couch of new-pulled hemlock" is not in "India" or "Norway" or "Australia" or the "Upper Amazon Valley," and that Kipling's lines are not responsible for the customs of boatmen there, whatever those customs may be, and that the attempt to divert attention to them in the effort to support a hasty and mistaken statement is the thing that "is all fog." From the land to which Kipling's words apply, we have already heard a chorus of approving voices, and on their testimony the poet's use of words is abundantly vindicated.

He has seen the shod canoe-pole and heard its click—and knows that thousands of other men have—and with the best warrant in the world he coins his truthfully

descriptive phrase, and not in vain offers it for the recognition of his fellow lovers of the forest and the stream. The discovery of other men who have not seen these things, however much they may claim to have "been exposed," or the discovery of parts of the globe where the phenomena in question are not found, has no bearing upon the question.

And now one wonders what poet could safely put pen to paper if his readers generally were almost to exhaust the vocabulary of complaint and abuse whenever a word or line of his failed to tally exactly with their own inexperience.

A friend of mine, who is fond of paradox and puzzle used to suggest the conundrum of what would happen in ecclesiastical circles and affairs if the Pope should turn Unitarian! A puzzle of similar difficulty for my imagination is suggested by the thought of what these gentlemen, whom Kipling's innocent words have so offended and stirred to such fury, would do for adjectives if they should ever happen to take up a poet who sometimes makes real blunders or uses mixed or indefensible figures, yet has for ages been accounted great.

It would never do for them to read Shakespeare, for instance. Can it be believed that should they encounter such a phrase as "to take arms against a sea of troubles," they would survive the shock?

These things I am moved to say, not because I consider Kipling infallible or unamenable to candid criticism, however severe, but as in opposition to violent words and impeachment of motives whenever an author's choice of words may not seem the best, and as against hasty generalization from insufficient data.

But Messrs. Brown and Ashcroft are ready, solely on the basis of their own experience, or lack of it, to make the most sweeping assertions and denials, covering in their statements the experience of all other men. Though sand is the traditional substance of a river bar, Mr. Brown asserts that a bar is *always* of different material, and Mr. Ashcroft, with equal fatuity, and when it would seem that he must know that every real camper in the wilderness would laugh in his face as he says it, will have it that "the real sportsman likes the starlight on his face as he angles at night for big trout, or mingled with the light of the camp-fire as he smokes with a comrade beside it, or as he sits in the canoe while he and his guide return to camp, but *never* while sleeping on a bed of boughs"! I am sorry for any man who thinks he has had the deep experience of the wilderness if he has not lain many a night with the starlight in his face, and unsheltered by "canoe, tent, cabin, shack or lean-to." In fact, Mr. Ashcroft's assertion that the real sportsman always sleeps so sheltered—good though shelter is in time of need—but thousands of times not to be had, and in good weather not needed and often not desired, gives, perhaps, the clue to the peculiar experience and point of view of Mr. Ashcroft.

C. H. AMES.

Boston, Mass.

NEW YORK, Oct. 30.—*Editor Forest and Stream:* Having just returned after an extended trip through New Brunswick hunting moose, it was but natural that I became interested in the Kipling controversy now going on in *FOREST AND STREAM*.

After reading the able articles by The Old Angler, Mr. Hardy and others, I find that there is nothing to add in defense of those twelve grand and true lines of verse as written by Kipling, only to say that I heartily agree with The Old Angler in saying that it is, without doubt, to my knowledge the grandest piece of verse ever written on the subject, and one that will appeal to all sportsmen who have had the pleasure of enjoying the life he so vividly describes.

Were Mr. Ashcroft or Mr. Brown to take the trip that I have just completed, through most of the country that was covered by E. Hough in the late fall of 1901, a trip in which I traveled 150 miles of country on the Little Tobique, Nepisiguit and Upsalquitch waters, 120 miles of which was by canoe, they would see many a sun-warmed shingle; also, by the way, they would have enjoyed a midday meal on some of them, and Mr. Ashcroft no doubt would have been annoyed more than once by the click of the shod canoe-pole; he also would have been enlightened as to the use of them, not only in going up stream, but in coming down as well, when the paddle is laid aside and the canoe-pole, steel-shod, comes into play to retard the speed of the canoe whenever the ledges, falls, or other rocky or dangerous parts of the stream are met with and must be gone through, where anything but a steel-shod pole is out of question.

Mr. Ashcroft writes that no genuine sportsman, being poled up stream, would submit to the annoyance of the click of the shod canoe-pole for fear it would frighten away game before he came in sight. To which I would say that your chances for game in that way is increased one hundred per cent. If you were to walk along the lumber road which follows most streams in that country, about two hundred yards ahead of the canoe, then any game so frightened would very likely cross your path, and perhaps give you a shot, as has happened many times in that country. At any rate, it would be acting more like a genuine sportsman to the man at the pole than to sit in a canoe and be poled up a rushing, roaring, tumbling stream at the rate of about two miles an hour.

Then when night overtakes you, after your long day's walk, and you lie with your feet toward the burning birch log, perchance you may want something better than a "couch of spruce."

OTTO KEIM.

Editor Forest and Stream:

The Octogenarian, in his eighty-third year, no longer able to obey the call of the "Red Gods," which he feels as keenly now as he did at twenty, loves to read and muse about the scenes and experiences of past days, and compare the modern ideas of sport with those that prevailed in his youth and early manhood. Nothing that he has read of late years has so surprised him as the musings of those two up-to-date sportsmen who have recently aired their knowledge in criticising that wonderful little idyll in which a lover of nature, a poet and a true sportsman, paints a series of word pictures which excite the admiration of every true woodsman.

But, alas! this is the day of electricity—the day of automobiles, when rude force and brazen assertion dominate modest knowledge, and where "villainous dynamite" shatters the word of truth. The youth browbeats his father; the matriculant at the curriculum usurps the functions of the preceptor, and the *jeunesse dorée* run down and smash whatever obstructs their impetuous and reckless career. Thought and behavior tally with the impulses of the age. The magnates of to-day look on the *hoi polloi* as rubbish. Money rules and the panacea for all they smash is—"How much to pay?" The rule of the road for automobiles is to settle on the spot for damage done to bodies and buggies—human and horses! In this state of things modest knowledge has no chance when it tries to correct the errors of certain would-be critics. There are men who, without experience of what they prattle about, claim to "know it all," and, taking the floor first, seek to palm off their patent ignorance as the sum of technical knowledge and skill. These men measure their own knowledge by the extent of their travels, just as they determine the number of stars in the firmament by the few they see at dusk or at dawn. Having the testimony of their uneducated eyes they *know*, and any attempt to correct the errors of their limited vision makes the man who exposes their ignorance a liar. If their "half baked" guides made their beds of spruce boughs, then spruce is to be the woodsman's standard. If some boatman pushed his unaccustomed craft about with a half-peeled sapling cut near at hand as a make-shift, that establishes the fashion for push-poles in all waters. If their voyaging has been, for the most part, down stream, they may ignore the existence of setting-poles altogether. If they have seen any considerable number of logs "hung up" in midstream where the water ran off suddenly and left them stranded, they call that a "log-jam," and suppose that, from these, the poet painted that wonderful word-picture—"the raw right-angled log-jam at the end"—which everyone who has ever seen it will recognize with a thrill!

These musings are the result of reading, in your issue of October 24, the second paper of R. W. Ashcroft, in which he invites Messrs. Hardy and Ames, and of course your other intelligent contributors—the Hermit, Von W., Dixmont, R. T. Morris, Newfoundland, and F. P. Biddle, all old woodsmen—to read an editorial in the New York Evening Post and there learn how little they know of woodcraft! This is amusing; but when he tells us of his "circular letter" to sportsmen who have used canoe-poles in India, Norway, Australia, Finland, Alaska, British Columbia, Ontario, New Brunswick, Cape Breton, Newfoundland, Labrador and several points in the Upper Amazon Valley, that is going to convict us all, as well as Kipling, of ignorance of the racing streams of Maine and New Brunswick, of which alone we wrote, the "force of folly can no further go!"

Mr. Hallock writes to me in his quaint, honest fashion: "The story of the forest is as simple as the lives of its denizens. It is so simple that it cannot be parodied without instant detection by all who have matriculated as students and enjoyed a few terms of its fascinating curriculum. Every observing sportsman who has passed his novitiate with Red Gods on racing streams running through forests, knows that the impact of the current strikes the bank at the bends at right angles, and the logs, following the current and stranding at the bends by the free ends swinging across the stream to the opposite shoal, make a 'right-angled jam' which is the correct and picturesque term which Kipling happily used in his charming idyll, while the addition of the single word *raw* paints the whole landscape upon which I can shut my eyes as I write and see before me with this sole raw spot on its face."

"As to setting-poles, the voyageur or skilled canoe-man is as fastidious about his own as an expert angler is about his rod, or a skilled billiardist about his cue. So far from being content with an indifferent or unwieldy implement, he is careful to have it well balanced and as stiff as it is light. Having procured some spruce saplings to his liking, he carefully fashions them to his taste with his crook-knife, spending much time over them. Having got them into shapes and proportions to suit his individual judgment, the canoe-man is not likely to use them up in a few hours by splitting the ends against rocky bottoms or over stony rapids; therefore he protects them with iron thimbles or shoes." How often have I seen Sachem Gabe or Peter Metallic drop back to recover the shoe from a broken setting-pole, and spend both time and trouble to retrieve it from the submerged cleft of rock into which it had been driven in surmounting "the three-mile rapids" or fighting their way up quick water, yclept "shove-and-be-d—d" on Southwest Miramichi!

In reply to a question asked last week of Mr. Charles Hallock, whose canoe experience is, perhaps, more extensive than that of any of the Old Guard now living, he wrote: "I have never seen either an ash or a maple canoe-pole. Spruce, white cedar and fir saplings are considered best in the order named. Nor did I ever see any but iron ferrules or shoes. Copper was, however, used by our prehistoric aborigines for this purpose, as well as for many other implements. This was probably before they understood working in iron. I have seen these copper implements in a private collection."

In my last letter I gave an extract from Mr. Hallock's "Fishing Tourist" as to the click of the canoe-pole. I now give one from George Dawson's "Pleasures of Angling," published in 1876. At page 52-3, describing his first visit to Grand Cascapedia, he says: "A novel, picturesque and exciting scene was presented as our six canoes moved off in Indian file up the rapids of the Cascapedia. The poles used are tipped with iron tubes, and make pretty music as they strike upon the pebbly bottom of the river in perfect time." If this is not oftener alluded to by sportsmen, it is simply because it is too common to deserve special mention.

"Would-be critics," Mr. Hallock adds, would do well to study acoustics a little before venturing to deny that the click of shod canoe-poles can not be heard in a racing stream. It can be as readily and distinctly heard as can the sharp crack of the rifle when artillery is thundering in front. A sportsman can never bag ducks when poling up the stony and gravelly bottom of a stream. Long before he rounds the bends where the ducks are feeding, the click of the poles has given them warning, and as the bend is turned he sees them scooting along the surface

of the water or over the trees to the nearest cover. Not one in a hundred of those sportsmen who write of their forest and stream experience knows the secrets of the woods, or could keep alive a week if lost and left to his own expedients. The majority of them could not even make a fire in a rainstorm! Many of them are deft with the kodak, and some produce very beautiful pictures, which are by far the best parts of their descriptive writings. Such sportsmen could press the button which starts the machinery of a world's exposition, though they don't know even the parts of the engine by name, and this is about the size of those critics who find fault with Kipling's superior knowledge of nature and of woodcraft and of word-painting. If they have never seen a shod canoe-pole, how, in the name of common sense, do they know whether it clicks or not?"

These are some of the musings incited by the last attempt of Mr. Ashcroft to bolster up the jejune criticisms of his friend. If they are persons of common sense they will "read, learn and inwardly digest" the letters from real woodsmen that appear in your issue of October 24, and abstain from any further display of their lamentable ignorance.

THE OLD ANGLER.

Editor Forest and Stream:

The vast army of able and strenuous defenders of Kipling who have risen up amuse me. Like Mr. Brown, I think Mr. K. has more of rhyme and jingle than of sense, though "sun-warmed shingle" and "silent smoky Indians" seem sane enough. When any of my friends get delirious over Kipling, I accuse them of playing the grand stand, and that impression sticks to me in spite of any argument so far advanced. Now, these able defenders of Kipling can remove this impression and vindicate themselves by separately and independently answering the following questions, making the answers agree: What was meant by "the Red Gods have called?" What is "traces" in connection with "rods and reels?" What is "a raw log-jam?" What is a "right-angled log-jam?" What does "at the end" mean? Make your answers as easy to understand as Mr. Brown's poem that appeared in *FOREST AND STREAM* recently. You need not try to use the same elegant language, just make the sense stand out that way. Now, no getting together and agreeing. Make it clear to *FOREST AND STREAM* readers that there has been no mutual understanding and make your answers plainly agree and you will convince me that Mr. Brown ought to go away back and 'sit down.

DURHAM, Kan.

E. P. JAKUES.

Natural History.

Carcase-jour.

Editor Forest and Stream:

I note your inquiry after that "old French word signifying glutton," of which your correspondent in last issue claims the word *Carcajou* to be a corruption, as applied to the wolverine. Of course there is no such word in the French vernacular from away back. *Carcajou* is a coined word, like maskinonge, whose derivation was born of occasion. It is a composite French and Indian word originating in Canada, and introduced across the line into Michigan and Wisconsin, and perhaps into Vermont and Maine, where alone of all the States it is known and used. To trace its inception the philologist must go to the *courriers du bois*, or wood runners, French and Indian, who hunted and trapped together for the fur companies, and thereby mingled their fancies and their dialects.

Wolverines or gluttons are such inveterate plunderers of set traps, and so difficult to catch in them, or out of them, that they are known in backwoods parlance as "Indian devils." Fur hunters had to get up early in the morning (*le jour*), as the saying is, in order to kill or capture one; and when a varmint was found dead, the successful trapper exclaimed in his elation, calling to his customary partner, or companion on the lines, "*carcase-jour!*" words which sound like "carcajou" at a little distance when spoken quickly, and equivalent to "dead meat soon," meaning that they did not have to wait long. All this I learned orally forty years ago in the wilds of New Brunswick on trappers' lines.

All Indian proper names, appellatives, sobriquets and nicknames are expressive of incidents, peculiarities, or characteristics, and are very often used in caricature. Usually, in phrases formed through association of races, the aborigine took the trait, and the dominant language the designation. Besides, the Indians were a silent race, and the French loquacious. This accounts for the grafting of so many French words into the northern Indian dialects. In the Chinook vocabulary fully one-third of the words are of French origin.

WASHINGTON, Oct. 27.

Editor Forest and Stream:

In your issue of Oct. 24 a writer, communicating information about the wolverine under the above heading, says: "If Mayne Reid ever wrote of the carcajou and wolverine as two different beasts, he erred."

Captain Mayne Reid's knowledge of natural history subjects was deep and wide, acquired from extensive travels (in America among the Indians and trappers) and extended research and study. He rarely erred in his statements of facts. Here follow his comments regarding the wolverine, taken from his "Young Voyageurs," first published in 1853:

"The Canadian voyageurs call the wolverine 'carcajou,' while among the Orkney and Scotch servants of the Hudson's Bay Company he is oftener known as the 'quickhatch.' It is supposed that both these names are corruptions of the Cree word, okeo-coo-haw-gew (the name of the wolverine among the Indians of that tribe). Many words from the same language have been adopted by both voyageurs and traders."

What is "the old French word signifying glutton?" Let your correspondent rise and explain.

CHARLES H. COE.

LANGDON, D. C.

Eland for Australia?

THE largest and most bovine of the antelopes is the African eland (*Oreos canna*), formerly abundant on the high dry plains of Southern Africa, but now extinct in Cape Colony, Natal, the Orange Free States, the Transvaal, and almost exterminated in all the countries to the west of the land of the Matabele watered by the river Limpopo or its tributaries. At one locality in Natal, however, it still exists, and there is carefully preserved.

The reason for its extinction is found in the value of its hide, and the animal has been persistently pursued for it, and in its southern range has been exterminated just as was our buffalo.

The male eland stands not quite six feet high at the withers, and his horns are 2½ feet long. The general color is a bright yellow tan, the elands from some districts having white stripes on the sides, which remind one of the harnessed antelope of Africa.

The name eland obviously comes from the word elk, as suggested by Schweinfurth, who adds: "But, however little, as far as regards either the color of its coat or the shape of its horns, the *Oreos* may have in common with the elk, still I must confess that by its size it could not do otherwise than remind one of the stately game of my Livonian home; and the shaggy hair hanging in full crop from the neck, the bushy bristles on the forehead, and above all the thick black mane upon the withers, all combined to increase the resemblance. Far more striking, however, is the analogy of this animal with the zebu races of Africa, which exhibit many points that are common to the whole type of antelope. The short leg, the elevated long body, the long hanging dewlap, the hump-shaped withers, and the light bay color of the skin are characteristics of this race that justify a comparison of the eland with them, far more than with the elk."

The eland is still found sparingly throughout the Mozambique Province, and is numerous in Portuguese Northern Zambesia, and still more so in the Ruo and Lower Shire districts of British Central Africa. In these regions the striped form known as Livingston's eland is the one commonly met with, although this striping is not constant, for in the same districts some elands are striped and others not. The females and young animals may be of various shades of yellow dun and tawny, the bulls being much darker, almost a blue. During the dry season these antelope go in large herds, but during the rainy season are more frequently found in pairs or small herds of five or six.

In Central Africa elands frequent the open forests, but during the heat of the day usually lie up in the thick grass jungles. They are eager feeders, and after the rains become very fat, so that Mr. Vaughan Kirby declares that at this time the flesh is not surpassed by that of any wild game. The calves are born, according to latitude, between August and November, which, of course, is the spring season there. Mr. Vaughan Kirby shot a bull in Chirimani's country which measured 5 feet 10½ inches at the shoulder.

As to the hunting of this species by the natives, it is said: "Of all the antelope the eland, especially the male, is the most lusty and well fed, its heart having been known to be imbedded in a mass of fat weighing twenty-five pounds; the animal is consequently generally so short breathed that it can be readily overtaken or speared. The Masarwas are very fleet footed and skillful in handling their assagais so as to mortally wound the heart or lungs. Mounted Dutch and English hunters chase the elands in the same way as giraffes right up to their wagons, where they shoot them down, thus sparing themselves the trouble of having to transport the skins or carcasses from the hunting grounds. I have been told by hunters and natives, and I think it quite credible, that without any great difficulty elands may be tamed and trained to draw or carry light burdens."

With this we print the head of an eland, which we owe to the courtesy of the Ward's Natural Science Establishment at Rochester. A small bovine animal now to be seen at the New York Zoological Park, known as *Anoa depressicornis*, somewhat resembles the eland in general characteristics, although very much smaller. Within a few days the Zoological Society has received, as noted in last week's FOREST AND STREAM, a splendid bull eland, said to weigh about 2,000 pounds. It may now be seen there with many other African antelopes.

It is reported that an effort is to be made to introduce the eland in Australia, the Province of Queensland having been chosen. Queensland has vast areas of brush land, which is practically useless on account of the lack of water, and it has been thought that the elands might do well there, for it is a popular belief that they can get along without water. Mr. Vaughan Kirby says: "They are almost independent of water, for I have found them in absolutely dry tracts of great extent; nevertheless if water is at hand, they invariably drink at least once a day." Mr. Charles J. Copley advises us that the Earl of Derby, who is said to possess 4,000 elands, has given Queensland 1,000 of these animals, and has paid the expenses of their transportation thither.

Lower California Mammals.

IN 1902 Mr. Edmund Heller, collector for the Field Columbian Museum, made a trip into the San Pedro Martir and Hanson Laguna Mountains and along the neighboring coast region of Lower California for the purpose of gathering material for the museum. His trip began in February, 1902, and was made with pack animals. The country which he entered is unsettled, and it is necessary to carry supplies in considerable quantity, since nothing can be bought. A Mexican law provides that all persons bringing guns into Lower California must return every sixty days to the port of entry, and there have their permits to bear arms renewed. It may be imagined that such a law would be a tremendous handicap to any one who wished to explore the long peninsula of Lower California. Burros do not travel rapidly, and the distance which they can cover in thirty days is not great. However, on his first return to Ensenada, Mr. Heller learned that a special permit had been issued to him by the Secretary of State of Mexico, permitting him to carry arms without any time limit being mentioned, wherever he might choose to go in Mexico. He was therefore enabled to turn about and devote the remainder of the

specimens were taken. Many of our readers will remember the graphic account of sheep hunting in this same region entitled, "To the Gulf of Cortez," published years ago in FOREST AND STREAM by Mr. Geo. H. Gould. It was subsequently reprinted in the volume of the Boone and Crockett book entitled, "Hunting in Many Lands." That account was of very high interest, and it is gratifying again to read of the sheep inhabiting this special region.

Of these sheep, Dr. Elliott says: "I refer all these specimens to the form described by Dr. Merriam from the Grape Vine Mountains, boundary line of Nevada and California, with some doubt. It is very difficult, merely from a brief description, to determine with any certainty whether two closely allied individuals from widely separated localities are of the same species or not, and as there are already too many named forms of mountain sheep, I have no desire to introduce another doubtful one, and for the present, at all events, prefer to retain these specimens under the above name, until they can be compared with topotypes of the race named by Dr. Merriam, and a satisfactory decision be reached. The San Pedro Martir sheep is a small animal, with all the under parts,

except a small white patch on the inguinal region and front part of fore and hind legs, blackish brown. White rump patch very large and not divided in the middle." Mr. Heller's notes on this species are as follows:

"Common about the cliffs, coming down occasionally to the water holes in the valley. Most of the sheep observed were either solitary or in small bands of three to a dozen. Only one adult ram was seen, all the others, about thirty, being ewes or lambs. The largest bunch seen consisted of eleven, mostly ewes and a few young rams. The sheep, as a rule, inhabit the middle line of cliffs, where they are safe from attack above, and can watch the valley below for danger. Here about the middle line of cliffs they are observed, and the greater number of tracks and dust wallows where they spend much of their time were seen. A few were seen on the level stretches of the mesas, and a considerable number of tracks, but these were made by those traveling from one line of cliffs to another. They are constantly on guard, and very little of their time is given to browsing. Their usual method is to feed about some high cliffs or rocks, taking an occasional mouthful of brush and then suddenly throwing up the head and gazing and listening for a long time before again taking food. They are not alarmed by scent, like deer and antelope, the direction of the wind apparently making no difference in hunting them. A small bunch of six were observed for a considerable time feeding. Their method seemed to be much the same as individuals, except that when danger was suspected by any member he would give a few quick leaps and all the flock would scamper to some high rock and face about in various directions, no two looking the same way. These maneuvers were often performed, perhaps once every fifteen minutes. Their chief enemy is the mountain lion, which hunts them on the cliffs, apparently never about watering places. Lion tracks were not rare about the sheep runs. They are extremely wary about coming down for water, and take every precaution. Before leaving the cliffs to cross the valley to water, they usually select some high ridge and descend along this, gazing constantly at the spring, usually halting ten or more minutes on every prominent rocky point. When within a hundred yards or less of the water, a long, careful search is made, and a great deal of ear-work performed, the head being turned first to one side and then to the

other. When they do at last satisfy themselves, they make a bolt, and drink quickly, stopping occasionally to listen and look for danger. If, however, they should be surprised at the water, they do not flee at once, but gaze for some time at the intruder, and then go a short way and take another look, and so on until they break into a steady run for the cliffs. At least thirty sheep were observed at the water, and none came before 9:30 A. M. or later than 2:30 P. M., most coming down between 12 P. M. This habit has probably been established to avoid lions, which are seldom about during the hottest part of the day. A few ewes were seen with two lambs, but the greater number had only one. Most of the young appeared about two months old. Their usual gait was a short gallop, seldom a walk or trot."

Of rats, mice, gophers, jumping rats and rabbits, Mr. Heller collected many specimens. Wildcats were obtained belonging to the California Bay lynx type, and three species of coyotes, one of them new and named by Dr. Elliott *Canis clepticus*. The California form of the gray fox was taken, with some small skunks, shrews and bats. This collection has yielded several new forms, described by Dr. Elliott.

Besides the species taken, there have been found in the region the puma, or cougar, whose tracks were often seen, and which is said to prey on deer, sheep, and young stock; the raccoon, skunk, weasel, the sea otter—said to be now very rare off the coast near San Quentin, but to be occasionally taken—the sea lion, and a seal. The paper is illustrated by plates of scenery and a sketch map.

THE ELAND (*Oreos canna*).
Specimen from Moshonaland.

year to collecting. He made considerable explorations, and collected a very valuable series of mammals both from the mountain and the coast region, bringing out more material than has probably been collected before in this particular region by anyone. Mr. Heller's description of the country is quite full, and his report accompanies Dr. Elliott's paper, which is based on the collections here made, and forms No. 12 of Vol. III. of the Zoological Series of the Publications of the Field Columbian Museum. The paper bears date June, 1903.

Among the specimens secured is a young male mule deer of two or three years, which has a pure white tail with a black tip. Heretofore the specimens killed in this region have all been attributed to Caton's California mule deer, and this specimen remains unique for the region. It was killed in the low lands near San Quentin. Although killed on the 4th of August, the horns are dark and hard, as if the velvet had been shed for some time, and the coat is that of autumn.

A large number of specimens—fourteen in all, chiefly killed in the mountains—are referred to Caton's California mule deer. These are of all ages and sizes, and appear to average smaller than the common mule deer.

A single antelope, belonging to the form described by Dr. Merriam as *Antilocapra americana mexicana*, was taken near the Gulf of San Felipe, Gulf of California, and the animals are said to be not rare, though, on the other hand, they are not numerous. "The Indians report seeing as many as fifteen occasionally in a band."

Of the mountain sheep of Lower California, thirteen

Visits with Apes and Monkeys.

III.—Visits with New World Monkeys.

WITH the exception of the marmosets, which can be distinguished from all other monkeys, by their pigmy size, and long, sharp claws on all fingers and toes—except the great toe—the New World monkeys can be told by the following prominent differences:

The wide partition between the nostrils and the lack of naked callosities. In size none compares with the largest monkeys of the Old World. While they also lack cheek pouches, one cannot detect this without a close inspection. Should you see a monkey while attempting to elude pursuit, carrying some small article in his hand which he could easily put in cheek pouches, you would be safe in concluding that he came from tropical America; or should you see him hanging by his tail, or using it to grasp, you can rightly come to the same conclusion, for no Old World monkey has a prehensile tail, neither do all American primates. Another feature, if you could examine their mouths, you would find that American monkeys have thirty-six teeth, while the others have but thirty-two.

Nature has played some funny pranks with the monkeys. As has been seen, many of the Old World monkeys have cheek pouches, and all possess naked callosities, while those of the Western Hemisphere lack both. The spider and wooly monkeys, howlers and capuchins—American monkeys—are the only ones that have prehensile tails, and as if to partly balance this great advantage, which really is equal to a fifth hand, nature in several cases, and not in others, has taken away their thumbs, or given them but rudiments. With a group of African monkeys—the thumbless monkeys—she has been so mean as to deprive them of prehensile tails and thumbs also. What a mess!

The monkeys of the Western Hemisphere are of mild disposition; even when their capture is attempted, instead of resisting the keeper and fighting to the last, as many of the Old World monkeys generally do, they show great fear, and when captured scream with fright until convinced that no harm is to befall them. They make friends easily and can usually be trusted.

Of the few representatives in the London Zoological Gardens, the most intelligent were a pair of smooth-headed capuchins. They were known to their friends as the "Jimmy monkeys." Their looks and actions were so nearly alike, that a description of one monkey will suffice for both.

I did not make many visits to the building before this little fellow began to recognize me, though he had always been friendly. His cage was large and contained many other primates. Even though at play when I entered, he always came to say good morning, and with a very serious, yet amusing expression, he told in monkey language and actions how glad he was to see me. After such an outburst of pleasure, he played with my watch and chain, and when I left him he followed to the end of the cage and continued his chatter. He was extremely jealous of his companions, and would attack any that came near. As long as the monkey ran he would chase it, but when it turned, he lost his nerve and hurried to me for protection, then would face about and suddenly become very brave, looking back to see if I had deserted him.

He must have envied the Old World monkeys their cheek pouches, for when given two or three large English pennies, he was at a loss what to do with them. When he came to the front of the cage the human monkeys tried to take them from him, and if he climbed to the perches, the other monkeys clustered about. Sometimes he carried a penny in his mouth and the others in his hand; again he would hobble about on three legs with the coins clasped against his breast. He would hammer them on the iron cross-bars, and often tried to crack English walnuts in the same manner.

Nothing pleased Jim more than raw eggs, and the skill with which he handled them was really remarkable. On being given one he carried it to a perch, and clapping it with both hands, carefully cracked one end on the bar, picked the shell open, and, raising the egg above his head, he tilted it, and lapped the flowing contents, allowing little if any to waste. While endeavoring to escape pursuers, he sometimes crushed the egg, and in his eagerness to save the yolk, covered his hands and face, and was a sight indeed.

Rats had gnawed a hole in one corner of the cage and at night carried off nuts and bits of bread. One day I noticed a number of monkeys seated in a circle around the rat hole; presently a rat appeared, and the monkeys scampered away. Jim was the only one that held his ground. He stood a few feet from the hole, and when the rat returned, Jim waited until he had ventured several feet from the hole, then quick as lightning caught the rodent, and before it had time to bite him, he buried his teeth in its skull. He spent the afternoon chewing its head and hammering it about the cage, refusing to yield his prize until compelled to.

I took a four months' trip on the Continent, and on my return was told that one of the Jimmy monkeys had died. His mate had been transferred to an adjoining cage, which I passed, and while looking for him I was greeted from behind by his familiar voice, and for several minutes he sent forth a perfect warble of notes, sounding more like a bird than the harsh cries usually heard from monkeys.

All the monkeys took pleasure in teasing and frolicking with cage mates, but none was so persistently buffoonish as a pair of brown spider monkeys. Their slim bodies, extremely long limbs and slender, prehensile tails, made their actions all the more ridiculous, and they held a crowd of interested spectators constantly about them. Always active and looking for a chance to make the lives of their associates miserable, they never lingered long with any one visitor.

The ease with which they swung hand over hand about the cage gave the onlookers some idea of the gracefulness with which they handle themselves when moving among the trees in their native forests.

They took great delight in teasing a young weeping capuchin, probably because he was unable to defend

himself, and finally so intimidated him that when a spider moved in his direction he squalled at the top of his lungs. While he was peacefully seated in a corner watching the visitors, one of the spiders would hang by his tail, reach down and catch the capuchin by his tail, and after swinging him about in mid-air, toss him upon the straw, or, crossing the floor like a huge spider, took a position in front of the squalling capuchin and snatched at him, first with one hand, then the other, then suddenly catching him by the tail, hauled him into the center of the cage, and watch him scurry back to his favorite corner. Finally the attendant was obliged to remove him to another cage.

I have seen one of these spider monkeys swing back and forth on a rope, and at a favorable opportunity catch the tail of a capuchin that was holding to the side of the cage. When the spider swung back the momentum wrenched the capuchin's feet loose, and then he hung, suspended in the air, clinging by his hands while the spider held him by the tail. The monkey that succeeded in keeping his position on the perch while a spider was passing, was fortunate indeed.

The collection of American monkeys was small, and with the exception of the two species mentioned, uninteresting and not worthy of notice.

Before closing this chapter I should like to give the reader some idea of what the monkeys in some zoological parks have to contend with, taking, for example, the gardens under consideration.

In the morning school children entered free of charge; they came in droves, accompanied by their teachers, and were marched through the buildings double file. As soon as the monkeys saw them they passed the word from cage to cage, and as the children entered shouting and laughing, the house was thrown into an uproar. The monkeys sprang to the sides of their cages, and as the children moved along they were met by defiant looks and cries. After their departure it was some time before the monkeys quitted.

In the afternoon came the regular visitors, some of which had less sense and certainly less feeling than their predecessors.

One would be astonished if he knew the number of grown persons who delight in tormenting, and in some cases treating brutally, unfortunate caged animals. I once came near engaging in a fight while protecting one of my pets. A ruffian punched his cane through the netting, and catching my Jimmy monkey, squeezed him against a cross-bar. I heard Jim's cries of pain, and as the crowd was so dense I could not reach the fellow, I batted him over the head several times with my umbrella. He turned quickly and said, that if I would come outside, he would "punch in my blooming face," but as my face was something of an heirloom, that dated back several years before my remembrance, and as the fellow's physique and actions convinced me that if I accepted his offer it would be several months before my face would again assume its normal "bloom," I declined with thanks.

Holidays are always dreaded by keepers of zoological gardens, for they frequently result in the death of some animal, caused by being overfed. The night before and on the morning of such days the monkeys are fed a good supply of fruit, that their appetites may be small, and their stomachs in good condition to receive the variety of "junk" that is sure to be given them. The timely arrival of keepers sometimes averts injury to monkeys that have become tangled in pieces of cord given to them by visitors. For these reasons valuable and delicate animals are kept behind glass-fronted cages, or out of public sight entirely.

After a "Bank Holiday" in London, during which 36,000 persons visited the Zoological Gardens in Regents Park, the following articles were taken from three large cages in the monkey house: A bushel of assorted nuts and candies, three pairs of spectacles, two bottles, two spools of thread—which the monkeys had unwound—several tin boxes, nails, marbles, pencils, pennies, and a great many pieces of plain glass and looking glass.

Owego, N. Y.

J. ALDEN LORING.

Grouse Self-Killing.

Editor Forest and Stream:

I was interested in the article under the above headings, in last week's issue of *FOREST AND STREAM*.

I cannot furnish its parallel as to the number of grouse killed on one window, but can cite a case where a grouse has been killed by flying against a plate glass window. While visiting at Theresa a few years ago Mr. Richard Rodenlunt, a hardware merchant, told me a grouse had been killed the day before by flying against the window of his store. I asked him what time of the day it happened, as I had my reasons for knowing. The time given me corresponded with the time I had shot at a grouse that morning in a small piece of woods about a quarter of a mile from his store, and which fled precisely in that direction. I asked Mr. R. where I could see the grouse; he said that it had been eaten. Had I seen it I could have told whether it was the same grouse or not that I had shot at, as I had cut one of the tail feathers out and had it to show, but there is little doubt that it was.

I know of four occurrences near my home in Lockport, where grouse have flown against houses or through windows. The last instance the grouse flew through a window and into the hands of a lady over eighty years of age. The family kept it in a box a few days, then presented it to me. I kept it in a box with wire screen in front of it for six weeks. I then made a brush pile of apple tree limbs in the corner of a hen yard, where I had lost a number of chickens with croup. After clipping one wing of the grouse I turned it loose in the yard. The grouse had done well while confined in the box, and would eat from my hand. But within a week, after turning it loose in the yard, it died, just as the chickens had, with croup.

I have passed six weeks in this cottage this season; the past week with some friends from Lockport. Our larder has contained grouse, woodcock, or gray squir-

rels since the day after our arrival. At present there are one grouse, two woodcock, one squirrel, and a pickerel (lake pike), and we have the very richest milk (Jersey cows), which we procure of a boyhood companion of mine, who is farmer, hunter and trapper, and of whom I will have more to say later.

J. L. DAVISON.

WILDWOOD COTTAGE, Red Lake, Theresa, N. Y., Oct. 28.

P. S.—Apropos of birds flying against windows. About 5 o'clock this morning, while I lay awake waiting for the time (6 o'clock) to get up, a screech owl flew against the window in my room, trying to alight on the middle bar of the screen.

SAYRE, Pa., Oct. 25.—The domestic joys of a Main street, Athens, family were rudely disturbed last Tuesday when a ruffed grouse plunged through the glass of the kitchen window and fell to the floor stunned and quite helpless. Before the members of the household had recovered from their surprise the bewildered bird took wing and made an unceremonious exit.

While driving through Danby, N. Y., last Sunday, I observed a trio of bluebirds plaintively calling from the gnarled surface of a stump fence. The day was raw and moist with flashes of sunshine chasing each other across the brown meadows, and the bluebirds were apparently enjoying these sunny visitations to the utmost.

The season seems far advanced for these beautiful migrants to be lingering in the snow belt of the country.

While on this same ride a mighty army of crows was encountered. The sable marauders swept meadow after meadow until the whole landscape on both sides of the highway literally grew black with the harsh-toned host. With twenty years of life in the country as part of my varied experience, I had never seen so many crows traveling together. They would close down upon a number of fields, throwing out an encircling line of pickets, and thus guarded, feed contentedly for a brief interim, only to rise upon the wind with the precision of an infantry drill at the first indication of anything unusual occurring in the vicinity.

It was a remarkable and altogether interesting array of audacious foragers, and one not often witnessed. Although a notorious bird of theft, the crow has a social quality and an independence that puts him well within the good estimation of most farmers.

While as a boy I used to shoot crows on sight, I now think that the country, with all its delightful inducements, would be a dreary place, indeed, without the presence of these ebony freebooters.

M. CHILL

Buzzard and Baby.

MARIANA, Fla., Oct. 26.—On the afternoon of the 21st inst., two citizens of Lakeland, Fla., while driving just outside of the town limits, saw a most remarkable sight. A woman at work in a field had laid her baby on the ground and stepped a little ways off, when a large turkey buzzard attempted to carry the child off.

When the men saw it the buzzard apparently had entangled its claws in the child's clothing, but could not carry the child off, and was flopping across the field, dragging the child. The frantic mother called for help, and the two men went to the rescue. Just as they reached the bird it released itself from the child's clothing and flew away. The child was unhurt, and was restored to its mother, but it was a narrow escape for the little one.

W. A. M.

[The feet of the turkey buzzard are not adapted for grasping, and they are not known to carry food in the feet. The entanglement of the feet in the clothing must have been accidental.]

October Swallows.

THERESA, N. Y., Oct. 23.—*Editor Forest and Stream:* Early last Monday morning, Oct. 19, while watching for ducks on the overflowed flats on Indian River, I was surprised at the appearance of hundreds of tree-swallows (white-bellied) flying back and forth over the water; they came all about me, I could almost reach them with my gun. I was so interested in the swallows that I fear I missed some good shots at ducks; suffice to say that I did not get a duck, but I got wet while sitting behind a hastily constructed blind in the rain.

J. L. D.

[Our correspondent knows as well any one that the white-bellied swallow is the earliest of the swallows to arrive in spring and the last to leave in the autumn. On Oct. 21 we saw a few hawking about not very far from New York City.]

Game Cookery.

Editor Forest and Stream:

I have had several sportsmen's publications for years and one thing in particular I notice is absent and that is "receipts and way of dressing and cooking game." That's something that many of us, or our wives, don't know much about. I should be pleased to hear from some who know how to do it to their taste.

J. W. B.

In "Hints and Points for Sportsmen" Seneca gives these two recipes for camp cookery:

372. Stewed Game.—Ducks, rabbits, in fact all kinds of game may be stewed. Cut them into small pieces after cleaning, and put into a pot containing enough cold water to a little more than cover them. A minced onion, small pieces of salt pork, vegetables, etc., may be added. Season with salt and pepper, cover the pot and let it simmer until the flesh can be easily pierced with a sharp sliver.

373. Roasting Small Game.—Squirrels, birds, etc., may be roasted on a stick before a fire of piping hot coals. Clean the game, impale it on a stick with a piece of fat pork, and set the stick in the ground before the coals. Turn frequently and baste with the drippings, which should be caught in a cup or large spoon. When a sharp sliver will easily go into the breast they are done. Pigeons, squirrels, hares or rabbits, ducks and grouse should be parboiled before roasting.

Game Bag and Gun.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

A Day's Sport in Alaska in 1893.

A Grizzly Bear Hunt.

Buzz goes the old alarm clock. Three sleepy fellows roll over in their bunks, and Sam calls out in a gruff old voice, "Come now, boy, it's your turn at that sheet iron stove to-day. You just see if you can't beat that record batch of bannocks that I baked yesterday. Fry up a big batch out of the hind quarter of that goat hanging on the first tree out there, for I might not be home to-night."

"If you can't make it to that farthest bear trap to-day and back again you ain't worth the powder that you wasted on that old Billy goat yesterday," interrupted Jim.

I didn't say a word, just rubbed my eyes and rolled out; slid into my heavy wool clothes, shoved several small pitch knots into the little sheet iron stove, piled on a few sticks of dry wood and set it going. We never build big fires when bear hunting, as it has a tendency to drive them away. Bread baking, meat and potatoes frying, and rolled oats and coffee boiling all at once.

"Come on, you husky bucks, out of that! This thing is just about ready to happen. It's time to go grazing here now."

At my command Jim Greenslate, an old Montana scout, soldier, hunter, trapper and miner; and Sam Gowan, a good, old plainsman of the days when Big Nosed George and his gang held almost despotic sway on the head waters of the Yellowstone, rolled out of their springy beds of mountain feathers, "hem-lock boughs," and commenced to prepare their toilet for the swell occasion.

"How's the weather, Cal?" Jim puts in, as he pulls on his moccasins.

"Say, fellows, it's the finest day we've had this fall. If we don't get a bear apiece to-day, besides what we get in the traps and dead-falls, we are really not much good."

Sam peeks out between the flaps of the tent; day is just dawning. "Say, you'll see my pack straps around skins to-night, or you can have my old pelt for a floor mat. There's just enough fresh snow for good track-in', and that left hand of mine has been itchin' all night. You fellows know by this time that that hunch is worth somethin' to me, don't you?"

"How about your lucky dream, Cal? Did you dream of that little girl in California?"

"That's what I did, Jim. You watch my smoke, she is going to bring us good luck to-day." Jim and Sam smiled good-naturedly.

Our camp was by the side of a wild mountain stream that drained a large mountain lake nestled down among the high snow-burdened glacier-ground peaks and mountains that form the water shed of all the streams that run in the great fords and bays of south-eastern Alaska and the streams that run into the rivers of the interior.

We were too far inland to be molested by the coast Siwash Indians, and far enough from the interior, so that we felt safe from being disturbed by the Stick tribes. Game in this protected and favored spot of nature's domain had never heard the crack of the white man's rifle, and had smelled very little smoke of the Indians' old smooth bores.

Many of the largest, wariest and best educated old grizzly, brown and black bear, not to mention the wolves and wolverine, had sought the refuge of this secluded valley as their home; where they might roam undisturbed, as they were intended by nature, and in harmony with their keen instincts. The river supplied them for several months of the year with the finest salmon. The twenty different kinds of berries and fruit that abound, and with plenty of wild cabbage, roots and nutritious grasses kept them in the prime condition. The high ranges of mountains surrounding us were covered with bands of mountain goats and sheep.

Specialists are only content with the best the world affords, therefore these two scarred old veterans of the good old buffalo days had searched out this spot as the best field for big game to their knowledge in all the world. Fate favored me so that I was to share its favors with them.

Breakfast over; guns come off the racks; each fellow puts up his lunch, and carefully inspects his cartridges, six-shooter, hunting knife and belt; we buckle on our pack straps and are off. Sam goes up the north fork of the river in the direction of the glacier, Jim and I up the main river in the direction of the lake. The newly fallen snow cracks and shuffles along as we travel, and we leave a trail behind us that could be seen for a mile. "We'll have some fun crossing our foot log this morning. Hello! what's that? Wolverine, huh, he went along about 11 o'clock last night. Hope he steered clear of our bear traps. He's a big brute and could spring them if he tried."

"Say, we'll fix him some of these days with a No. 4 steel trap," I replied.

"We won't do a thing to him when he gets a little better coat of fur on."

"Whoa! w-h-o-a-p! What's that? Look yonder."

Jim stops and points over on the side of the mountain. A trail about three feet wide in the newly fallen snow and very fresh, wound around and down across the foot of a slide and down on the river bar ahead. We lively up our step and are soon on the spot. "Hello! two of 'em. There's as big a grizzly track as

I ever laid my winkers on. That smallest one is no scrub, is he?"

"Say, if we get them two fellers to-day we'll make Old Sam ashamed of himself."

At this we strike the trail. Not another word is spoken; eyes are scanning every bar, every open nook, every log and tree behind which they have passed. We can see the trail a long distance ahead; we fairly run in that low, bent, sneaking attitude that a hunter always strikes when he is close to game and expects a shot at any second. We come to a big pile of drift wood and logs and can see where they have climbed over; as we near them Jim strikes a match to get the direction of the wind. We have it in our favor. Carefully sneaking up we peek over. "Sh-h-h-h, look out now." Both hands grip the old rifles; our eyes glance over the barrels to see that the sights are clear; we both stand and look upon a mass of bear tracks, bloody and mud-colored snow. They have had their breakfast here, and the remainder of some half a dozen salmon were scattered all about. After looking close we see the trail going on up the river. "They are not half an hour ahead of us. We will get them in those dead falls up there as sure as you're alive. They are headed right for them." Again we strike the trail on a trot. The first great dead fall is in sight. "Say, she's down! We've got one of them sure! What! Well did you ever!"

The dead fall was torn to pieces; great logs scattered in every direction. Over two thousand pounds had fallen on that old grizzly's shoulders, but it had not crushed him. He had backed out, and in doing so had torn the trap to pieces. The bait was gone; with the exception of the loss of a whole lot of long, silky, silver tipped hair, the old fellow seemed none the worse for his experience, and had continued on his journey up the river with his smaller partner and right in the direction of the next bait, where we had set a great 42-pound No. 6 Newhouse steel trap, supposed to catch and hold any game animal on the American continent. We again hit the trail, and as we near the trap, a roar mingled with the crashing and cracking of bushes and trees greets us. "Helloa, old boy, we got one of you! Where's your old partner?"

The big brute had cleared off nearly a quarter of an acre of brush and small trees, and had dragged the big trap and log attached, weighing fully 400 pounds, over everything he had come to until it fouled under and against two trees. He sees us coming and charges full tilt, comes as far as the trap and chain will let him, then rises on his haunches and strikes the trap against the log with force sufficient to pulverize it. Two six-shooters speak at once: he lunges forward and falls in a great heap with a shattered brain.

"That's No. 1—now for the big one. That big one has smelled iron before, and he's going to give an account of himself."

"He's not far from here, right now."

We carefully inspect our shooting irons; and again hit his trail up the river. He goes around a steep bank on the right, then up through a big, open park and into a bunch of timber. "There's where he's lying, Cal. You go up that right-hand ridge and head him off. I'll follow him. Keep in sight so we can both do some shooting."

I climbed the first ridge and was sneaking along keeping Jim in sight. From my elevated position on the ridge I could see the bear's trail lead up to the top of a little mound and stop behind an overhanging ledge of rocks. Jim was within forty feet of it when I whistled.

Jim stops to wipe the snow from his gun barrel, and at the same time the great silvery-coated old monster hears him coming and rises from his bed and prepares himself for the attack. I dare not shoot, as they are almost in a direct line from me. The old grizzly's mane raises and turns the wrong way. His small, brown eyes flash and sparkle like two great, black diamonds. His lower jaw drops, his long, upper lip lowers and projects forward, forming almost a proboscis. Foam and strings of saliva run from his long, pearly pointed fangs. His round ears lower and lie down out of sight in his furry headgear. It has taken about six pulsations of his ponderous heart to make this transformation. He is ready.

Jim coolly raises his old .45-70 Winchester. I can see the polished ivory bead, I can see the glow of silver run along the barrel as the sun reflects its rays on it. I can hear the lock go click, click. I can see that right elbow out on a level with his shoulder, the hand on the lever ready for quick action and that forefinger dangerously pressing the trigger. It has taken about three seconds to do all this. Jim is ready. Then a roar from the grizzly mingles with the report of the rifle and fairly shakes the snow from the branches over head. The bear charges; two shots at almost the same second take effect. I cannot keep out of it any longer. They seem to be almost together now, and a rifle shot rings out; the snow flies in all directions, as the grizzly rises to make his last and fatal lunge. Jim gives it to him fairly in the sticking place. A great gush of crimson shoots forth as he falls within ten feet of where Jim stood. The great grizzly bleeds all the more freely from his over exertion; and as I appear on the scene several seconds later, all is quiet. Jim stands over the great bear seeking out where the shots took effect. A blue cloud of sulphurous smelling powder smoke ascends heavenward, and the last faint distant echo of our heavy guns answers as the death dirge of this old veteran that had lately crossed another great divide to a happier mountain valley home where enemies are unknown.

"What a beautiful trophy, Jim. You won't ever part with that, will you? Keep it, and when you go back to your good old home in Illinois present it to your old mother."

Ah, Cal, it has been a long time since I have heard from her, she might be dead now."

"Oh, well, you might have a sweetheart or your sister will keep it for you until we make our stake mining and you have a lovely home of your own."

"Yes, I have a sister, a dear sister, too." At this he stopped, I knew him too well to proceed further. I

had heard him relate a sad, sad love tale with his life's devotion attached that ended badly.

A saucy bluejay jumped from twig to twig over head and chirped as we sat down on the great grizzly and ate our lunch. "What will we call him, Jim?"

"Why, we'll call him the Czar, and you must take that beautiful robe to that little love of yours. She brought him to us and she must have it."

"Say, it was funny, wasn't it, Jim?" Let's go up and see where he was lying when we came on to him. Well, don't that beat the snakes! There's as fine a ledge of copper ore as I ever seen. It's pretty low grade, but I only wish I had it down in the States."

After robbing the old grizzly of his robe I wrote the following verse on a tree near by:

Come, wolverines, you gluttons of the wood,
Satisfy your cravings with something good.
And you, fleet pine martin of the tree,
A feast is here widespread to thee.
You howling packs of black and gray timber wolves now prepare
Your pearly fangs so that you'll get your share.
And Mr. Fox, although you're scarce and few,
Sneak in and steal your scant just due.
The owls of night, the ravens, crows, jays, and hawks of day
Are all invited; you must not stay away.
Eat and be merry, is our toast to you all;
We've had our fun; we caused the Czar's downfall.

But all bearkind are warned to stay away,
Around this grizzly's bones you must not stray.
Although you are hungry, dine not one on another;
It is bad taste, and this might be your brother.
You wise and solemn prickly porcupine,
Stand and look on, for here you do not shine.
And Mr. Red Squirrel, although you're very fleet,
Take my advice and beat a safe retreat.
The snowy ptarmigan of high, and ruffed grouse of the wood,
Sit on high limbs, look pleasant, and be good.
Venture not too near this bloody battleground
While all your dreaded enemies are around.

CAL & JIM,
Nov. 2, 1893.

Some day I am going back to get some more samples of the ledge. I would have gone before this, but the little girl proved untrue. I was robbed of the pleasure of making her happy with the Czar's robe, and am afraid the mine would be an unlucky one.

SNOWSHOE.

Maryland Association.

From the Baltimore Sun, Oct. 4.

NEVER before in the history of the Maryland State Game and Fish Protective Association has its annual meeting been so satisfactory as that which was held last night at the Eutaw House. Many of its members have passed the age when they shoot or fish much, but they still work to perpetuate the supply, which will give sport to future generations.

President J. Olney Norris presided and sixty or more members attended. Among the guests was Dr. T. S. Palmer, of the United States Biological Survey. He was asked to make an address, and based it largely upon the suggestions in the reports of the association's officers.

Regarding suggestions against the use of pump (magazine) shotguns, he said they were legislated against in California, but the Court of Appeals had decided the law unconstitutional. The case was not carried to the Supreme Court of the United States. Dr. Palmer said he believed it to be as good law to prohibit the use of pump guns as the Maryland law prohibiting the use of swivel guns in duck shooting. He rather favored the limiting of the amount of game each hunter should bag in a day or season, but told of the troubles in determining this when sportsmen were greedy. Limited bags cut out "hog killing" records.

He strongly advocated the passage of uniform game laws in this State and said that Maryland, Virginia, Tennessee and North Carolina had had the worst game laws of any States in the Union. Tennessee and Virginia have during the past year made uniform State laws, and he was anxious to see Maryland follow suit.

Touching wild duck shooting, he said the upper Chesapeake was one of the three greatest points in this country, Currichick Sound and Long Island being the other two. He strongly advocated the shortening of spring duck shooting. For woodcock, the handsomest and now one of the scarcest of game birds, he advocated a closed season in the State for not less than three years. For the wood ducks he advocated a like closed season. The stopping of the sale and shipment of these birds he believed would have the proper effect. Information was abundant to his department that ducks were being netted.

When asked to go further with advice, Dr. Palmer turned the request into a neat compliment to the association. He said: "This Maryland Association was the pioneer in enforcing the national laws relating to the destruction of birds for plumage. About three years ago this association caused an arrest and conviction of a dealer in gulls' wings. The constitutionality of the law was tested, and to-day the dealing in this commodity is in the hands of a trust, which is working in harmony with the Audubon societies, and the laws are not being violated to any great extent."

A vote of thanks was given Dr. Palmer.

Mr. C. C. Coffin, of Prince George's county, proposed to have every resident owner of a gun used for field or water shooting taxed \$1 and \$10 for every non-resident, the tax to go to the fund for the protection of game.

Secretary Oregon Milton Dennis announced that his report was more in the nature of suggestions than a report on what had taken place. He said there were fewer complaints in the year of violation of the laws, except as to purse-netters in and about Havre de Grace and the upper bay. His paper continued in part as follows:

"The association, through the game wardens and its officials, have had several cases affecting the game laws, and some convictions, notably the fining of a young

taxidermist, who was convicted of destroying the nests of song birds in Baltimore county for the collection of their eggs, as well as killing the birds that he might become more proficient in his amateurish fad.

"The matter which has claimed attention almost exclusively during the summer months is that of securing one of the boats of the State navy to enforce the law against purse-netters.

"The deputy game wardens had little difficulty in reaching the violators of the game laws, but it was impossible for them to reach the fishing boats. Reasonable men; therefore, can see that the only aid they could get would be that supplied by the State. A memorial signed by about 500 prominent business men and large land owners was presented to the Board of Public Works. The Governor practically put it up to the commandant of the oyster navy to grant the boat asked for. The secretary had failed to come up with the commandant, hence no boat.

"I quote from some of the correspondence I received as to the damage resulting from non-protection: 'How about that boat that was to come to Poole's Island to look after purse-netters? I have been down several times within the last two weeks and always found four or five of them there.' This is from a letter of July 2. 'Have you ever tried to inform yourselves as to the purse-net fishing on the flats above Poole's Island? It is the worst this year that it has been for years, and, I am told, not contented with scraping the spawning grounds of the rock and white perch, that there are a few of them that are dynamiting the wrecks that they cannot purse over. * * * A visit most any day will find from 4 to 10 of these scrapers at work on the upper flats. As they have canvas nailed over their names, it is impossible to tell who they are.'

"Now, as to the violation of the game laws. Outside of the killing of ducks on their feeding grounds in Harford county last winter, I have had very few complaints.

"At the last meeting of the executive committee of the association, held in September, 1903, two committees were appointed—one to recommend amendments and new laws to the coming session of the Legislature on game and the other for fish. The secretary would be very glad to receive suggestions and propositions.

"It is the purpose of the association to again present to the Legislature the bills known as the Purse-net Bill and the Salt Water Bill, and they have reason to believe that the opposition to these bills exhibited at the last session of the Legislature will be absent at the coming one.

"The State Game Warden Bill should also be amended, or, more properly, reconstructed. Reports have come to the secretary that some of the most frequent violators of the laws protecting game and fish were deputy game wardens themselves.

"Some means should be taken by this association to prevent the cruel slaughter of pigeons as targets by the shooting associations of this city. Marksmanship can as well be demonstrated by clay pigeons.

"Now, as to recommendations:

"1. Game laws of the State, as codified, are in a chaotic condition, and your secretary recommends the presenting of a bill to the Legislature providing for a competent board to codify and issue the laws under their supervision.

"2. An entire revision of the State Game Warden law to meet the demands and give more authority to and better equip the deputy game wardens for the purposes of their duties, and particularly to give them power to arrest without first securing a magistrate for the issuance of a warrant, thus allowing the violator to get out of the jurisdiction or the presence of the deputy game warden before such warrant can be issued.

"3. Some means should be taken, through an act of the Legislature, providing for the setting aside of at least one boat of the State Fishery force in the waters of the Chesapeake Bay and its tributaries, to prevent violation of the fish laws.

"4. A bill should be prepared and presented to the Legislature to prevent the use of pump or magazine guns in the State for the killing of birds and game.

"5. A general revision of the game laws of the various counties, looking to the prohibition of shooting partridges in such counties where these birds are becoming almost extinct.

"6. That the association employ a detective for at least one month prior to the opening of the season for gunning and one month after its close, for the purpose of catching up with the handling of game out of season.

"7. Making it unlawful to shoot live pigeons, etc.

"8. Some action should be taken, as I recommended in my last report, to see that the ducking police on the flats properly perform their duties and see that the non-resident gunners be caught up with. As I reported at the last annual meeting, they get into Maryland in this way: A non-resident, who usually belongs to the wealthier class, comes to Maryland with his steam launch or other contrivance, gets a resident to take out in the resident's name, a license, and then employs the resident to go gunning with him, making the dishonest resident his substitute in violating the law. This should be stopped, and a proper bill should be presented to the Legislature for this purpose.

"9. While it is true that the association is doing more effective work than ever before in its history, it could be more effective if it had more funds with which to pursue its work. As the treasury is made up only of dues, it became us to secure many new members.

"10. As the game laws of the State are not uniform, by reason of the different local laws of the counties, the secretary recommends that every effort be made at the coming session of the Legislature to secure uniform laws throughout the State."

Secretary Dennis' report was discussed a bit. While it was not stated plainly, it was easily observed that there was some objection to the proposal to secure legislation against the pump gun; also the shooting of pigeons from traps.

The pigeon question was argued by Mr. George Dobbin Penniman, who thought the association should

not put itself on record as opposed to trap shooting. It was a question belonging more particularly to the Society for the Prevention of Cruelty to Animals, and as that society had found it impracticable to get a law passed by the last Legislature, he was of the opinion that the Game Association would have quite as much as it could attend to regarding matters which belonged strictly to it.

Dr. B. Holly Smith proposed that the secretary's report be referred to the law committee. Secretary Dennis explained that he had embodied the recommendations in his report at the solicitation of members and did not intend to make them laws, but simply submit them for what they were worth. The report was accepted and referred to the law committee.

W. R. Armstrong, secretary of the Maryland and District of Columbia Field Trials Association, stated the trials would be held at Chesapeake City, Calvert county, in November. This association has 2,000 acres of land there, which is guarded day and night and cannot be shot over before the field trials are concluded.

The following officers were elected for the ensuing year:

President, J. Olney Norris; Vice-President, Marion H. Ould; Treasurer, Henry Brauns; Secretary, Oregon Milton Dennis; Attorney, Richard F. Kimball. Executive Committee, George D. Penniman, Marion H. Ould, William B. Hurst, A. E. Thompson, L. M. Levering, W. H. Fisher, R. F. Kimball, Dr. S. C. Pennington, Dr. Charles C. Harris, Robert J. Kane, Henry Brauns, J. Olney Norris, Robert H. Gilbert, William H. McDowell, Dr. H. G. Wilson, Conway W. Sams, R. Berry Bull, Oregon Milton Dennis, W. T. Howard, M. S. Baer, Dr. B. Holly Smith, Dr. A. P. Gore, C. S. Schermerhorn, DeCoursey, W. Thom and W. H. Armstrong.

All were re-elections except that Mr. Hurst was added.

Maine Big-Game Grounds.

BANGOR, Maine, Oct. 31.—*Editor Forest and Stream:* The "rush" of sportsmen into the Maine woods continues to be noticeable by its absence, although they may yet come along in goodly numbers, there being still a full month of the best hunting time left before the season on moose ends. While the hunters are at liberty by the laws to bring in a couple of deer until the middle of December, the latest hunting is usually largely done by the residents, and comparatively few non-residents remain in the State after all possible chance of getting a moose is past. Thus, so far as the out-of-the-State hunter is concerned, Maine game is receiving better protection than it has known for many years, and will unquestionably increase materially if let alone by the residents.

Wardens are actively on the watch for violators, that it may be made as expensive for them as possible, but the very construction of the law robs these emissaries of the law of their terrors. One recently expressed his opinion quite forcibly when he observed that he had found the leak in the new license law, as every man he met in the woods with a rifle and asked for his license, replied that he was "hunting birds," which, under the law, he is at perfect liberty to do, without a license attached, and in case he sees no deer to kill, he avoids the application of the famous Bertillon system of identification, so brightly illustrated by last week's issue of *FOREST AND STREAM*. If, on the other hand, he shoots a deer, he hangs it up, spots a trail to the road, slips out to the railroad station and buys a license, and later takes home his game. He thus avoids what so many men dislike cordially to do—the paying for a possibility.

The license law is, too, responsible for a far greater slaughter of does and small deer, in proportion to the number of hunters in the woods, than in former years. The purchaser of a license, in nine out of ten cases, wants at least part of what he has paid for, and failing to get the desired buck, knocks over at the eleventh hour anything in the deer line that will give him his limit. Unsportsmanlike, do you say? Yes, but—

To-night marks the close of the first thirty-one days of big-game hunting, and each day sees its quota of moose and deer passing over the railroads on its way to some happy hunter's home, or to the taxidermist's for mounting. Judging by the remarks heard, the new law grants freer exit for the non-resident, as he is practically unknown in connection with the handsome trophies that may, perhaps, travel on the same train with him, and he who dislikes to run the gauntlet of agents for taxidermists at the Bangor station has the fun of seeing the resident importuned for the privilege of making "more beautiful than in life" the trophy that has cost time, money, and work. On the other hand, a great many of the pieces of game go out ahead of the owners, and thus there is no "cutting off the head while you wait," and the taxidermists are undoubtedly seeing that what is the sportsman's gain is their distinct loss. With all their hustling—and they are all hustlers, too—a vast proportion of business that once meant hundreds of dollars left in Maine by the visitors, is sliding right by and into the hands of taxidermists who live in other States, and Maine is the poorer by so much less cash in circulation.

The number of pieces of game passing through the city has shrunk appreciably this week, but while the opponents of the license law may lay the decrease to the effect of that law, there is abundant opportunity to blame natural causes for the shrinkage. The extremely dry fall has made rivers look like small streams, and never did the upper waters of the Penobscot appear so low as they have during the month now passing away, while other rivers have, of course, been similarly affected. Sportsmen who have in previous years canoed from Atkins' and Arbo & Libbey's camps in the far moose country through to Ox Bow, have this season walked all of the way, both going and coming, and the recent fall of eight to twelve inches of snow on a soft bottom has not made the tramp any easier, either. In those sections where little or no snow fell, the leaves continue dry and brittle, and it is almost impossible to still-hunt the game, one's best method being to sit still and let the deer do the hunting.

Few parties who come into the State will be able to report better success than the party of seven who came out Monday from the Nesowadnehunk Stream country,

four of the seven having moose to their credit. In the party were Harry A. Van Gilder, D. P. McClellan, Frederick Muchmore and D. F. Sturgis, of Morristown, N. J.; Elmer Dickerson, of Mt. Tabor, N. J.; G. V. Muchmore, of Summit, and E. F. Duffy, of Newark. The successful moose hunters were Messrs. McClellan, Sturgis, G. V. Muchmore, and Duffy, and all had what deer they wanted.

Wm. Destdar, a member of a Brooklyn, N. Y., party which went into a camp on the Mooseleuk, a tributary of the Aroostook, had the best luck of his party, getting a moose with a small spread and six points. It was the first moose he ever saw alive and in the woods, and he just let him have it, with fatal results for the moose.

One of the most delighted resident sportsmen to return home lately has been Dr. C. P. Thomas, of Brewer, who went into the woods far above Moosehead Lake to vaccinate the woodsmen in a series of lumber camps, on account of a possible epidemic of smallpox, which raged in the Maine lumber regions last winter, and has appeared in some sections with the first frosts. After his official visit was ended, the Doctor set out for a day's hunt, and in an hour and a half from leaving camp had shot five out of a flock of partridges that were in the road, almost within sight of camp, and killed and dressed two handsome bucks, one a spotted white buck with very beautiful markings, and a very striking set of antlers.

Dwight Foster, of Beverly, Mass., made the first trip of his life after big game to Patten, taking home as the first buck he ever shot at in the woods a fine 200-pounder with ten-point antlers.

Probably the biggest buck to be brought out this season, and, with one exception, the largest reported killed so far in the woods in 1903, was shot by C. F. Perkins, of Brewer, in the ridges west of St. Croix Lake. It shipped 300 pounds, and probably weighed, when alive, a good forty pounds more.

Another of the successful parties was made up of three Rhode Island men, Dr. N. R. Hall and C. P. Driscoll, of Warren, and Dr. N. D. Harvey, of Providence, who decided to visit the territory around Third Lake of the East Branch Penobscot, where they have enjoyed great sport in the past. Their success proved their wisdom, for they added two moose and the legal number of deer to their records; Dr. Harvey's and Dr. Hall's trophies differing four inches in spread, while each had 16 points. The horns measured 42 and 46 inches. Mr. Driscoll was modest in his wants, and preferred hunting birds near camp to big-game shooting, so that he kept the table well supplied with partridges, and incidentally knocked over a very fine fox for variety.

Quite a party of Cleveland, O., hunters was here for a stay, being several members of the Forest City Hunting Club of that city, which has sent detachments of more or less members each fall for several years.

Harvey Farrington, of New York, had excellent success at Reed Pond, going in and returning via Ox Bow, and shooting a moose with 13 points to its antlers. He also secured two very nice bucks.

J. W. Darcey and wife, of Lynn, Mass., after a stay of a month at Nahmakanta Lake, reached by way of Norcross, a trip up the lower lakes and a seven-mile carry, have returned home with the happy consciousness of having killed the biggest game Maine affords—a moose. It was not a big head but a very shapely one, with antlers having 13 points. Whether the number was unlucky or not is according to the point of view—it was for the moose.

Another moose reported came from far to the north, where a party of Greenville, R. I., sportsmen camped on St. Froid Lake, or, as the residents commonly call it, "Joe Neddo Lake." In the party were M. W. Mowry, J. H. Bowen, J. S. Remington and O. A. Tobey, and Mr. Bowen was the lucky moose hunter.

Henry Adams and Henry Adams, Jr., of Springfield, Mass., are out after a delightful trip down the West Branch of the Penobscot. They had fine weather most of the time, and saw quantities of game, including six moose, 119 deer, a bear and three foxes. As the moose were none of them of legal age or sex, the party confined itself to deer, and Mr. Adams, the younger, shot two very fine bucks, one having 13 points to its horns.

G. H. and C. W. Freedley, of Philadelphia, are out from Spider Lake, with reports of a great outing of three weeks, and the first-named had as his share of the fun memories of the time when he faced a big bull, and shot him, too, with his .45-90 carbine. The antlers were among the best brought out this year, spreading 52 inches and bearing 23 points.

J. H. Baker, of New York, was delighted with his trip to Maine, and he ought to be, since he secured his moose the first day of his hunting in the Nesowadnehunk country. In ten days he saw four bulls, but none with larger antlers than the one he had shot on his first hunt.

C. P. Keeler, of Attleboro, Mass., was all smiles when he reported that he had all that was coming to him in the way of game, and proved it by his record of a moose, two deer and a bear, not to mention all the partridges he could dispose of at the camp table. He might, indeed, have shot many more birds but for the desire to make as little noise in the moose country as possible, and shoot only for immediate needs.

The ladies, too, have been somewhat in evidence during the week, for all the outgoing parties haven't been exactly "gander parties," although from the stories some tell their guides may have thought them geese at the critical moment. In one party was two ladies from Wareham, Mass., who supplied the camp with birds all through their stay, while the men of the party were after big game. They were Misses Alice Tobey and Maud Palmer, and proved themselves skillful with the shotgun, while Messrs. Geo. W. Weymouth and Horace P. Tobey did the deer hunting with excellent results. Mrs. Frank L. Shaw, of Portland, although wife of the owner of the extensive Morris Farm on Chesuncook Lake, rechristened Camp Greenwood, never killed a deer until the other day, when she stood on the piazza in the morning and shot a magnificent buck which stood 175 yards distant.

Sentiment in Washington.

MYERS FALLS, Wash., Oct. 20.—*Editor Forest and Stream:* I reported to you a few days ago the action of the Superior Court of Spokane county, Washington, declaring the late amendment to our game law unconstitutional. I find since, some correspondence in local papers criticising the enactment of any laws restraining the killing of game at any time, or by any body. Indeed, I have talked with more than one man who earnestly contended for the same kind of slaughter, of the beautiful and palatable denizens of the field, forest and stream.

These expressions of opinion do not indicate a cultivated or refined condition of mind, among no insignificant class of citizens. And yet the individuals with whom I talked, had the appearance of being gentlemen. They were well dressed, were well behaved, were not coarse in social intercourse, and attended to business in a successful way. From such conditions one can scarcely fail to conclude that there is room for a great deal of missionary work among even the respectable classes. I believe if they knew what they meant, they only wished to say that if a man is hungry, and had no other way to gratify his wants, he should be allowed to kill game at any time or place to appease his appetite. The game laws of British Columbia permit the prospectors to kill game in cases of this kind. But no decent prospector has ever dynamited fish, nor ruthlessly destroyed a fish hatchery; but the first of these social crimes was perpetrated even as late as last spring, in one of the lakes of the State of Washington, and the second was committed to the Margaree River within a time not beyond the memory of man.

The primitive savages, lo, the poor Indian, before he came in contact with his white brother, was never guilty of such shameless destruction. It remained for the pale face and the so-called superior white man to descend to such deviltry as I have recalled.

A. HECTORSON.

Hard Lines for Italy.

Editor Forest and Stream:

Among all the poachers and hunters out of season, the Italians and Poles are the worst. They will shoot anything that runs or flies. They are about the only ones who will ever shoot a robin, but they will, if let do it.

Three of them came to grief at Windber, a small mining town in Pennsylvania, last week. They shot one robin and had it with them when they met the game warden. It only cost them \$95; the justice fined them for (1) hunting out of season, (2) hunting without a license (they were not naturalized and have to pay a license in this State), (3) killing song birds, and (4) shooting within the borough limits. They paid, they seem always to have the money to pay, too.

Three years ago this summer I caught two Italians setting a net in the harbor here. They took the alarm when they saw me watching them, and dropping the net, made off, going across to the Peninsula. Going back to the city I called up the chief of police by telephone and had him send an officer down to me; then we went out to where I had marked down their net and dragged it up with a boat hook; and next, going across, got their boat; then hunted up the men, who were hiding back in the timber. The justice gave them \$25 and costs each; and one of them, who did not look as if he had ten cents about him, going down into his pocket, brought out a roll of over \$100 and paid both of the fines, then wanted his boat and net. We let him have the boat again, though he need not have been given it, but the net had to be destroyed.

CABIA BLANCO.

North Carolina Licenses.

GREENSBORO, N. C.—*Editor Forest and Stream:* The new game law in North Carolina passed by the last Legislature is now in force. The Audubon Society of North Carolina is responsible for the appointment of game wardens. Up to October 15 sixteen wardens have been appointed and twenty convictions have been secured in the State for the violation of the bird and game laws. The Society is working hard to break up the pot-hunters and the shipper, and earnestly solicits the interest and co-operation of all true sportsmen who come to North Carolina to hunt.

A license of \$10.25 is now required of all non-resident hunters who come to the State. The license may be secured by filling an application blank and mailing the same to any county clerk in the State, together with \$10.25; or it may be obtained through the secretary of the Audubon Society, Greensboro, N. C.

The money collected from licenses is used to enforce the game laws. This sum is supplemented with over \$1,400 subscribed by members of the Audubon Society to help enforce the game laws. The secretary will gladly furnish application blanks and correspond with anyone who may wish further information.

T. GILBERT PEARSON, Secretary.

In the Mississippi Delta.

SARDIS, Miss., Oct. 24.—*Editor Forest and Stream:* It seems that the hunting season has opened quite early here, judging from the fact that parties from a distance have begun coming to try a few days with gun and dog in the bottom. Last week a party of ministers from the northeastern part of the State, and a party from Memphis, came here and fitted out for a hunt in the great delta. We have not heard yet what success, if any, they met with. We believe it is the first instance we ever knew of where seven preachers met to go on a hunt for anything except sin and the devil. We hope they will find nothing of the sort down here, but will be successful in finding and bagging a fine lot of game of the kind they are after, be that what it may.

We have heard of several individuals going quail or partridge hunting, but think they are almost too early, as the young birds are not large enough; and besides, if a man cares for his dog, he will not go into the

fields yet, as the weeds and grass still hold their seeds, and the dogs get them in their eyes and ears and cause them great pain and suffering.

Mr. W. T. Dye, of this place, went out this morning and returned about 4 P. M. with a fine three-prong buck.

It is quite convenient now for a person to go down, right into the very heart of good deer hunting on the Sardis and Delta Railroad, spend the day hunting and return the same evening. This is a private railroad and only runs from Sardis down into the bottom, where the proprietor owns large tracts of fine timbered land. At a distance of from twenty to twenty-five miles, the sportsman gets to where he has no trouble finding game quite plentiful.

DENNIS.

The Vanishing Grouse.

DUNBARTON, N. H., Oct. 27.—For something over thirty years I have hunted a great deal each season through the covers in this section. Never were birds so scarce here as this year. There has been a most decided slump since last year. When the season of 1902 closed there were a good many birds. I could then start ten or fifteen where it is now hard to find one or two. Last winter was not so severe; and even had the birds failed to breed last spring, there should be a fair number now. The covers here are about as near empty as they can be. I have killed five grouse, and a neighbor about the same. Every bird I have examined was in fine condition, no signs of wood-ticks or any disease. It costs very little for ammunition this year. I have nearly worn out some twenty cartridges carrying them about in the pockets of my shooting coat. It looks to me as though there were not near birds enough about here for a breeding stock.

With the going of our ruffed grouse, so will our bird shooting. Migratory quail and imported pheasants have been tried and seem total failures.

We had better do one of two things, make it a close season for some years on all feathered game, or make it an open season at all times. The first would mean no shooting, the latter nothing to shoot.

C. M. STARK.

The Story of a 'Coon Hunt

DUNBARTON, N. H., Oct. 27.—The season here on 'coons opens on Sept. 15. The following is the story as I was told:

On the night of Sept. 14 two parties went after 'coons. Usually in the early part of the 'coon season when the leaves are on, it is hard to find a 'coon after it has been treed. Oftentimes it means waiting at the tree until daylight. Party number one started a 'coon in the early part of the night. The dog, after a time, lost the trail. Later the dog of party number two found the trail and treed the 'coon. The owners followed up and shot the 'coon. Just then party number one appeared and claimed the 'coon. It was then 11:45 P. M., just 15 minutes before the open season. The party having the 'coon refused to give it up. There was some loud talking, and the next day party number two complained to the game wardens of the other party as killing a 'coon out of season. The party complained of paid the fine, and some rather unfriendly feelings are the result.

C. M. STARK.

Wildfowling a la Mode.

GREENWICH, Conn., Nov. 1.—Frank Voss, of 180 Berkeley Place, Brooklyn, was arrested by Sheriff Ritch last night on the Sound Beach estate of J. Kennedy Tod, the New York Banker, for killing two Australian swans, which he found on Mr. Tod's private lake at the end of Old Greenwich Point. Mr. Tod's estate adjoins the Innes Arden Golf Club, and Voss asserts that when he and Roy Hall went there last evening and said they were going ducking, some one said he could find all sorts of ducks on Mr. Tod's pond. He had been drinking a little, he admitted. He waded out into the pond and shot at some floating objects in the twilight. They turned out to be the Australian swans. His aim was deadly. Mr. Tod's watchmen, who were on the lookout for some one who had previously killed some ducks, surrounded Voss and guns were pointed at him. He surrendered and the watchmen locked him up in the attic of Mr. Tod's mansion and telephoned for an officer. Sheriff Ritch took pity on the shivering man, and at Frank Palmer's stables had him wrapped in blankets.—New York Times, Nov. 1.

A Phenomenal Bag of Canvasback.

ROCHESTER, N. Y., Oct. 31.—*Editor Forest and Stream:* It is so seldom of late that one can tell of a good day's shooting in old Monroe county that I have uncommon pleasure in relating the facts of a rare case that took place here on October 28. John Norton, of the Rochester Rod and Gun Club, and Philip Seibold were duck shooting at Braddock's Bay, once a famous ground, but of late years altogether over shot. A flock of fifteen canvasbacks came to the decoys and eleven of them were promptly brought to bag. Although Braddock's Bay was once as good a ducking resort as any in the State, it never was famous for canvasbacks; and this day's shooting is regarded as the record for Monroe county on these particular birds. A trolley line runs to the bay and it is visited daily by scores of shooters, so that the presence of so many of the famous birds is an event of decided interest to wild-fowlers. The duck shooting on our bays has been somewhat better than usual this year.

E. R.

The Minnesota Deer Skins Case.

IN January, 1902, Executive Agent Sam F. Fullerton confiscated a parcel of deer and moose hides in possession of Dell Linden, a tanner in Itasca county, Minn. Linden sued to recover the value of the skins and won the case, the jury awarding \$325. Agent Fullerton appealed the case, and the Supreme Court has confirmed the decision, holding that "A person who, in good faith, has purchased deer and moose skins for the purpose of tanning the same, acquires a valid title thereto; and in an action to recover the hides, or their value, from the game warden who took possession thereof, the owner is not required to prove that the animals from which such skins were taken were lawfully killed."

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Hearing and Allied Senses in Fishes.

BY G. H. PARKER, ASSISTANT PROFESSOR OF ZOOLOGY, HARVARD UNIVERSITY.

(Contributions from the Biological Laboratory of the U. S. Fish Commission, Woods Hole, Massachusetts.)

It is a well-known fact that many fishes are extremely sensitive to disturbances in the water such as are caused by splashing with an oar, stamping in a boat, or striking the side of an aquarium. When, for instance, the opaque wall of a fish tank containing young kingfish, sea robins, or killifish is struck a vigorous blow with the fist, the fishes usually respond by giving a short, quick leap, and, if such blows are frequently repeated, surface fishes are often driven to the bottom and kept there. Notwithstanding the sensitiveness indicated by such reactions, most of these fishes appear to be unaffected by loud talking or other like noises originating in the air. Fishermen are familiar with these peculiarities and often take them into account in the practice of their art.

Such facts as these are also usually accepted as evidence that fishes can hear (as an example, compare the statements made by W. C. Harris in Dean Sage's "Salmon and Trout"), but a simple experiment will show, I believe, that this assumption is not necessarily correct. If one end of a wooden rod is vigorously tapped while the other is beneath the level of the water a disturbance is produced that will call forth an obvious response from most fishes of moderate sensitiveness. Such a disturbance will likewise affect a human being, for if one holds the head beneath the water the vibrations from the rod can be easily heard, and if the hand be placed in the water near the rod they can be distinctly felt.

Since, as Müller long ago pointed out, we can feel as well as hear these vibrations, it follows that such evidence as that already given can not be accepted as conclusive proof that fishes hear, for it is conceivable that their responses may be entirely through their sense of touch, i. e., independent on their skins. Moreover, fishes possess a special system of tegmentary sense organs, the lateral-line organs, which are completely absent from us, and it may be that these are in some way the recipient organs for the disturbances already described. When, therefore, a fish responds to water vibrations of the kind mentioned, we are not justified in concluding that it hears, for it may respond through the skin or the lateral-line organs and not through the ears.

It may be reasonably asked at this point, What constitutes hearing? Everyone will agree, I believe, that the sensation we get through the skin from a vibrating rod in water should not be called hearing, and what is true for us should hold for the lower vertebrates. Hearing in these animals may therefore be defined as that sensory activity resulting from a stimulation of the ear by material vibrations. This is in essential accord with the definition given by Kreidl to the effect that hearing is that sensation which is mediated by the nerve that is homologous with the auditory nerve of man. When, therefore, a fish responds to sound vibrations the question at once arises whether the stimulus is received by the skin, the lateral-line organs, or the ear. And until this question can be answered, at least so far as the ear is concerned, the query whether fishes hear or not must remain open. In dealing with this general subject I shall take up, first of all, the question whether fishes respond to sound vibrations through the ears.

The Ears.

Introductory.—The internal ears of fishes were described as early as 1610 by Casserius, and were studied in some detail in the following century by Geoffroy, Scarpa, Comparetti, and Hunter. The attitude taken by many of these early workers on the question of the ability of fishes to hear or not is well illustrated by a quotation from Hunter, who, at the conclusion of his paper on the organs of hearing in fishes, made the following statement:

"As it is evident that fish possess the organ of hearing, it becomes unnecessary to make or relate any experiment made with live fish which only tends to prove this fact; but I will mention one experiment to show that sound affects them much and is one of their guards, as it is in other animals. In the year 1762, when I was in Portugal, I observed in a nobleman's garden, near Lisbon, a small fish-pond full of different kinds of fish. Its bottom was level with the ground and was made by forming a bank all round. There was a shrubbery close to it. Whilst I was lying on the bank, observing the fish swimming about, I desired a gentleman, who was with me, to take a loaded gun and go behind the shrubs and fire it. The reason for going behind the shrubs was that there might not be the least reflection of light. The instant the report was made the fish appeared to be all of one mind, for they vanished instantaneously into the mud at the bottom, raising, as it were, a cloud of mud. In about five minutes after they began to appear, till the whole came forth again."

This passage shows very clearly that in the opinion of Hunter the internal ears of fishes, like those of the higher vertebrates, are organs of hearing. Without further experimental evidence this view was accepted by Müller in his well-known chapters on the physiology of the senses, and by many other eminent authorities, such as Owen, Günther, and Romanes. To these investigators the presence of the internal ears seemed, as it did to Hunter, sufficient ground for concluding that these animals could hear.

Within recent years, however, this opinion has been called in question, or even denied. Some of the grounds for this change of view may be stated as follows: Bate-

son, in some investigations on the sense organs and perception of fishes, observed that the report from the blasting of rocks caused congers to draw back a few inches, flat fishes (like the sole, plaice, and turbot) to bury themselves, and pouting to scatter momentarily in all directions; other fishes seemed to take no notice of the report. When the side of a tank containing pollock or soles was struck with a heavy stick, the fishes behaved as they did toward the report of the blasting. Pollock did not respond, however, to the sound made by rubbing a wet finger on the glass window of an aquarium or to the noise made by striking a piece of glass under water with a stone, provided the means of producing the noise was not seen by the fishes. Bateson concluded that, while it may be regarded as clear that fishes perceive the sound of sudden shocks and concussions when these are severe, they do not seem to hear the sounds of bodies moving in the water but not seen by them.

Without knowledge of Bateson's observations, Kreidl carried out a series of experiments with the view of testing the powers of hearing in the goldfish. This species was chosen because of the ease with which it could be kept in the laboratory, and, further, because it is one of those fishes that have long been reputed to come at the sound of a bell. After an extended series of experiments, Kreidl concluded that normal goldfish never respond to sounds produced either in the air or in the water, though they do react to the shock of a sudden blow given to the cover of the aquarium. Individuals rendered abnormally sensitive by strychnine gave no response to the sound of a tuning-fork or a vibrating-rod, even when these were in contact with the water, though the fishes responded at once to such slight shocks as tapping the aquarium, etc., or even clapping the hands vigorously in the air.

To test whether these responses were dependent upon the auditory nerves, Kreidl removed these nerves and the attached ear-sacs from a number of individuals, and, after poisoning them with strychnine, subjected them to stimulation by sound. In all cases they were found to respond precisely as the poisoned animals with ears did. Kreidl, therefore, concluded that goldfishes do not hear by the so-called ear, but that they react to sound-waves by means of an especially developed cutaneous sense, or, to put it in other words, the goldfish *feels* sound but does not *hear* it.

After having reached this conclusion, Kreidl was led to take up a specific case of the response of fishes to the sound of a bell, and an opportunity for doing this was found at the Benedictine monastery in Krems, Austria. Here the trout of a particular basin were said to come for food on the ringing of a bell. Kreidl, however, found that they would assemble at sight of a person and without the ringing of the bell. If they were not then fed, they soon dispersed, and no amount of bell-ringing would induce them to return. If, however, a pebble or a small piece of bread was thrown into the water they immediately swam vigorously toward the spot where the disturbance had occurred. Moreover, if a person approached the basin without being seen and rang the bell vigorously no response was observed. From these facts Kreidl concluded that the assemblage of the fishes was brought about through sight and the cutaneous sense, and not through hearing, and that the conclusion reached with the goldfish might be extended to other kinds of fishes.

Kreidl's conclusions were supported by the observations of Lee, who studied the reactions of several species of fishes to such sounds as the human voice, the clapping of hands, and the striking of stones together in air and under water. In all of his experiments Lee obtained no evidence whatever of the existence of a sense of hearing, as the term is usually employed, although he found that the fishes were exceedingly sensitive to gross shocks, such as the jarring of their tank or concussions upon its walls. Lee, moreover, called attention to the fact that the papilla acustica basilaris, which is the special organ of hearing in the internal ears of the higher vertebrates, did not occur in the fishes. From the observations and experiments of Bateson and of Kreidl, and from his own work, Lee believed that the conclusion was justified beyond doubt that fishes do not possess the power of hearing, in the sense in which the term is ordinarily used, and that the sole function of the ear in fishes is equilibration.

The generalization to be drawn from the work just summarized, namely, that fishes do not hear, though they may respond to sound-waves by the skin, has seemed to me not wholly in accord with certain well known facts in the natural history of these animals. Among these facts may be mentioned the undoubted ability on the part of some fishes to make sounds. If a fish has this power it might naturally be supposed to hear the sounds it makes. Lee has called attention to the small number of sound-producing fishes as evidence against the view that fishes in general hear. But the fact that there are such fishes has always appealed to me in quite the reverse way, and should, in my opinion, serve to indicate the species most worthy of attention in any investigation of the sense of hearing. It must be admitted, however, that fishes may possibly produce sounds that they themselves cannot hear, but that other animals may hear and take warning from. Thus when small swellfish are thrown into a tank containing hungry scup, they are immediately set upon by the latter. In defense the swellfishes inflate themselves with sea water till their tegmentary spines stand out rigidly, and at the same time they make a peculiar sound by gritting the two front teeth of the lower jaw against the inner surface of those of the upper jaw. It is not known that this sound is heard by the swellfish, though it may be. All that one can say with certainty is that the sound seems to be directed against the foe, for it is made, so far as I know, only when the swellfish is molested. Granting, however, that the swellfish does not hear its own sound, one would still be rash to conclude that this was an argument against the hearing of fishes, for the vast majority of animals toward which the sound is directed are fishes themselves, and these presumably hear the sounds.

Another good instance of the production of sound by a fish is found in the squeague or weakfish. The grunting noise made by this fish is, however, produced only by the males, and this specialization is very difficult to understand unless one assumes an ability on the part of one or other sex to hear. Since the sounds made by both the swellfish and the squeague are in no sense shocks or concussions, but resemble more closely, in rate of vibra-

tion and in intensity, such sounds as might be obtained from the ordinary action of an instrument like a tuning-fork of low pitch, it seems to me that they afford evidence in favor of the sense of hearing rather than the reverse.

A second reason for questioning the generalization advocated by Kreidl, and by Lee, is the character of the observations upon which it is based. Both authors state that no positive evidence in favor of hearing could be obtained. But it must be borne in mind that in many animals known to possess a sense of hearing the auditory reflexes are perhaps the least conspicuous of any connected with the more important sense organs, and that consequently the most careful scrutiny of the movements of fishes must be made before one can with certainty declare that hearing is absent. A perusal of the papers already summarized led me to the conclusion that something more might be attained in this direction, and I therefore resolved to give particular attention to the reactions of a few fishes with the view of ascertaining whether or not they showed any evidence of hearing.

At the outset I thought it best to experiment on some common sound-producing species, and for this purpose I did some preliminary work on the swellfish, the squeague, and the sea robin. To all of these, practical objections were found, and I was at last obliged to abandon them for fishes that produce no sounds. Among these, three species were found to be especially sensitive to slight vibrations—the kingfish (*Menticirrhus saxatilis*), and the two common species of killifish (*Fundulus majalis* and *F. heteroclitus*). Because of the great abundance of *F. heteroclitus*, the ease with which it could be operated upon, and its great hardiness, I chose it for study, and the observations recorded on the following pages, unless otherwise stated, refer to this species.

The ears in *Fundulus heteroclitus*.—When a tank containing a number of *Fundulus heteroclitus* is struck with the open hand so that the fish cannot see the movement of striking, they respond to the vibrations by springing suddenly an inch or so through the water. The question to be considered is whether these vibrations stimulate the fishes through the skin, the lateral-line organs, the ears, or some combination of these. If it could be shown that the ears were not stimulated by the vibrations, it seems to me that we would have evidence pointing to the conclusion that the fishes did not hear. If, on the other hand, it could be demonstrated that the vibrations did stimulate the ears, the evidence would be conclusive that the animals possessed the sense of hearing. To test these points considerable experimentation was necessary.

Although the experiments already described remove every reasonable doubt from my mind as to the ability of these fishes to hear, the objection may still be raised that the conditions under which they were carried out were so artificial that they may be said to have almost no bearing on the ordinary habits of *Fundulus*, and it must be admitted that the relatively small volume of water in the aquarium and the character of its walls as reflecting surfaces for sound, may possibly have introduced factors to which the fishes, in their natural surroundings, were not accustomed. To ascertain how much weight should be given to this objection the following experiment was tried. The sounding apparatus, consisting of the sounding board and the bass viol string, was taken from the aquarium and set up in the open water of the outer pool at the Fish Commission wharf. The fish cage was hung at a distance of 50 centimeters (20 inches) from the sounding board and toward the center of the pool, which is about 100 feet wide. The sound, therefore, was as unrestricted as that which naturally reaches these fishes. On experimenting with normal fishes, fishes without ears, and those with insensitive skins, results were obtained essentially like those observed in the aquarium, and I therefore concluded that the restriction of the water in the aquarium played no essential part in the results obtained from that apparatus. There is, thus, good reason to believe that *Fundulus heteroclitus* not only hears, but that for it hearing is a normal process.

Conclusions Concerning the Lateral-line Organs and the Skin.

The observations on *Fundulus* recorded in the preceding pages give no support to the view of P. and F. Sarasin that the lateral-line organs are to be regarded as accessory ears, for individuals in which the eighth nerves had been cut and in which the lateral-line organs were intact did not respond to the sound-waves from a tuning-fork to which fishes with ears reacted with certainty. I have also seen no reason to suppose that the lateral-line organs are especially connected with the production of gas in the air-bladder, as suggested by Richard, or that they are particularly concerned with equilibration, as advocated by Lee. Since they are stimulated by slight disturbances in the water that do not affect the general cutaneous sense organs, I can not agree with Merkel in classing them as tactile organs. Their appropriate stimulus is a slight mass-movement of the water, which may or may not be vibratory, and which induces the fish to swim into deeper regions. This form of stimulus is of precisely the kind that was attributed to these organs by Schulze (1870), but I have not been able to confirm Schulze's further opinion that current and surface wave movements stimulate these parts. Such stimuli certainly do affect the general cutaneous sense organs, but whether or not they influence the lateral-line organs I am unable to say.

Summary.

1. Normal *Fundulus heteroclitus* reacts to the sound waves from a tuning-fork of 128 vibrations per second by movements of the pectoral fins and by an increase in the respiratory rate. It probably also responds to sound waves by caudal-fin movements and by general locomotor movements.
2. Individuals in which the eighth (auditory) nerves have been cut do not respond to sound waves from the tuning-fork.
3. The absence of responses to sound waves in individuals with several eighth nerves is not due to the shock of the operation or to other secondary causes, but to the loss of the ear as a sense organ.
4. *Fundulus heteroclitus* therefore possesses the sense of hearing.
5. The ears in this species are also organs of prime importance in equilibration.
6. Normal *Fundulus heteroclitus* swims downward from

the top of the water and remains near the bottom when the aquarium in which it is contained is given a slight noiseless motion.

7. Individuals in which the nerves to the lateral-line organs have been cut will swim upward or remain at the top while the aquarium is being gently and noiselessly moved.

8. The lateral-line organs in this species are probably stimulated by a slight mass movement of the water against them. They are not stimulated by sound waves such as stimulate the ears.

9. Individuals in which the nerves to the lateral-line organs have been cut swim downward and thus escape from regions of surface wave action. They also orient perfectly in swimming against a current. Since surface waves and current action stimulate fishes in which the nerves to the lateral-line organs and to the ears have been cut, these motions must stimulate the general cutaneous nerves (touch).

10. The vibrations from a bass-viol string when transmitted to water stimulate the ears and the lateral-line organs of *Fundulus*. They also stimulate mackerel and menhaden, but not the smooth dogfish, which responds only when in contact with solid portions of an aquarium subjected to vibrations.

Bass Sizes and Weights.

The following list of black bass reported in a competition given by the Toronto Star, affords some data for comparing sizes and weights. Mr. Hugh Neilson writes: "In 1901 the winning small-mouth, caught at Hastings, on the Trent River, weighed 6 pounds 4 ounces. It was pushed hard by another caught in Lake Rosseau, Muskoka, which I saw weighed two or three hours afterward, bringing the scales down at 6 pounds 3 ounces. If weighed promptly, it would have gone another ounce, without doubt. Last year I think the heaviest fish was under 6 pounds."

The Star's record follows: The \$15 prize rod offered by the Toronto Star to the person catching the largest small-mouthed black bass in Ontario on or before Sept. 15, will be presented to John James Irwin, a young farmer of Smith township, in Peterboro county, who, on July 29, in Clear Lake, while fishing with a hook and line and a cedar pole, caught the largest small-mouth black bass of the season.

The competition closed on Sept. 15, and the delay that has occurred in announcing the result has been due to the work of verifying the particulars about the winning fish. Mr. Irwin lives forty miles back of Peterboro, and when he made his catch he did not know about the prize rod offered by The Star, so the fish was made ready to be cooked, salted and put away, the head erected on a pole in the sun to dry. Next day he spoke of his catch to Mr. D. Moore, of the Crown Timber Lands Office, Peterboro, who told him that he should enter it for the prize rod, which he therefore did, making an affidavit to the facts before Mr. D. W. Dumble, K. C., who sent it in. The head of the fish was secured by us, and found to be that of a small-mouth black bass. As to its weight and measurements, we have secured four separate affidavits, one from Irwin himself, one from his mother, one from Mr. Philip Card, a witness, and another from Mr. Adam Hall, of Peterboro, who, accompanied by Mr. Benjamin Sherley, of Peterboro, went to the Card home in Cavendish township, and tested the scales on which the fish was weighed. Through the kindness of these gentlemen and of Mr. D. W. Dumble, K. C., of Peterboro, the scales were not only tested, but were sent to us to be tested at this office.

The weight of this fish was so large that very careful inquiries were made by us before determining that Mr. Irwin had fairly earned and was entitled to the rod. We are perfectly satisfied of that, and the prize will accordingly be sent to him, so that next year he will whip Clear Lake with something better than a cedar pole. But he is not likely to catch anything bigger than he got on July 29. The fish entered for the prize were as follows:

John James Irwin, Smith Township, Peterboro county, a black bass, caught on July 29, in Clear Lake, Cavendish Township, 23 inches long, 17 inches in circumference, weight 7 pounds.

J. D. Reesor, Campbellford, a small-mouth black bass, caught in Bellmont Lake, Labor Day, Sept. 7, weight 6 pounds 5 ounces.

C. Swartz, Buffalo, N. Y., on July 23 caught a small-mouth black bass, in Silver Lake, Port Carling, 21 inches long, 17 inches in circumference, weight 6 pounds 4 ounces.

E. G. Rooke, Port Hope, on July 31 caught a small-mouth black bass, in Rice Lake, 22½ inches long, 15¼ inches in circumference, weight 6 pounds ½ ounce.

Fred Herchmer, Bobcaygeon, caught a small-mouth black bass, in Pigeon Lake on Aug. 21, length 20 inches, circumference 14 inches, weight 6 pounds.

John Brown, Toronto, July 30, caught in Bellmont Lake a small-mouth black bass 19½ inches long, 16 inches girth, weight 5 pounds 9 ounces.

Mrs. E. V. Hays, Crafton, Pa., on Aug. 17 caught a small-mouth black bass at Jackson's Point 22½ inches long, 14½ inches girth, weight 5 pounds 8 ounces.

A. M. Phillips, Pittsburg, Pa., Sept. 1 caught a small-mouth black bass in Stony Lake 21 inches long, 14½ inches girth, weight 5 pounds 8 ounces.

F. H. Smith, Toronto, Sept. 7 caught in Tobacco Lake, Manitoulin Island, a small-mouth black bass, 21½ inches long, 15½ inches girth, weight 5 pounds 7 ounces.

Wm. Leatherman, Pittsburg, Pa., Sept. 12 caught a small-mouth black bass in Bass Lake, near Orillia, 22 inches long, 17 inches girth, weight 5 pounds 14 ounces.

Miss Wardrobe, Lindsay, on July 28 caught a small-mouth black bass at Rosedale, on Balsam Lake, length 20 inches, 17 inches girth, weight 5 pounds 8 ounces.

Alex. Purser, Bensfort, on July 3 caught a small-mouth black bass in Rice Lake 21 inches long, 18 inches girth, weight 5 pounds 7½ ounces.

Chas. E. Siddle, Stratford, on July 1 caught a small-mouth black bass 22 inches long, 16½ inches girth, weight 5 pounds 6 ounces.

Mrs. Isaac W. Cakefair, New York, on Sept. 17, at Charleston, Ont., caught a small-mouth black bass 20½ inches long, weight 5 pounds 3 ounces.

Lieut. A. W. Jamieson, Kingston, on Aug. 12 caught a small-mouth black bass in Bass Lake 19½ inches long, 14½ inches girth, weight 5 pounds 3 ounces.

W. H. Maibour, Buffalo, N. Y., on Aug. 13 caught a small-mouth black bass in Lake Simcoe, length 30 inches, girth 15 inches, weight 5 pounds.

Mrs. A. Wilcox, Toronto, on Aug. 18 caught a small-mouth black bass in Trout Lake, near North Bay, weight 5 pounds.

John R. Ramsay, Hackensack, N. Y., on July 22 caught a small-mouth black bass in Grippin Lake, length 20½ inches, girth 13½ inches, weight 4 pounds 14 ounces.

A. J. Wilcox, Byng Inlet, on July 12 caught a small-mouth black bass, length 19¾ inches, girth 14 inches, weight 4 pounds 13 ounces.

K. M. Martin, Hamilton, on Aug. 11 caught a small-mouth black bass in Blackstone Harbor, length 18½ inches, girth 12½ inches, weight 4 pounds 12 ounces.

W. S. Howell, New York, on July 24, caught a small-mouth black bass in Charleston Lake, length 21 inches, girth 14½ inches, weight 4 pounds 12 ounces.

R. J. Koffend, Orillia, on July 25, caught a small-mouth black bass in Lake Couchiching, length 21½ inches, girth 14¾ inches, weight 4 pounds 9 ounces.

E. N. Baer, Newcastle, Pa., on July 23 caught a small-mouth black bass in Clear Lake, length 21½ inches, girth 16 inches, weight 4 pounds 8 ounces.

Fred Barker, Toronto, on Aug. 18 caught a small-mouth black bass, length 20 inches, girth 15 inches, weight 4 pounds 4 ounces.

Rev. Dr. Lindsay, Rochester, on Aug. 28 caught a small-mouth black bass in Muskoka Lake, length 20½ inches, girth 14½ inches, weight 4 pounds 2 ounces.

Geo. Hughes, Toronto, on Aug. 14 caught a small-mouth black bass in the Rouge River, length 18½ inches, weight 3 pounds 9 ounces.

A Walk into the Wilds.

THIS is merely the story of a trout fishing excursion during which very few trout were caught, and those not remarkable for size. In fact, the fishing was so poor that for most of the time we desisted from fishing entirely, and were content merely to lie about the camp, or leisurely stroll about in the unbroken forest "far from the madding crowd," and observe such signs of animal life as may be found in such a wilderness. So much as preface to the narrative.

In May my brother and myself struck out, with packs on back, to travel through the woods ten or fifteen miles to Tea Creek, aiming to strike the headwaters of the East Fork. We had an interesting outing of three days, and caught many fish. In August, 1903, we set out over practically the same ground, and it is of this latter trip we write. Many men have made far greater journeys in the course of a strenuous life, experienced sensations of greater fatigue and hunger than we, and remained silent. They may, too, have been more profoundly impressed with the "pleasure of the pathless wood" than we, yet lacked the desire to transcribe their inmost thoughts on paper, so that all that run may read.

The tribe or sect of Nature Worshippers, however, is becoming more numerous every day, some by adoption and others to the manor born, and they yearn to express something of that which we "can ne'er express, yet cannot all conceal." Of these Thoreau was the most brilliant exponent, evidenced by the esteem in which his books on nature study are in demand.

All people have by them a means of locomotion, no matter how poor they be, that, if properly used, will carry them at very slight cost into a fairyland of enchantment, the world of outdoors. In other words, legs are made to walk on. In no other way than by walking can one achieve that absolute freedom of movement, a kinship to the wild animals and savages, with their magnificent development and endurance.

We set out at 4 A. M. strong in purpose to reach our destination by noon, and begin the sport. This we accomplished by hard walking over very steep and rough ground, through all but impassable thickets, interspersed with fallen timber. We aimed to strike the "low place" on Spruce Knob (5,000 feet), where in a very small area the head springs of Tea Creek, Laurel Creek, and Crooked Fork of Elk River are found; and the unwary woods runner is apt to follow either of these streams by mistake. A "blaze" is to be looked for in this "low place," which leads in rather a circuitous manner on to the waters of Tea Creek. This high mountain is a resort for bear. We observed the fresh tracks of a bear in a muddy place, and also saw where one had lain in the weeds.

We located the "blazed trail," which in due course of time brought us to the fishing grounds.

But so far as fishing went, we were doomed to disappointment. Our most diligent efforts failed to secure more than a dozen small trout. We hastened to camp at the forks and falls, where a log shack was built twenty years ago by a man who acted as claim protector for a large tract of land owned by a syndicate. A wilder or more beautiful spot could not be imagined. The place is wholly remote from any route of travel, only reached by hard trailing over rough mountains, or following the bed of the still rougher stream.

We made our camp here for two nights, and while we suffered privations from the lack of bread and other things to eat, thoroughly enjoyed the "boundless continuity of shade."

Upon visiting a deer lick near by, we found the fresh and muddy tracks of a deer. We observed that after taking up our abode in the camp various species of birds that inhabit the deeper woods came and lingered about the camp, as though attracted by the proximity of human beings, or by curiosity.

Aside from getting wood, doing the necessary cooking, bathing in the large pool below the falls, our time was partly occupied in inscribing on a log of the shack, smoothed with the ax, the following sentiments:

"A book of verses underneath the bough,
A Jug of Wine, a loaf of bread, and Thou
Beside me singing in the Wilderness,
Ah, Wilderness were Paradise enough!"

Also:

"There is a pleasure in the pathless wood;
There is a rapture on the lonely shore;
There is society where none intrude
By the lone sea, and music in its roar;
I love not man the less, but Nature more.
From these our solitudes in which we stray,
From what we may be, or have been before;
To mingle with the Universe, and tell
What we can ne'er express, yet not all conceal."

May we never get too old, or bound by the conventionalities and love of ease, to appreciate the peculiar ecstasy of "running wild" in the woods for a season, even only a day or two at a time. Surely we ought to take time to examine and admire the natural world which the Creator pronounced "very good."

The reminiscent pleasure of the trip is much added to by the photographs we were able to secure with the little pocket kodak that accompanies us on all our excursions as a matter of course. These souvenirs help in a wonderful way to recall the scenes and experiences of

the past. The picture catches the "fleeting shadow," and freshens the image in the mind years after. The memories of a life rich in varied experiences and worthy deeds is the base of the formation of a noble character; just as the reverse of ignoble deeds weighs down the mind to lower degrees of degradation.

On the morning of the third day we set out for the settlements. By this time the grub was out, and breakfast was very light. In our hurry to get back to the base of supplies, we struck out by what we figured to be a nearer way, and on top the mountain found ourselves above the clouds and really lost. After trying for some time to get a direction, we struck down the first waterway,

NEAR VIEW OF PART OF FALLS.

though we realized it was taking us back toward the starting point, and after six hours' walking we struck Tea Creek again, about one mile below the Forks! The stream proved to be the Twin Licks Run, and we managed to get a number of trout from it. At the mouth of this run we were fifteen miles from home, which distance we walked by the "long," but familiar, way, arriving at 7 P. M. We estimated the day's travel over very rough country at thirty-five to forty miles.

Judged by the hard standards of actual achievement, not much is accomplished by such a trip. But the

CAMP AT THE FORKS—PRIMORDIAL MAN.

senses of seeing, hearing and smelling are trained to sensitiveness; the body made used to endurance, and "hard as nails," fit to enjoy living.

We have observed that after a few days spent in the woods and with their scent in our nostrils, we could distinguish smells, and almost follow a deer by scent, we have imagined. The bushmen of Australia are said to possess unusual olfactory powers, almost equal to that of the dog, and follow game by trailing with eye and nose. Nature equalizes her gifts by giving to one species keenness of vision, to another acuteness of hearing, smelling, etc.; and each is developed by the needs and environment of the individual—an "evolution of sense."

Most of us cannot, like Thoreau, walk four hours daily in the woods and fields for we have employments that exact our best efforts; but we can occasionally experience the feeling of the primordial man by a walk into the wilds.

NORMAN R. PRICE, M.D.

WEST VIRGINIA.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Massachusetts Fish and Game.

BOSTON, Mass., Oct. 31.—*Editor Forest and Stream:* The work of distributing the product of the hatcheries and aviaries by the Massachusetts Commissioners for the year is nearly completed. In addition to the 90,000 fingerling trout mentioned in a former letter, there have been distributed 1,000,000 trout fry, 2,500,000 pike perch fry, 400 Mongolian pheasants, and 200 Belgian hares, these figures of each variety being about double those of any previous year. With each consignment a deputy is sent to see that they fall into proper hands and are put out in a suitable manner so as best to serve the purpose for which the State maintains its rearing establishments. All this is an advance on the method of distribution in vogue a few years ago. The Commissioners express themselves as highly gratified with their success in pheasant rearing, and (in addition to those distributed) are holding 125 young birds over to be liberated in the spring. The birds are sent out in flocks of from six to ten in suitable boxes, and grain is scattered about before they are liberated so as to induce them to remain about the locality where they get their first taste of freedom. A friend just returned from Warcham informs me that he saw three of these birds in the woods a mile or two from the village. Probably those were birds that flew out of Mr. E. D. Jordan's preserve in Plymouth, as I believe that is several miles nearer the spot where the birds were seen than any of the places to which birds have been sent by the Commission. Among sportsmen whose views I have learned there seems to be less doubt of the ability of the birds to stand the cold of our winters than of their substantial value as game birds. Some say they are "runners," and will not flush well before a dog. However that may be, in case they become plentiful they will furnish an added attraction to the covers and by-ways. In the report of the Commission for 1902, Capt. Collins says: "There is no apparent reason why the Mongolian pheasant should not do almost as well here as in Oregon, where it is conceded the foremost game bird of the State." That those which have been liberated the past few years are breeding, and in many cases rearing large broods in a wild state, there is no doubt.

At New Bedford several Sunday gunners at Fall River have just been fined in the district court. The violations occurred at Horse Neck Beach in Westport. Six men were "pinched," among them Mr. J. P. Sullivan, a prominent mill official, and Mr. A. A. McCaulis, secretary of the Fall River Board of Trade.

On Sunday last, the reservoirs in Winchester in the neighborhood of the "Fells" were bedded with thousands of game birds. The birds seem to be aware that within the limits of the reservation they are protected, and there they congregate, assured of a "haven of rest." Within the last few years several reservations have been established by the Massachusetts Legislature, including the upper portions of Mount Wachusett, Mount Tom (provisionally), and Greylock. Several trustees of these lands have been on a visit to Berkshire the past week, among them President Elliott, of Cambridge, Mr. John Woodbury, secretary of the Metropolitan Park Commission, and Charles Rackeman, of Boston. While these reservations were not set apart for the express purpose of game preservation, they will unquestionably prove valuable as game refuges, and will contribute in no slight degree to the increase of game in the country surrounding them. As an illustration, it is recalled that the regions around the Blue Hills Reservation, consisting of several thousand acres, have had a great increase in the abundance of quail since the Hills became a part of the park system of Greater Boston. The sportsmen of the State, foreseeing these benefits to bird and animal life, have been warm advocates of bills that have come before our legislators from time to time for the establishment of reservations. For similar reasons the friends of true sport should do all in their power for the establishment of national refuges for game.

Among Massachusetts hunters recently returned from Maine with game are A. D. Thayer, of Franklin; F. H. Neal, S. A. Ordway, F. S. Snyder, and F. E. Woodruff, of Boston. Those who have secured a moose are J. B. Baxter, M. Crabtree, of Boston, and two Worcester sportsmen. T. H. Wheeler, Boston, brought out a bear.

Mr. and Mrs. H. W. Spaulding and several friends have been occupying the private camps of Mr. W. W. Spaulding, of Haverhill, at Lobster Lake for several days, and Mr. Spaulding has brought out two deer.

The shipments from Bangor for the week ending Friday, October 23, were 399 deer, 33 moose, and 4 bears. For the corresponding week of last year they were 550 deer, 29 moose, 2 bears. The shipments of deer for the season up to that time show a falling off of 276 from those of last year.

A record load of game was brought into Machias by Messrs. J. W. Day and H. E. Kilton. It consisted of an enormous bull moose, three buck deer, and a milk white doe, all shot in the vicinity of Chain of Lakes, a region noted for big game. Mr. Kelton had a thrilling experience in getting the moose, his first shot, fired from his canoe, only maddening the beast. His second was a miss, and then he was obliged to paddle for dear life. Finally he succeeded in sending a rifle ball into a vital spot of the animal, which put an end to the battle. The great preponderance of bucks brought in from the Kineo region, being about 3 to 7, indicates prime conditions for sport.

One result to be expected from the license law is that hunters are showing unusual persistence in their efforts to secure a moose as well as their two deer. They will naturally go to those sections where moose are reported to be abundant. Messrs. W. Fitch, of Winchester, and Charles Darling, of Boston, have gone into the woods from Patten, and Messrs. E. H. Gould and Dwight Foster, of Beverly, have gone to Shin Pond and Sebosis in the hope of securing moose. A comparison of reports from various sources indicates that the number of hunters in the Moosehead region is hardly half that of a year ago at this season, but nearly all have been quite successful in securing game. The first week of November is likely to witness a large accession to the number of visitors at the camps. Mrs. W. Fenlason, of Boston, is reported to be the first non-resident woman to secure a deer in that part of the State this year.

From New Hampshire comes a report of a sad shoot-

ing accident at Lower Bartlett, where Martin Walker, 12 years old, mistook Herbert Cook, a lad 17 years old, for a deer and killed him on the spot with a rifle ball through the head.

The first deer to be shot on Long Island in Lake Winnepegossee was brought in by two Lakeport gunners and weighed 250 pounds.

From Chester, Vermont, comes a report that a bear was shot the past week by Mr. M. Howard that measured 8 feet in length, on Mt. Tabor; and on the same day two deer were secured, one weighing 200 pounds, the other 270 pounds. From Vergennes, Vt., game warden J. B. Preston reports that while in Ripton, camped on the land of Joseph Battell, in company with several hunters, he was warned off. He believes the owner's claim will not be upheld by the courts and proposes to make of it a test case.

In the death of Hon. John E. Russell, of Leicester, Massachusetts has lost one of her foremost citizens. While not a member of the State Association, he was greatly interested in the preservation of our birds and animals, and lent his commanding influence to further the objects of the Association, as shown in a letter received from him by your correspondent at the time of the formation of the central committee for protection of fish and game.

CENTRAL.

Shenandoah Black Bass.

WINCHESTER, Va., Oct. 27.—*Editor Forest and Stream:* Some fine small-mouth black bass are being taken from the Shenandoah River this month. The bass seem to be in a biting humor, and some fine catches are being made.

Councilman Lewis F. Cooper and Mr. H. W. Clowe were out recently at Wright's Mill, near this city, and Mr. Cooper landed one that weighed about 7 pounds, the largest that has been caught around here in years. Mr. and Mrs. Huntsberry were out several days ago and also caught a nice bunch. These parties used live bait altogether.

National Beagle Club of America.

CAMDEN, N. J.—The entries for the fourteenth annual field trials of the National Beagle Club of America, which start at Howardsville, Virginia, on November 9, 1903, closed on October 26, with the following result.

Open Class A—For dogs all ages over thirteen inches, and not over fifteen inches, 15 entries.

Open Class AA—For bitches, all ages, over thirteen inches and not over fifteen inches, 15 entries.

Open Class B—For dogs and bitches, all ages, thirteen inches and under, 19 entries.

Derby, Class C—For dogs and bitches, fifteen inches and under, whelped on or after January 1, 1902, 13 entries.

The entries for the pack stakes close at ten o'clock of the day preceding the running of the class.

CHAS. R. STEVENSON, Secretary.

Bob and Bill.

MILFORD, Mich., Oct. 27.—J. N. Weaver's dog Bob, as has been proven, is more sagacious than most of the canine family. One day last week one of our business men lost a \$10 bill on the street. He missed it at once, and immediately instituted a search.

About the time the bill was dropped, Bob was out for his morning constitutional, saw the money on the sidewalk, picked it up and carried it to his master's office. When the dog returned no one paid him any attention, but "knowing Bob" continued to stand and persistently wag his tail, until at last Mr. Weaver turned to see what he wanted and discovered the money in the dog's mouth.

It was not long, however, till the rightful owner appeared on the scene, claiming the money and feeling very grateful to Bob.—Detroit Tribune.

The Western Massachusetts Fox Club.

WESTFIELD, Mass.—Our sixteenth annual hunt will be held at Westfield, Wednesday and Thursday, Nov. 11 and 12.

The hunters' horn will sound at 5 o'clock on Wednesday morning for breakfast. At 6 o'clock carriages will be ready at the Park Square Hotel to carry the hunters to the grounds.

The annual club dinner will be served to members and guests at 6:30 o'clock on the evening of the first day's hunt.

Kindly notify the secretary by November 6 if you can attend. This is imperative, in order that proper arrangements may be made for the banquet. We hope to be favored with your presence.

T. J. CLEARY, Secretary.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of *FOREST AND STREAM* offer prizes for the best stories of cruises submitted to be published in *FOREST AND STREAM*. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.
Second prize, \$50.00.
Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.
2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.
4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.
5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.
6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.
7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

ALTHOUGH the New York Y. C. has received no direct or official word about the cup that Emperor William, of Germany, is to offer for trans-Atlantic yacht racing, still it is accepted generally as being a fact, and that the club will soon be approached on the subject.

When Sir Thomas Lipton heard that the German Emperor contemplated offering a trophy for ocean racing, he withdrew the offer he made to the Atlantic Y. C. a short time ago. Telegraphic messages were exchanged between Emperor William and Sir Thomas Lipton, which were made public, and we publish them.

To Emperor William from Sir Thomas Lipton:

I hear from the Atlantic Yacht Club that Your Majesty contemplates offering a cup for a trans-Atlantic yacht race in 1904, but that some question has arisen on account of a similar offer by myself.

In the best interests of the sport of which Your Majesty has always been an enthusiastic exponent, I am only too willing to ask the consent of the Atlantic Yacht Club to withdraw my offer for 1904, and most respectfully and heartily tender Your Majesty such support as lies within my power to make a trans-Atlantic race for your cup in 1904 a thoroughly representative international event, which under your imperial auspices it could scarcely fail to be.

Two trans-Atlantic races the same year would hardly be satisfactory to the contestants, nor provide an efficient test of the highest yachting skill, endurance and workmanship.

I feel certain that these reasons, which prompt this offer of withdrawal, would appeal to the authorities of the Atlantic Yacht Club, and that they, jointly with the New York Yacht Club officials, would gladly carry out such arrangements as Your Majesty might suggest and agree with me in desiring to do everything possible to show keen appreciation of the generous interest Your Majesty has repeatedly evinced in the advancement of yachting in all countries.

Upon receiving your distinguished approval, I will cable to New York a definite withdrawal of my offer for 1904.

Emperor William answered as follows:

NEUES PALACE, Oct. 28, 1903.

Sir Thomas Lipton, London:

I am most grateful for your kind telegram. My offer was not made earlier, as I was unable to find out whether you intended to build for 1904. Consequently, I feared to disturb your plans in case you were preparing a new challenge for the America's Cup. I was informed by my Ambassador, who will offer my cup to the two clubs, that in the same time a similar offer had been made by you.

I at once resolved to leave it to the officers of the Atlantic Yacht Club and the New York Yacht Club to decide which offer would be acceptable to them, as I fully agree with you that two trans-Atlantic races in the same year would hardly provide satisfactory sport or results. Your resolve to withdraw your offer for my sake has deeply touched me and I hasten to thank you for your generous intention and accept your proposal.

I was prompted to offer a cup in hopes of encouraging ocean racing, with the view to stimulate designers and builders into producing a class capable of keeping the open sea easily and combining seaworthiness with safety

and comfort, without sacrificing everything to speed—i. e., to develop a sound type of cruiser. I believe this class of yacht would most appeal to those who love the sea and who do not wish to use their craft exclusively for racing purposes.

With your generous withdrawal you have magnanimously tendered your support to make a race for an Atlantic cup a success, thereby serving the great cause of yachting racing, the finest sport in the world, the development of which I have so much at heart.

Once more, my most sincere thanks.

WILLIAM, I. R.

We doubt very much if the New York Y. C. would care to accept any cup jointly with any other club, and it is to be hoped that Emperor William will present the cup to either the New York or the Atlantic Y. C. We can see absolutely no advantage why this cup should be offered to two clubs. There would surely be friction between the representatives of the two organizations, and no more starters would be attracted, as all the boats large enough to participate in such an event are enrolled in both clubs.

Y. R. A. of Long Island Sound.

THE fall meeting of the Yacht Racing Association of Long Island Sound was held on Thursday, Oct. 29, at the Arena, representatives from practically all of the clubs being present, with Thomas H. Macdonald, of the Bridgeport Y. C., in the chair.

In consequence of the chaotic condition of yachting from the racing standpoint, because of the heterogeneous assortment of measurement rules now in force and the apparent impossibility of reconciling the various clubs to one general rule, as has been proven by the lack of results from the various meetings held during the past six months with this object in view, the Executive Committee presented for consideration by the Association four restricted classes, the adoption of which will result in the elimination of the measurement rule from what is now the 36ft. class down. The classes suggested are 15, 18, 27 and 32 waterline boats, conforming generally to the type popularly known as the raceabout class, which has been the most successful ever raced, and the adoption of these classes, detailed restrictions for which are given below, will not only provide a most satisfactory type of boat, but what is of far more importance, will give definite assurance to those contemplating building of a continuance of the class in which they may build, without as at present, the constantly recurring fear of an annual change of rule.

To permit of the printing and general circulation of the proposed restrictions and their thorough consideration before adoption, the meeting was adjourned until Monday, Nov. 16, when final action will be taken.

The following amendments to the racing rules were adopted:

Rule II. To strike out the last sentence of the sixth paragraph of Section 3, beginning "should the boom when in use," etc.

To strike out Section 9.

Rule III. To abolish the separate classifications of cabin and open sloops, and cabin and open catboats in the 25ft. classes.

To abolish the distinctive lettering of the catboat classes, and reletter such classes with their relative sloop classes.

Section 3. To strike out the words "December 1, 1898," and substitute therefor the words "January 1, 1899."

Section 5. To insert the words "or catboat" immediately after the word "yawl."

To strike out Section 6.

Rule XII. To amend by striking out the present rule and substituting the following: "Except when otherwise specified in the instructions, a race in any class in which no yacht has finished at 30 minutes after sunset, shall be declared off."

Rule XV. To strike out the last paragraph of Section 2.

To strike out Section 3 and substitute the following: "The Race Committee boat when at the finish line, shall display a red ball. The signal to denote the conclusion of the race shall be the lowering of the red ball."

Action on the proposed amendments to the rules was deferred until the March meeting.

To add to Rule XV a new section providing signals for postponing the start for half an hour, postponing the race for day, shortening the course, sailing the course in reverse direction, etc. (in part now covered by Rule XIX).

To strike out Rule XIX.

A nominating committee to select officers for next season was appointed, consisting of O. H. Chellborg, F. C. Sullivan, F. B. Jones, Ward Dickson and Chas. A. Goodwin.

Thirty-Two Foot Sloop Class.

(Conforming practically to present 36ft. sloop class.)

32ft. Sloop Class.—A boat of this class is intended to be a seaworthy boat, with fair accommodations, rigged simply with only mainsail, working headsails and spinaker.

Length Load Waterline.—The length of the load waterline, with full equipment aboard shall not exceed 32ft.

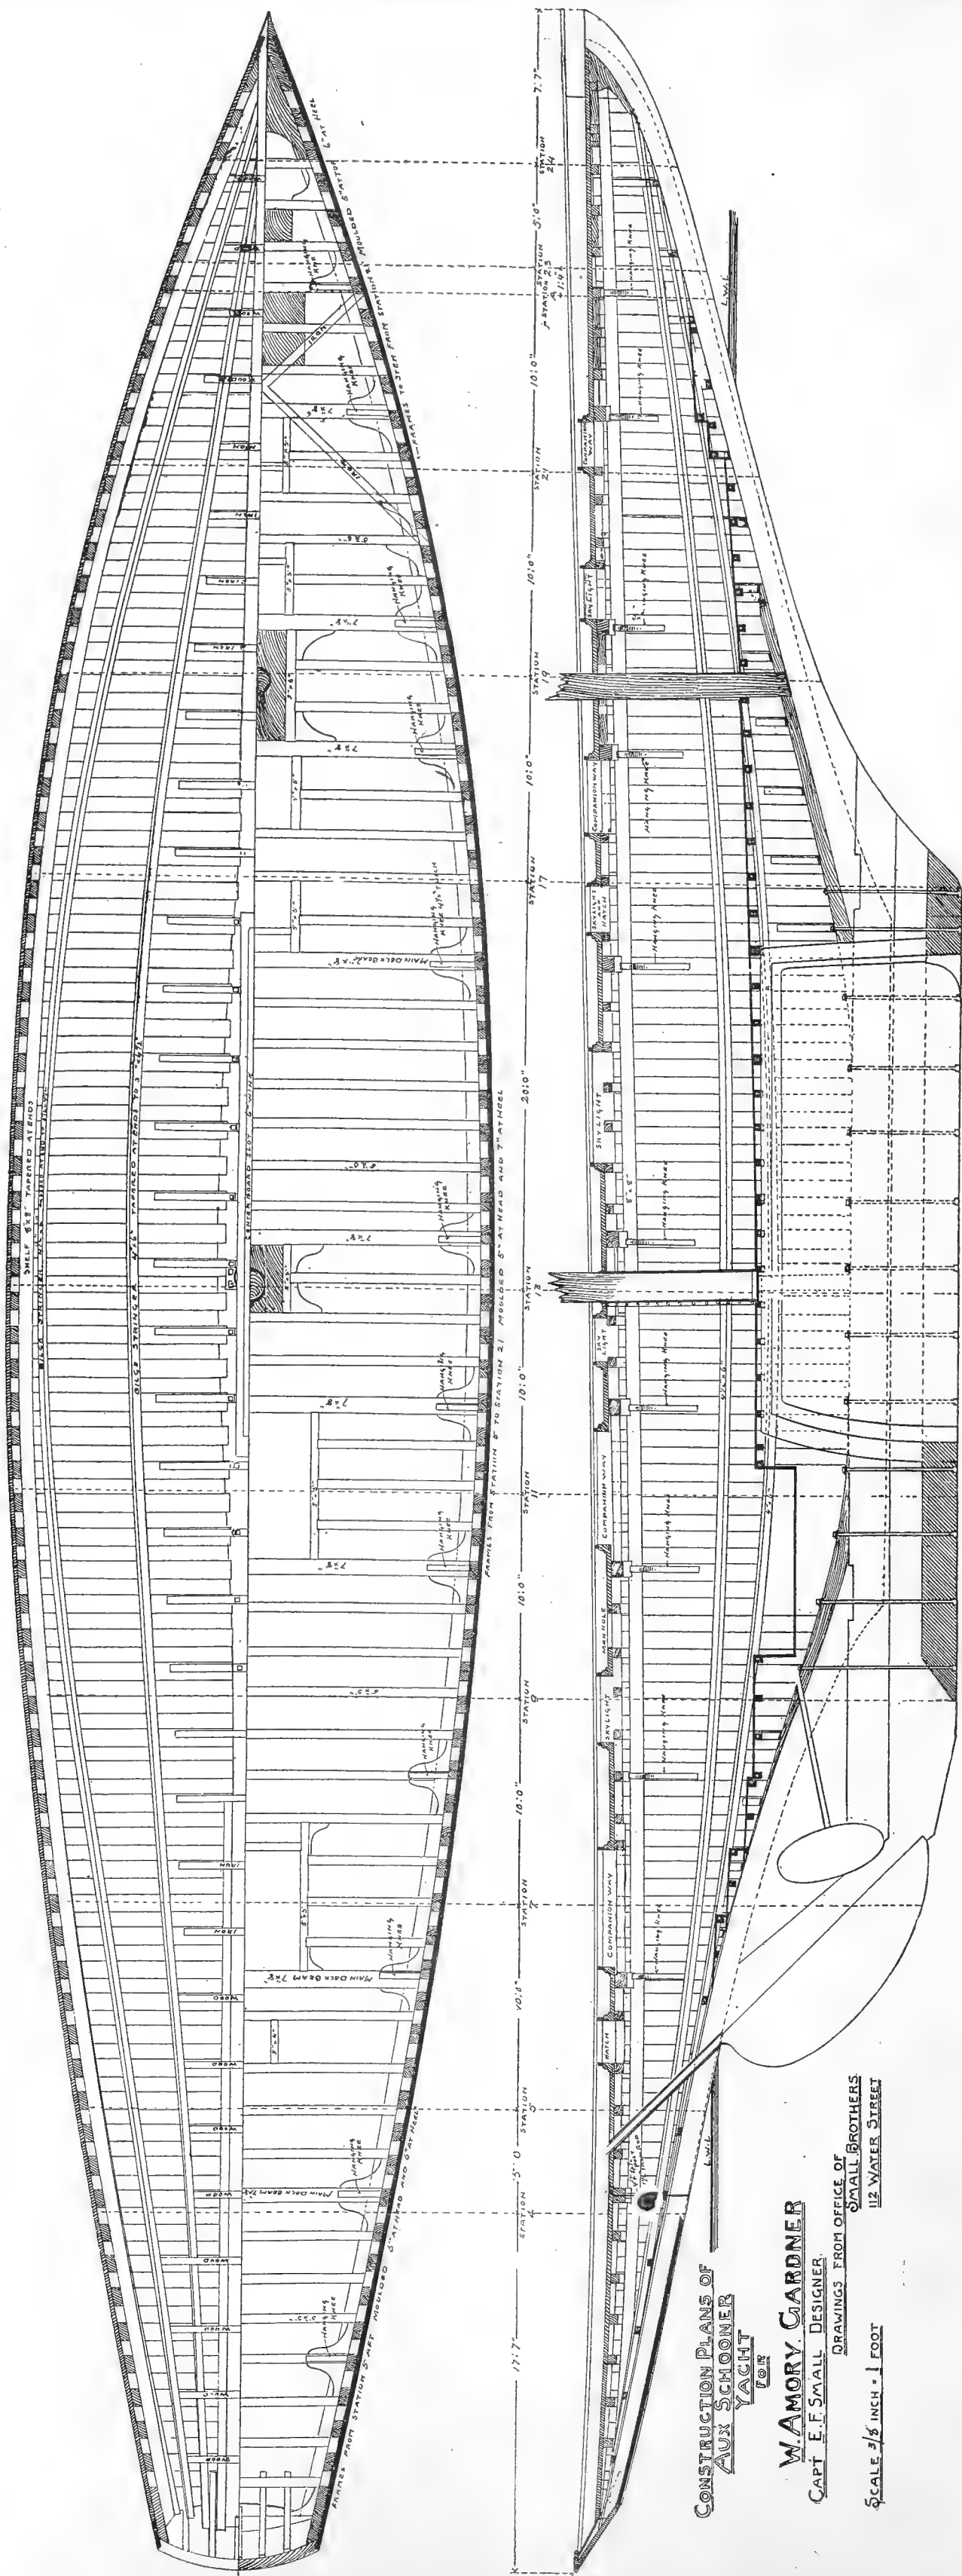

Beam Load Waterline.—The beam at the load waterline in keel boats, shall be at least 10ft, and in centerboard boats at least 11ft. 1in.

Freeboard.—The freeboard shall be not less than 30in. on the said respective required beams, a reduction of 1in. of the freeboard allowed for every increase of 4in. in the beam respectively.

Displacement and Draft.—For centerboard boats the draft shall be not less than 4ft. 6in. for at least 8ft. length of keel.

All boats shall displace when rigged and equipped in accordance with these rules, not less than 23,000 pounds. The affidavit of the designer shall be accepted as evidence of the displacement of a boat.

If through protest the displacement of a boat shall be called in question, the race committee to which protest

is made, shall cause displacement of such boat to be ascertained by the measurer.

The cost shall be paid by the owner if the displacement is found to be less than 23,000; otherwise it shall be paid by the person making the protest.

Scantlings, Planking and Construction.—To be as required for 36ft. cabin class.

Ballast.—Ballast on keel shall not exceed 10,500 pounds.

Sails.—The sail area to be determined as called for in Rule II, Section 3, shall not be over 1,500 sq. ft., and not more than 1,150 sq. ft. of actual sail area shall be in the mainsail.

The spinnaker boom shall be carried on the mast when in use. The extreme distance in feet from mast to end of spinnaker boom, when in position, shall be not more than 1,000, divided by the distance in feet from deck to spinnaker halyard block.

The spinnaker sheet shall not be carried forward of the head stay, nor outside of the leeward shroud.

No battens over 30in. in length allowed to be used in sails.

The forestay shall remain fixed at both ends during a race.

Equipment.—As required for 36ft. cabin class.

Crew.—As required for 36ft. cabin class.

Twenty-Seven Foot Sloop C1 ss.

(Conforming practically to present 30ft. class.)

27ft. Sloop Class.—A boat of this class is intended to be a seaworthy boat, with fair accommodations, rigged simply with only mainsail, working headsails and spinnaker.

Length Load Waterline.—The length of the load waterline, with full equipment aboard, shall not exceed 27ft.

Beam Load Waterline.—The beam at the load waterline in keel boats shall be at least 8ft. 9in., and in centerboard boats at least 9ft. 8in.

Freeboard.—The freeboard shall be not less than 26in. on the said respective required beams, a reduction of 1in. of the freeboard allowed for every increase of 4in. in the beam respectively.

Displacement and Draft.—For centerboard boats the draft shall be not less than 3ft. 9in. for at least 7ft. length of keel.

All boats shall displace when rigged and equipped in accordance with these rules, not less than 13,500 pounds. The affidavit of the designer shall be accepted as evidence of the displacement of a boat.

If, through protest the displacement of a boat shall be called in question, the race committee to which protest is made, shall cause displacement of such boat to be ascertained by the measurer.

The cost shall be paid by the owner if the displacement is found to be less than 13,500 pounds; otherwise it shall be paid by the person making the protest.

Scantlings, Planking and Construction.—To be as required in the 30ft. cabin class.

Ballast.—Ballast on keel shall not exceed 6,500

pounds.

Sails.—The sail area to be determined as called for in Rule II, Article 3, and shall not be over 1,050 sq. ft., and not more than 850 sq. ft. of actual sail area shall be in the mainsail.

The spinnaker boom shall be carried on the mast when in use. The extreme distance in feet from mast to end of spinnaker boom when in position shall be not more than 800 divided by the distance in feet from deck to spinnaker halyard block.

The spinnaker sheet shall not be carried forward of the head stay, nor outside of the leeward shroud.

No battens over 20in. in length allowed to be used in sails.

The forestay shall remain fixed at both ends during a race.

Equipment.—As required for 30ft. cabin class.

Crew.—As required for 30ft. cabin class.

Eighteen Foot Knockabout Class.

Definition.—A boat of this class shall be a seaworthy boat, and not include boats having square sides, or square, snub-nosed bow or metal in fin keel; at least half of over all length, decked and fitted with air tanks of sufficient capacity to float the boat when full of water, or watertight cabin bulkhead, rigged simply with only mainsail, fore staysail, or jib and spinnaker.

Length.—The length on the l. w. l., with full equipment on board, shall not exceed 31ft., and neither forward or aft overhang shall exceed 7ft.

Beam.—The beam at the l. w. l. in keel boats shall be at least 6ft. 1in., and in centerboard boats at least 6ft. 6in. The extreme beam at a point halfway between the forward end of the l. w. l. and the extreme bow shall not exceed 40 per cent. of the greatest waterline beam. The girth of the hull at said point shall not exceed the number of inches represented by the sum of the beam, plus the depth of the hull, plus 3, measured at the same point. The freeboard at this point shall not be less than 22in.

Freeboard.—The minimum freeboard shall be at least 17in. The depth of hull, girth and freeboard shall be measured from the top side of the covering board.

Displacement and Draft.—For centerboard boats the draft shall not be less than 2ft. 6in. for at least 4ft. length of keel.

All boats shall weigh, when rigged and equipped in accordance with these rules, not less than 4,000 pounds, exclusive of inside ballast. It shall be the duty of the measurer to see that nothing is on board when the boat is weighed except what these rules prescribe, and that the boat is in every way in her normal condition.

Scantling, Planking and Construction.—The keel, stem, frames, house and deck beams shall be of oak, or its equivalent in strength. The frames shall be not less than 7/8in.; deck beams not less than 1 1/4in. section. The spacing of frames, deck and house beams to be not more than 9in. center to center. The planking, including the deck and side of house, shall be not less than 3/4in. thick; the top of house shall be not less than 5/8in., both, when finished; except that an allowance of 1/8in. in thickness of deck can be made if it is canvas covered. Deck clamps shall run from stem to stern, with a minimum cross section of 3 sq. in. for at least one-half length; also bilge stringers of at least 3 sq. in. cross section shall run for at least one-half the extreme length of the boat midships. Clamps and stringers to be of yellow pine, or its equivalent in strength.

Sails.—The sail area shall be not over 450 sq. ft. and not over 360 sq. ft. of actual sail area shall be in the

INGOMAR.

The schooner that is to race next season in British and German waters. She was designed and built by the Herreshoff Mfg. Co. for Commodore Plant, Larchmont Y. C. Photo by N. L. Stebbins, Boston.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

It is definitely stated that Mr. George L. Watson has been commissioned to get up a design for a racing schooner 95ft. on the waterline. Although Mr. Watson's schooners have never been successful, he may profit by the failures he made in his earlier boats of this type, and the schooner Ingomar will have a more dangerous rival in her racing on the other side than Cicely, the smart Fife production. There are many rumors afloat as to the owner of the new Watson schooner, but the most persistent is that she is for the German Emperor.

American boats—that is, those which have raced in the larger classes—have never been very successful in British waters, and even though Ingomar is to be in charge of Captain Charles Barr, we do not look for her to do anything astonishing. She will have to give Cicely time, and racing in the handicap classes when one is not accustomed to it is not the easiest thing in the world. While Ingomar was raced a little last summer, still she had nothing very fast pitted against her, and she is in a measure an unknown quantity. But we hope Ingomar will do well on the other side, as it has been some time since an American has raced a big boat in foreign waters, and it would have been better to take a boat across that was designed under the English racing rule and to meet English conditions and requirements.

Mr. H. H. Hoggins, a member of the New York and Atlantic Y. C.'s, has purchased the steam yacht Llewellyn through the agency of Mr. Stanley M. Seaman from the Bannigan estate of Providence.

The Stuyvesant Y. C. of Port Morris closed its fourteenth season on Saturday, October 24. The event was celebrated by an entertainment and dance. The members have found the present club house too small for their requirements, and a new building will be constructed during the winter.

The South Bay Y. C. with headquarters at Patchogue, Suffolk county, L. I., has been incorporated. The organization proposes to encourage yacht building and naval architecture, and the cultivation of naval science; also to encourage the club's members in becoming proficient in the personal management, control, and handling of their yachts, and to promote sociability and recreation among the members. The directors for the first year are as follows: Joseph Bailey, Frank Gutridge, Edwin Bailey, Jr.; John A. Potter and Joseph R. Skinner, of Patchogue; A. Roe, Storms, John N. Silsbe, Lawrence C. Haffner and William E. Ebbets, of New York city, and George L. Robinson and George J. Eiseman, of Brooklyn.

Vice-Commodore Morton F. Plant has been appointed Commodore of the Larchmont Y. C. to fill the vacancy made by the resignation of Commodore Fred T. Adams.

Coming up the Delaware yesterday was the queerest looking craft that ever passed Marcus Hook. It looked like an old canal boat in general shape, but was too narrow of beam for that. It was in tow, together with half a dozen barges, and when it made a landing at Queen street the writer had curiosity enough to go aboard and see what it was like. It was a canal boat, sure enough, but had been metamorphosed into the most comfortable house-boat that could be imagined. Its name was The Mule Yacht, and its owners are two Government clerks from Washington and their wives. They were a jolly party and have been doing the country via canal and river since July. The boat cost \$60 as it stood and \$75 more fitted it out with all the comforts of home. An old colored woman did the cooking and rough work, and the quartette, who had done Europe and this country, said they had had the time of their lives, and traveling on the "yacht" was the acme of enjoyment, besides saving money.—Philadelphia Telegraph.

Word has been received from Bristol to the effect that the Herreshoffs have received an order for a 90ft. waterline steel racing schooner similar to Ingomar, the successful vessel that this firm turned out last year for Mr. Morton F. Plant.

On the evening of October 27 President W. A. H. Stafford and the Board of Governors of the New York Club entertained the Board of Trustees of the Atlantic Y. C. at dinner at the New York Club's house. The officers and members of the Atlantic Y. C. have been extended the privileges of the New York Club, Thirty-fifth street and Fifth avenue, during the coming winter. In return, the Atlantic Y. C. has extended the privileges of its club house at Sea Gate, Coney Island, to the members of the New York Club during the season of 1904. It is quite possible that these two clubs will be consolidated if the above arrangement proves a success.

The Williamsburgh Y. C. went out of commission on October 25. The members met at the club house in the afternoon and the prizes won during the season were distributed by Commodore Long as follows: Spring regatta—Sloops—Saracen, Archie Moran, silver loving cup; Pearl, Commodore Long, silver smoking set; Yankee Girl, E. R. Chapman, silver nut bowl; Florence, August Card, silver smoking set. Yawls: Pastime, James Schuessle, anchor light. Fall regatta—Open sloops: Cornelia, James Taylor, Metropolitan Y. C., silver cutlery set; Pinochle, R. Jacoby, Stuyvesant Y. C., silver loving cup; Pearl, Commodore Long, Williamsburgh Y. C., silver vase; Dagnus, Captain Symmons, Metropolitan Y. C., silver loving cup; Teddy, Jr., Edward Rac, Williamsburgh Y. C., silver loving cup; Eleanor, John McGregor, Stuyvesant Y. C., silver loving cup; Yankee Girl, E. R. Chapman, Williamsburgh Y. C., silver loving cup; Collen, J. Cochran, Strykers Bay Y. C., silver loving cup.

The auxiliary Aloha, owned by Messrs. A. C. and D. W. James, put in at Falmouth, England, on Wednesday,

October 28, having been in collision with the British steamer Zoroaster during the night previous when about 85 miles west of Ushant. The steamer stood by the yacht until daylight, and when it was found she was not seriously damaged, proceeded. Aloha's figurehead was badly injured, and all her head gear was carried away.

Aroostock, the steam yacht recently launched at Morris Heights for Mr. Charles A. Dean, of Boston, made on her trial trip a speed of 12½ knots, exceeding her contract speed by 2½ knots. The yacht will leave for Florida early in November.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. When practicable an outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in. While a chart will count in estimating the events of the log, it is not a necessary factor, and a log may be sent without it.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

The Executive Committee Meeting at Rochester.

THE meeting of the Executive Committee of the American Canoe Association, of its Board of Governors, and of its newly elected Racing Board, were all held at the Rochester Canoe Club, on Irondequoit Bay, Saturday, October 24, 1903.

Out of thirty-one members, there were present, or by proxy, twenty-five; the Board of Governors was represented in its entirety, as was the Racing Board, the latter with two substitutes. This turn-out of the members from the five divisions augurs well indeed for the coming year. The meeting was called to order by Commodore C. Fred Wolters. There were present, beside the Commodore, Secretary-Treasurer John Sears Wright. From the Atlantic Division, F. C. Moore, representing Vice-Commodore L. C. Kretzmer, Rear-Commodore W. A. Furman, D. B. Goodsell, representing Purser M. Ohlmeyer, Jr., and H. C. Allen, H. L. Quick, representing H. L. Pollard, and J. K. Hand, representing N. S. Hyatt, of the Executive Committee. R. J. Wilkin, of the Board of Governors, and its president, was present, as was H. L. Quick, of the Racing Board. From the Central Division, H. W. Breitenstein, Vice-Commodore, Charles P. Forbush, Rear-Commodore, Frank C. Demmler, Purser, and Messrs. Jesse J. Armstrong and John S. Wright, of the Executive Committee. Also C. F. Wolters, of the Board of Governors, and H. M. Stewart of the Racing Board. During the day the Central Division's Executive Committee elected Charles P. Forbush as its representative on the Board of Governors, vice C. F. Wolters, elected Commodore, and Frank D. Wood, of Buffalo, Rear-Commodore, vice Forbush; it also elected Hiram C. Hoyt on the Executive Committee, vice Wright, elected Secretary-Treasurer.

From the Eastern Division—Rear-Commodore H. M. S. Aiken, Purser Edward B. Stearns, and B. F. Jacobs, Jr., W. W. Crosby and O. C. Cunningham, holding proxy of the Executive Committee; also Paul Butler, holding proxy, as well as member and Recorder of the Board of Governors, and member of the Racing Board.

From the Northern Division—A. G. Bowie, representing Vice-Commodore C. W. McLean, of Montreal, Rear-Commodore J. W. Sparrow, of Toronto; Geo. A. Wright, representing Purser J. V. Nutter, of Montreal, and Herb Begg, of Toronto, representing Harry Page, of the Executive Committee; also J. N. MacKendrick of the Board of Governors.

From the Western Division—W. C. Jupp, of Detroit, representing Vice-Commodore Burton D. Munhall, of Cleveland, and H. C. Morse, of Peoria, on the Board of Governors.

At a meeting of the Racing Board, which met to organize, there were present Messrs. Quick, Stewart, Butler, Begg, representing the Northern Division, and Morse, representing the Western Division. The Board organized

Firefly.

The championship in the 25ft. class of the Yacht Racing Association of Long Island Sound was won this season by the sloop Firefly. A picture of the boat appears in this issue. Out of 15 starts during the season of 1903 she got 9 first, 3 second, 2 third, and 1 fourth prize. Firefly was designed by Mr. W. Starling Burgess and built by David Fenton at Manchester, Mass., in 1902. Her sails were made by Messrs. Consens and Pratt. Firefly is 36.7ft. over all, 21ft. waterline, 9.3ft. breadth and 4.3ft. draft. She has an exceptional amount of room, and every convenience for cruising. Having a very moderate sail plain she shows up to best advantage in fresh and strong breezes. Firefly was sailed in every race this season by her owner, Mr. G. P. Granbery, a member of the New Rochelle Y. C.

Constance—Auxiliary Schooner.

Last week we published the lines, sail plan and a photograph of the auxiliary schooner Constance, together with a complete description of the boat. This week there appear the cabin, construction and deck plans.

with H. Lansing Quick as president and H. M. Stewart as recorder.

The Board of Governors also met, with R. J. Wilkin, President; Paul Butler, Recorder; Wolters (and Forbush later) from the Central Division, MacKendrick, from the Northern Division, and Morse from the Western Division.

Complete audited reports were read and accepted from the outgoing pursers of the five divisions—a matter for pride and congratulation on the part of the Executive Committee. Reports were also read from the Board of Governors, the outgoing Regatta Committee, and the Camp-site Committee.

Mrs. Fred. W. Donnelly, of Trenton, N. J.; Mrs. John E. Plummer, of Brooklyn, N. Y., and Mrs. and Miss Armstrong of Rome N. Y., were elected to associate membership. A committee of three, to be named by the commodore, was authorized to revise the existing associate membership.

It was unanimously decided to hold the next camp—the twenty-fifth in the history of the Association—at its home, Sugar Island, in the St. Lawrence River, from August 5 to August 19, 1904.

The "Squaw-Point Flag" was, by vote of the committee, made official, to be hereafter one of the several burgees of the A. C. A. and its officers.

The Committee on Revision of the Constitution and By-Laws reported through its chairman that it was not ready to submit the revision for adoption, and asked for more time in which to prepare the amendments, which it hoped to be able to submit for final approval by the Executive Committee not later than January 1, 1904. The extra time was, accordingly, granted.

A number of recommendations made by the Regatta Committee were referred to the Racing Board for consideration. No questions pertaining to sailing or paddling regulations were considered; all such questions being laid over for the Racing Board's action.

A vote of thanks was given retiring Secretary-Treasurer H. Lansing Quick for the very able and efficient manner in which he had discharged the duties of his office, subsequent to the death of Mr. Simpson.

Mr. Begg, on behalf of the Northern Division, made a report on that division's condition, its growth in membership, finances, etc., at the present time, which was of a most gratifying character, and of great interest to the committee. (A synopsis of this report will be published later.)

The Camp-site Committee in its report showed permanent improvements made at Sugar Island last summer which form an asset of the Association, including the dock, camp-store, mess floor and kitchen, ice-house, pump, piping, etc., and aggregating in all, allowing 10 per cent. for depreciation, over \$600. The chairman of that committee also reported very welcome subscriptions to the permanent improvement fund from members of the A. C. A., many of whom had not even attended the camp. When they do so they will feel more than repaid for any expenditures they have made.

FOREST AND STREAM was indorsed as one of the official organs of the Association for the coming year, and it behooves every member of every division to support the official organs by news or races, cruises and camps, and maps, photos, and general canoeing news.

It was recommended to the officers and Board of Governors to take whatever steps might be necessary to copyright the letters "A. C. A." as a title of the Association—now in use for over twenty years.

A number of other matters pertaining to the Association and its island were discussed, and sundry questions brought to a vote, and passed. It seemed to be the general opinion that never had the Association been in better condition, and the utmost enthusiasm was expressed by the members present, over the camp prospects for 1904.

At the close of the business session, during a recess, of which luncheon was served in the lower floor of the hospitable Rochester Canoe Club House, to the visiting delegates, launches and canoes were brought into requisition to carry the members of the R. C. C. and the guests of that club and the Irondequoit C. C., to the latter's new club house, across the bay, where dinner was served at 7 o'clock. The entire lower floor was given over for the banquet, and was beautifully decorated with flags, autumn leaves and flowers, with innumerable lanterns, enhancing the effect. Commodore Wolters presided, aided by his affable secretary-treasurer, Jack Wright. During the dinner Captain Willard Rich, of the R. C. C., presented the commodore with an official cap, with the A. C. A. insignia, on behalf of the club, while Mr. Freeland, of the I. C. C., did the same, on behalf of his club, to Mr. Wright. A number of guests from the Buffalo C. C. and other canoe clubs in the vicinity of Rochester—the Sa-wen-nis-hat, Genesee, etc., were also present. The ex-chairman of the Regatta Committee presented four special shields, of the pattern offered as prizes at Sugar Island last summer, to ex-Commodores Edwards, No. 3; Gardner, No. 5; J. N. MacKendrick, No. 663, and Thord, No. 2987, for their valiant record in the single-blade club-fours' race last August; he added that he thought it wise to bestow prizes whenever it tended to encourage the novices, and bring out the younger element of the Association.

Other speeches, songs and music by an orchestra helped to make the time fly, and at the close of a delightful evening a number of the guests were escorted back to the Rochester C. C.; the remainder, stopping over night at the Irondequoit House. Sunday was given up to cruising and sailing around the nooks and corners of Irondequoit Bay—and the bay was in a blaze of glory with its rich autumnal tints—and partaking of a bountiful dinner at the Rochester C. C., and late in the afternoon the visitors were escorted up, to town, where the sights of Rochester were shown them from tally-hos, under the guidance of Jack Wright, at whose house the guests took supper, before leaving for their homes late that evening.

At the meeting of the Racing Board, lots were drawn for terms of office, as follows:

H. M. Stewart, Central Division, to retire 1904; Paul Butler, Eastern Division, to retire 1905; H. L. Quick, Atlantic Division, to retire 1905; E. J. Minnett, Northern Division, to retire 1906; ———, Western Division, to retire 1906.

Sugar Island Photos.

Photographs of Sugar Island Camp, August, 1903, by the official photographer, A. W. Scott, may be obtained from him at No. 5 West Thirty-first street, New York; prices, 5 by 7 inches, solio, 25 cents; velox, 30 cents; 4 by 5 inches, solio or velox, 15 cents each, mounted or unmounted. Quotations on large orders on application.

- 5 x 7.

In Memoriam.

To the Members of the American Canoe Association:
A sadder duty has seldom fallen to my lot than to chronicle the death of my dear friend, Mrs. Mary Virginia Hyatt, the wife of our Commodore of 1903, who passed from this life at Ossining, N. Y., on Monday, Oct. 12, 1903.

To all of you who met her at Sugar Island last summer, she was a friend; and won your affections by her charm of manner, her popularity and her devotion to her husband and children. To one who has known her as I have, since our childhood, the loss comes as hard as to anyone outside of her immediate family.

In the name of the men and women of the A. C. A., I have given our good friend, Nat, the sincere assurance of our grief and sympathy, and this sad hour, for himself, for her family, and—saddest of all—for her two little ones. She would always have been a welcome addition to the little coterie at Squaw Point, and I would have counted it my chiefest pleasure to have helped in her election to our roll of honor—the Association Membership List.

From her friend of many years, J. K. HAND.
BROOKLYN, N. Y., Oct. 28.

American Canoe Association.

Western Division officers, American Canoe Association, 1903-4:

Vice-Com., Burton D. Munhall, care of Brook's Household Art Co., Cleveland, O.; Rear-Com., Chas. J. Stedman, National Lafayette Bank, Cincinnati, O.; Purser, George A. Hall, Bank of Commerce, Cleveland, O.; Executive Committee, Thomas P. Eckert, 31 West Court street, Cincinnati, O.; Dr. H. L. Frost, 10 Howard street, Cleveland, O.; Board of Governors, Henry C. Morse, Peoria, Ill.; Racing Board (To be elected).

A. C. A. Membership.

Editor Forest and Stream:

I beg to inform you that the following were elected life members of the American Canoe Association:

No. 18, Dr. W. J. Nellis, Albany, N. Y. No. 19, Frederick B. Yard, Trenton, N. J. No. 20, Nathaniel S. Hyatt, Ossining, N. Y. No. 21, William R. Haviland, Yonkers, N. Y.

ROBERT J. WILKIN,
President Board of Governors.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

1904.
Jan. 12-15.—Hamilton, Ont., Gun Club tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

At the shoot of the Brooklyn Gun Club, Oct. 28, the prize in the

main event at 50 targets, distance handicap, was won by Mr. S. M. Van Allen, of Jamaica.

Mr. J. L. Winston, famous as a skillful trapshooter, has decided to domicile at West Baden, Ind., where he will establish permanent trapshooting grounds and a kennel of pointers and setters.

A distinguished group of sportsmen from Wilmington, Del., were visitors in New York last week. They were Messrs. A. Dupont, Herbert Taylor, J. Skelley, C. C. Gerow and Percy Smith.

In a match at 50 sparrows, 25yds. rise, 15yds. boundary, between Messrs. C. K. Knight, of Camden, N. J., and Fred Miller, at the Point Breeze race track, near Philadelphia, last week, each killed 29. In the shoot-off at 15 sparrows, the scores were: Knight 8, Miller 6.

In the final contest for the Crescent Athletic Club October cup, Oct. 31, at Bay Ridge, L. I., 25 targets per man, handicap allowance, Mr. W. W. Marshall and G. W. Hagedorn tied on 25. Mr. Marshall had the three best scores of the month's cup competition, and therefore was the winner and owner of it.

On Tuesday of this week Mr. T. W. Stake, of the firm of Messrs. Schoverling, Daly & Gales, and distinguished further in the trapshooting world as a skillful contestant in the amateur shoots of the Crescent Athletic Club, of which he is a long time member, sailed on the Kronprinz for Europe, where he will sojourn about five weeks.

In the five 20-sparrow events, 100 sparrows in all, at the shoot of the National Gun Club, West Baden, Ind., Oct. 26-31, Mr. Ed. Voris won. He and W. H. Heer tied on 90. In the shoot-off, 50 birds, Voris scored 45 to Heer's 43. The other leaders' scores were: Phellis 89, Elliott 87, Waters 83, Washburn and Marshall 82. Mr. J. M. Hughes won the cup race, 100 targets, by a score of 99 out of 100.

Mr. Edward Banks, secretary of the Wanderers, informs us that there will be six separate contests for the Smith gun, won and donated by Capt. Money, to the Wanderers as a prize. The contests will be held as follows, two on each of the following club grounds: Brooklyn, North River and South Side. The dates are Dec. 12, 19; Jan. 9, 16, 23, 30.

The regular weekly shoot of the Montclair Gun Club was held on their attractive grounds Saturday afternoon, Oct. 31. The attendance at these shoots and the high degree of interest manifested indicate a healthy future for this club; and a close observation distinctly shows that this shooters' school will graduate some fast ones. Messrs. Geo. F. Howard, Chas. L. Bush, Ed. Winslow, Geo. Batten, Chas. Boardman, H. F. Holloway, Mr. Cason, E. H. Holmes, Dr. H. W. Foster, P. H. Cockfair and I. Seymour Crane were present. Mr. T. E. Batten, of FOREST AND STREAM, was a guest of the club. Messrs. Howard, Bush, Winslow and Geo. Batten shot in fast form, the latter getting 5 pairs, assisted by the light of the moon. Mr. Holmes showed fast time, but was handicapped by using a brush gun.

BERNARD WATERS.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I., Oct. 28.—The prize shoot was at 50 targets, distance handicap, and the prize, a toilet set, was won by Mr. S. M. Van Allen, of Jamaica. Following are the scores:

Events:	1	2	3	4	5	6	7	8
Targets:	15	10	10	15	25	50	25	25
Goetter	9	7	9	8	..	36
Bergen	9	8	9	11	..	35	13	..
Dreyer	10	6	4	11	..	34	16	..
Hopkins	11	10	8	11	13	35	23	18
Caunitz	7	7	18	36	18	10
Van Allen	11	19	41	19	16

No. 6 was the prize shoot.

Fulton Gun Club.

Brooklyn, L. I., Oct. 25.—The scores made at the shoot of the Fulton Gun Club to-day are appended:

Events:	1	2	3	4	5	6	7
Targets:	15	15	15	15	15	25	25
Schorty	13	10	14	12	13	20	..
Goetter	9	9	14	7	..	18	..
Davis	7	11	10	7	9	14	..
Schneider	10	12	10	12	13
Moore	2	4	15

ALBERT A. SCHOVERLING, Sec'y.

Crescent Athletic Club.

Bay Ridge, L. I., Oct. 31.—The final contest for the October cup resulted in a tie between Messrs. George W. Hagedorn and W. W. Marshall, each with a score of 23. Mr. Marshall, having the three best scores of the month, was the absolute winner.

Final shoot, October cup, 25 targets, handicap allowance of misses added: W. W. Marshall (5) 23, G. W. Hagedorn (4) 22, Capt. A. W. Money (2) 20, T. W. Stake (5) 16.

Trophy shoot, 25 targets, handicap: W. W. Marshall (5) 25, W. H. Deghnee (8) 25, Capt. A. W. Money (2) 23, T. W. Stake (5) 20, E. H. Lott (1) 20, H. B. Vanderveer (2) 19, D. V. B. Hegeman (4) 18, G. W. Hagedorn (4) 18.

Shoot-off, same conditions: Marshall 25, Deghnee 24.

Trophy shoot, 15 targets, handicap: H. B. Vanderveer (3) 15, Capt. A. W. Money (1) 15, Dr. J. J. Keyes (2) 14, W. W. Marshall (2) 14, H. C. Chapman (5) 12, O. C. Grinnell, Jr. (3) 10, G. W. Hagedorn (2) 9, H. L. Meyers (5) 9.

First shoot-off: Vanderveer 15, Money 15.

Final shoot-off: Money 13, Vanderveer 15.

Trophy shoot, 15 targets, handicap: Dr. J. J. Keyes (2) 15, Capt. A. W. Money (1) 15, W. W. Marshall (2) 14, G. W. Hagedorn (2) 13, E. H. Lott (0) 13, O. C. Grinnell, Jr. (3) 10, D. V. B. Hegeman (3) 9, H. L. Meyers (5) 7.

First shoot-off: Dr. J. J. Keyes 15, Capt. Money 15.

Final shoot-off: Dr. Keyes 14, Capt. Money 13.

Yeast—And you say he is kind to animals?
Crimsonbeak—Yes; why, whenever his wife commences to sing he always puts the dog out of the room.—Yonkers Statesman.

Mother—How often have I told you, Tommy, that you should never let the sun go down on your anger?

Tommy—I can't help it, mother; I ain't no Joshua.—Yonkers Herald.

Some Experiments with Shot.

FINALITY in shotgun experiments is not readily attainable by reason of the large number of complicating factors that affect the results obtained. In laying down a programme of experiments there is a great temptation to multiply unduly the number of shots to be fired. The effect of such a procedure is that a subsequent review of the records obtained either involves the quotation of an unwieldy mass of figures or else much of the information obtained is lost through the necessity to summarize the results, whereby many important details disappear. On the present occasion the number of rounds fired were limited to fifty, this being thought sufficient to allow of every attention being paid to details as well as to the general principles evolved.

As our usual reports on the behavior of cartridges are based on what we call our proof barrel results, we proceeded to fire a number of shots, following the everyday routine. In this way twenty-five rounds were expended, these being divided into five groups, each group consisting of five individual shots. The average behavior of each size of chilled shot was thus determined, the records obtained comprising at lin. and 6in., time from fall of hammer to departure of shot from muzzle, and mean velocity over a 20yds. range. The following were the results obtained:

PROOF BARREL RESULTS.

1½ ounces of No. 7 shot, 383 pellets.

	Pressure in tons per square inch.		Time up barrel. Seconds.	Velocity over 20yds. in feet per Second.
	At lin.	At 6in.		
1.....	3.09	1.74	.0042	1019
2.....	3.06	1.95	.0044	1017
3.....	3.03	1.74	.0051	1017
4.....	2.87	1.74	.0038	1012
5.....	3.43	1.83	.0040	1028
Av.....	3.10	1.80	.0043	1019

1½oz. No. 6 shot, 304 pellets.

1.....	2.84	1.83	.0034	1002
2.....	3.22	1.95	.0036	1041
3.....	3.20	1.89	.0036	1022
4.....	2.81	1.74	.0051	1017
5.....	3.20	1.74	.0046	1024
Av.....	3.05	1.85	.0041	1021

1½oz. No. 5 shot, 245 pellets.

1.....	2.67	1.74	.0051	1048
2.....	3.43	1.74	.0047	1031
3.....	2.92	1.83	.0046	1048
4.....	2.90	1.89	.0053	1058
5.....	2.98	1.74	.0042	1031
Av.....	2.98	1.79	.0048	1043

1½oz. No. 4 shot, 194 pellets.

1.....	2.87	1.74	.0042	1051
2.....	3.03	1.74	.0044	1051
3.....	3.46	1.74	.0042	1031
4.....	2.73	1.74	.0046	1053
5.....	2.81	1.74	.0044	1038
Av.....	2.98	1.74	.0044	1045

1½oz. No. 3 shot, 158 pellets.

1.....	2.98	1.74	.0039	1046
2.....	2.75	1.74	.0051	1069
3.....	2.87	1.74	.0044	1075
4.....	3.35	1.74	.0049	1070
5.....	2.92	1.74	.0036	1030
Av.....	2.97	1.74	.0044	1058

The most striking fact of the whole table of experiments is the remarkable conformity one with another of the individual records in each series, the mean deviation from the average worked out being most insignificant. At any rate, it is fairly obvious that the average values obtained from each of the five groups of shots may be accepted as typical of the conditions that prevailed. In order, however, to have an additional check upon our readings of velocity, we fired a further twenty-five cartridges from a shoulder gun. The results obtained therewith were as follows:

VELOCITIES IN FEET PER SECOND OBTAINED OVER 20 YARDS FROM CHOKE BARREL OF SHOULDER GUN.

	Size of Shot in Cartridges.			
	7	6	5	4
1.....	1052	1048	1026	1052
2.....	1028	1058	1046	1058
3.....	1054	1028	1050	1036
4.....	1050	1050	1051	1028
5.....	1050	1034	1043	1024
Av.....	1049	1044	1043	1046

Attention may again be called to the extreme regularity of the velocities registered, the averages once more representing, not the mean of extremes, but the characteristic action of each five cartridges tried. So as to facilitate a general examination of the results obtained from the whole series of fifty shots, we have summarized the various averages in the following table:

SUMMARY OF RESULTS WITH CARTRIDGES CONTAINING DIFFERENT SIZES OF SHOT.

Cartridges loaded with	Pressure in tons per square inch.		Velocity over 20yds. in feet per second.	
	At lin.	At 6in.	From Proof Barrel.	From Sh'der Gun.
No. 7 shot.....	3.10	1.80	1019	1019
No. 6 shot.....	3.05	1.85	1021	1049
No. 5 shot.....	2.98	1.79	1043	1043
No. 4 shot.....	2.98	1.74	1045	1046
No. 3 shot.....	2.97	1.74	1058	1056

It is commonly recognized that the larger sizes of shot must necessarily have a superior striking power to that of the smaller sizes, and one would suppose that this superiority would at least be manifest to some extent when measuring the 20yds. velocity for such extreme sizes as 7 and 4. Yet the fact remains that while with our proof barrel sizes 6 and 7 show somewhat lower velocities than sizes 3, 4 and 5, on the other hand, with the shoulder gun the entire series of velocities seem to conform to a monotonous dead level. Examining the results obtained with shot sizes 6 and 7, it will be noticed that the pressures were greater than those obtained with the larger sizes. This may be accounted for by the fact that with small sizes of shot there are a greater number of surfaces of contact with the cartridge case. These and other conditions go to increase the amount of friction set up in the expulsion of the charge from the cartridge. The resistance being greater, the gas pressure is also more considerable. The increased rate of burning during the initial movement of the shot as a rule leads to a more complete combustion of the powder charge. This is shown by the increased pressure at the 6in. plug, the assumption being that powder which is not resolved into gas by the time the shot has reached this distance will pass out of the barrel in the form of unburnt residue.

While a limited number of experiments, like those under consideration, cannot be accepted as entirely conclusive, they may be none the less valuable as illustrating general principles. The principle here evolved is that, while small shot has a tendency to part rapidly with its velocity in passing down the range, this tendency is to some extent compensated for by the fact that the greater confinement in the cartridge leads to the production of a greater gas pressure, and therefore a greater initial velocity. With our proof barrel, which gives a pattern but little superior to

that of an ordinary cylinder gun, the net result of these two opposing influences seems to be that a loss of velocity over 20yds. was registered with 6 and 7 shot, but with sizes 4 and 5 the results were about alike, whereas with No. 3 shot a slight increase was manifest. Our shoulder gun, on the other hand, contains an exceedingly well-bored choke barrel. The closeness of flight of the column of shot, whereby it travels for a greater distance, as a compact body, would thus tend to minimize the effects of the varied driving power of the different sizes of pellet. At any rate, we have to face the fact that with a range of sizes of shot varying from No. 4 to 7 inclusive, the differences of velocity experienced were absolutely immaterial. With No. 3 shot an insignificant 10ft. of extra velocity was admittedly recorded; but even so, the firing results from the shoulder gun were such as to suggest that, whatever may have been the striking velocities of the different sizes of shot used, the measurement of mean velocity over 20yds. does not sufficiently indicate their relative differences.

Attention may be called, in passing, to the incidental advantage which this range thus affords for dealing with the general behavior of cartridges, the size of shot used not appearing to affect the characteristic 20yds. velocity shown by the powder. Furthermore, it is clear that the system of loading recently advocated in these columns adapts itself very well to the obtaining of standard results from a large variety of shot sizes. While, however, the 20yds. test of velocity is shown by these experiments to be a very useful means of judging the general behavior of a cartridge, it is not in itself sufficient to accentuate the distinctions that must necessarily exist between the action of one size of shot and another. We must, of course, assume that, even though the records of mean velocity up the range with the shoulder gun were practically uniform, the actual muzzle and striking velocity in each group of shots must have been markedly different, the small sizes of shot displaying a tendency to leave the muzzle at a high velocity and strike the target at a low velocity, whereas with the larger sizes, the muzzle velocity might be somewhat less and the striking velocity somewhat more.

This line of reasoning confirms the advisability of measuring actual muzzle and actual striking velocities when distinguishing between the behavior of different sizes of shot. Admittedly the average velocity over a considerable distance, such as 40yds., would bring into greater prominence the superior ranging power of the larger sizes of pellet; but the result would not be so satisfactory as if the velocity at each end of the range adopted were accurately observed. Further experiments should display in a more marked manner than at present the characteristics of the different sizes of shot which sportsmen favor according to their fancy or the results of their observation.—The Field, London.

IN NEW JERSEY.

Franklin Gun Club.

Franklin Furnace, N. J., Oct. 24.—Three events were shot, two at 15 and one at 10 targets. The scores in the events were: John Williams 10, 13, 7; Fred Suthard 8, 7; Ander Wright 8, 7, 8; Will Papé 8, 8; Frank Kishbaugh, 7, 7.

Pattensburg Gun Club.

Pattensburg, N. J., Oct. 24.—A very interesting shoot was held on our grounds to-day by some of our god reliable boys who always stick to the club and take interest in the shoots, with a good attendance from neighboring clubs and near-by towns, who took equal shares in the sport. The welcome visitors were from the following places: North Branch, Jersey City, Easton, Little York, Frenchtown and Bloomsbury. The main event was No. 5, for a hammerless gun. There were twelve entries. The result was three ties, and a shoot-off at 25 targets resulted in H. Heaney's favor by 2 targets. There was excellent nerve and courage in the shoot-off, and we must say we give all contestants credit for the good scores made under the unfavorable circumstances. The ties were shot off from three traps, known angles and known traps. It was almost too dark to see a target when thrown. The trade was represented by Mr. H. Overbaugh and E. G. Ritter.

Events:	Targets:

C. W. BONNELL, Sec'y.

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, Oct. 31.—The appended scores were made on our grounds to-day on the occasion of the seventh and last shoot of the last series, and closes the shooting on our grounds until next spring.

T. W. Eaton won Class A trophy on 23. No Class B men on the grounds. Class C was won by Chesterman on 18. In the cup shoot, which followed, Dr. Meek was high, on 23 out of 15 singles and 5 pairs.

The day was a fine one for trapshooting. Attendance only fair, only fourteen shooters showing up for the occasion:

Trophy shoot:

"Your Majesty," said the grand vizier over the telephone, "is it proper to say the Balkans is or the Balkans are?"
"I say," thundered the Sultan, "the Balkans be—"
The telephone clicked just then.

Fremont Gun Club.

FREMONT, Ind., Oct. 28.—The gun club tournament held here yesterday, the 27th, was well attended, and was a success. The day was bright, but a cold, northwest wind prevailed, making high scores difficult. The management had arranged so that all were cared for and made comfortable as possible.

Visitors and club members enjoyed the day. All were well pleased with this our first tournament.

The closing event of the day was the mercantile shoot. Prizes to the amount of about \$100 were shot for; 25 targets, 50 cents entrance, thirty-four participants. Handicap, \$4 added to each event; all were 10-target events; moneys divided 40, 30, 20 and 10:

Rifle Range and Gallery.

National Rifle Range.

THE following was recently published in the Duluth, Minn., Tribune:

Friends of the movement to establish a national rifle range in this city, most of whom are militiamen, have received information that a special committee appointed by the War Department has been instructed to visit the several available points throughout the country and select the most desirable one for the range. It is understood that the committee will act this fall. The military men regard this committee matter as important, as it shows the Department's attitude, they say, toward the great need of a fixed locality where the best volunteer militia talent in shooting can be encouraged and developed. The Duluth soldiers take it to mean that the range will be established in the West, since the East has an ideal one at Sea Girt, N. J. Another reason for thus believing is that the Western entries in the sharpshooting at Sea Girt have always been light, compared with those from the East, which is explained by the inaccessibility of the location to Western riflemen. The plan to run up an artificial sand peninsula at angles with Minnesota point about three miles southward has been urged by Duluth militiamen as being the best that could be offered by this city. Major Resche has taken a keen interest in the matter, and has been endeavoring to get it into presentable form for use in case the War Department committee visits Duluth on its inspection tour. He advances as reasons for urging Duluth's claims and the point location that the city is within easy reach of all the middle West. That the direction of the wind would always be known and therefore much better records could be made. Its absolute safety also would commend it, he says, to the public.

Presque Isle Rifle Club.

ERIE, Pa., Oct. 24.—To-day's shooting was as good as could be expected, considering the weather; it was clear, but cold. The attendance was small. Scores:

PUBLISHERS' DEPARTMENT.

The magnitude of a big theatrical enterprise like the seven theatres comprising F. F. Proctor's circuit, is well illustrated by some facts and figures connected with those prosperous and popular playhouses. In these seven theatres there are employed weekly nearly 150 stage hands, property men, scene painters, assistants, etc.; over 100 musicians; over 400 attendants "in front," such as officers, ushers, matrons, porters, cleaners, superintendents, ticket sellers, etc.; 30 local managers, assistant managers, press agents, typewriters, telephone clerks, etc., and about 300 actors, including the stock companies, vaudeville performers, etc. In all, nearly 1,000 wage earners draw weekly stipends from the Proctor treasury.

The offer to lease the hunting and fishing privileges on Mr. G. W. Vanderbilt's famous preserve, at Biltmore, N. C., is likely to prove of interest to many well-to-do sportsmen. These preserves offer trout fishing on about 3,000 miles of stream, and all the game native to North Carolina, besides the introduced wild boars. The region is elevated, and the preserve includes nearly 200 square miles of territory. In this great area are a number of houses, cabins and camps, and with the lease would go the use of the private depot at the so-called Pisgah Forest station, together with the services of the rangers, employed for the protection of the territory.

The new catalogue of the Ithaca Gun Company, of Ithaca, N. Y., is beautifully illustrated, and it abounds with pertinent information concerning their famous products. It contains a full list of prices, descriptions of the Ithaca guns in detail, and as a whole, testimonials from eminent sportsmen, and it is sent free to those who apply for it as per the address given above.

At Chattanooga, Sept. 16 to 19, Mr. W. H. Heer was high average. Mr. McDowell, an amateur, at Adair, Ia., Sept. 25, took high average, with 92 per cent. Col. J. T. Anthony, at Bristol, Tenn., Oct. 6, broke 159 out of 170, or 93½ per cent. At Prairie Grove, Ia., Mr. O. N. Ford, an amateur, broke 418 out of 445, 94 per cent. All used U. M. C. shells.

Messrs. Schoverling, Daly & Gales, of New York, were recently the recipients of a letter from F. Schorer, Galveston, Tex., in which he stated that two cans of green Walsrode powder, which passed through the great storm of 1900, were O.K., though the cans were rusted to pieces.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, NOVEMBER 14, 1903.

VOL. LXI.—No. 20.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

OUR CHRISTMAS NUMBER.

THE Christmas Number of the FOREST AND STREAM will be the regular issue of December 5. It will be enlarged and handsomely illustrated, and the cover will be printed in colors. The price will be 25 cents. Order from your newsdealer in advance.

The pictorial features of the Christmas FOREST AND STREAM will be of exceptional interest and value. The number will be among the handsomest publications of the season.

DOWN THE MISSISSIPPI.

WE shall begin in our issue of November 21 Raymond S. Spears' story of the expedition "Down the Mississippi" which he has undertaken at the instance of FOREST AND STREAM and for the benefit of its readers. Those who followed Mr. Spears in his "Walk Down South" require no assurance that in the new serial they have a rich treat in store. The chapters will be among the many good things to appear in the forthcoming issues of this journal.

BIRD COLLECTING PERMITS.

THE excellent bird protective law modeled by the A. O. U. Committee on Bird Protection has been adopted by a very large number of the States of the Union. The general excellence of this law is quite universally acknowledged. Enforced, it protects the birds, and its definition of orders, families, and so on, make quite clear what birds may, and what may not, be killed.

One of the provisions of the bill declares that any one who wishes to obtain a permit to collect non-game birds for scientific purposes, besides paying a fee for the permit, must furnish a bond to the amount of \$200.

The provision as to the bond was not hastily determined on, but was the result of careful thought. It was made a part of the bill by ornithologists, and of course not with any desire to work hardship to actual workers in that science. Its purpose was clearly to make the securing of a permit difficult and expensive for the multitude of young men and boys who fancy that they are ornithologists, but who in fact are merely collectors, who destroy birds and gather together their skins, much as other boys and men collect old postage stamps.

The destruction of birds by such collectors was very great, and it was proper that it should be stopped. The true ornithologist will kill what specimen he needs, and no more. He may be wholly trusted. He needs no permit. But a State official knowing nothing of birds or of ornithology cannot possibly distinguish the real ornithologist from the false, and cannot be expected to exercise discretion in the issue of permits. He must be bound by a statute.

For some time a feeling has existed among some ornithologists that the provision of the A. O. U. law which calls for a bond is a hardship to scientific men, and this sentiment is voiced in the September-October number of the Condor, in which the editor, Mr. Walter K. Fisher, urges that the bond provision be stricken from the law. It is urged that the various provisions which hedge about the issuing of the permit make it almost impossible in certain States to secure one. In New Jersey, for example, an overzealous game warden has declined to issue any permits, although the law provides for their issue. In Vermont only a very small number of permits may be issued in one year, while in Virginia there is no provision for granting a permit, and any one collecting there necessarily breaks the law.

Again, it is not pleasant to ask a friend or acquaintance to go on your bond, and the various guarantee and security companies charge from \$5 to \$10 for giving a bond. We learned recently of a case where it took six

weeks with an expenditure of \$8.50 to obtain a permit, and by the time it had been secured the man's opportunity for collecting was over.

Mr. Fisher's plea for the abolition of the bond provision of the A. O. U. law is a strong one, but there is much to be said on the other side.

It has been the experience of the A. O. U. Bird Protection Committee, when endeavoring to pass the model law, in any State where there has never been bird protection, that opposition has been made to the scientific collection clause. The ordinary citizen is unable to understand why he should be deprived of the privilege of shooting birds while it is granted to another person who also wishes to shoot birds—but for scientific purposes. It is the belief of that committee that unless the provision to grant a permit for scientific collecting is hedged about by special restrictions, there will be more cases like that of Virginia, where the permit provision will be omitted from the law.

There have in the past been many persons who collected birds for the purpose of selling the skins, or for purposes of barter and exchange. For these men severe restrictions are needed.

THE BLOOMING GROVE PARK CHARTER.

WHEN the topic of game preserves was under discussion in our columns recently, Mr. Charles Hallock contributed a note saying that the Blooming Grove Park Association had established pleasant relations with the dwellers of the vicinity of its preserve in Pike county, Pa., by giving them employment in various capacities on the preserve. It is well known that while this policy of peace and conciliation worked to the satisfaction of all concerned in the beginning, there subsequently developed much friction between the club and the people of the region; and the club sought to protect its privileges less by the promotion of good feeling and more by the application of the powers vested in it by the charter.

The charter was granted in 1871 to an association of sportsmen who set forth in their preamble that they desired to establish in Pike county, Pa., certain tracts of land as a park for preserving and propagating the different varieties of game animals, birds, and fish, both of Europe and America, and preventing their extinction, and to supply the same for propagation to different sections of our country. To accomplish this it was represented that for the full success of the enterprise the association should make and enforce its own game laws as to the time and manner of taking game and fish. One provision of the charter accordingly read: "It may make its own game laws through its board of directors, and may add to, repeal, or change the same from time to time." It was further empowered to select from among its game keepers special ones who should have the right and authority of deputy sheriff or constables, and it was made the duty of the sheriffs of Pike and Monroe counties to deputize these game keepers.

An elaborate system of penalties was provided for shooting or fishing or for simple trespass on the property of the association, the penalties for trespass running from \$10 to \$60 in the discretion of the magistrate, and from \$30 to \$60 for possession of fishing tackle or guns upon the property. For killing game and taking fish the penalties ran from \$40 to \$300, with imprisonment as an alternative in default of payment. And there were other provisions, looking to the severe punishment of trespassers by increasing the sums forfeited for the possession of game and fish. Added rigor was secured by a section which read:

The laws of the State relating to fish or wild animals shall not be applicable to any of the territory owned or hired by said corporation or over which it shall acquire the right to kill or take game or fish; except that any person not licensed or authorized by said corporation to take game or fish within the aforesaid boundaries, who shall take, shoot or hunt game, or catch fish within its boundaries, contrary to the game laws of this State, shall be liable to the penalties provided by said laws in addition to the penalties herein provided.

The opinion has more than once been expressed by lawyers that if the Blooming Grove Park charter should ever be taken into court it would be held to be unconstitutional. This has now been done.

In 1900 Charles Hazen, of Pike county, was arrested by one of the park constables and charged with having killed a deer on the Blooming Grove Park territory. He was summarily convicted by a magistrate under the provisions of the charter and was fined. In default of pay-

ment he was committed to jail, the right of trial by jury being denied him. Hazen appealed to the Court of Quarter Sessions, which held that his conviction was void, because the charter was unconstitutional. The opinion was written by Judge George S. Purdy. The association carried the case to the Superior Court, and Judge Purdy's decision was reversed. Then Hazen went to the Supreme Court, which, Justice Dean writing the decision, upholds Judge Purdy, and declares the conviction of Hazen illegal, and the association's charter null and void because unconstitutional.

THE REAL DOG DAYS.

THE real dog days of the year are the days of the open season, when the beautiful game birds and animals, so strong, so swift of flight, and so resourceful in strategy, may be taken into possession legally if the sportsman have the requisite skill to take them in a sportsmanlike manner at all.

This is the season when the hound, the setter or the pointer, is annually in the ascendant. Those dogs are now the stars of the hunting world.

In the minds of all true sportsmen, setters and pointers and hounds now hold exalted associations with the game birds and animals. From the shadowy nooks in man's memory they spring forth to the foremost places.

In this sportsmen's annual season every dog may have his day, and if he be a good dog, faithful, skillful and enduring, he may have a day or several days additional. Dog days, as a whole, are good days.

These are the days in which the hunting dog is pampered with the best of foods, the gentlest of caresses, the most affectionate of glances, the coziest of sleeping quarters. He holds now a constant exalted place in his master's conversations at home and abroad. So enthralling is the subject that it is almost as great a pleasure to listen as it is to talk. And note the capabilities to expand! The merits of the dog which at first required but one hour to recount, are elegantly elaborated by repetition till a half day or even a whole day is none too much time in which to present the favorite's past performances, wonderful intelligence, present abilities and princely ancestry. Hours are all too short when such useful information is so disinterestedly presented to the hearers. The dog, then, by virtue of his master's affection and attention, is brought out of the unmerited obscurity of months, a pleasure to his master and a blessing to his master's friends. The dog justly holds a leading place then in his master's affairs, and the master in turn takes a leading place in his friends' affairs, with the dog as a theme. This is the season when the dog enjoys truly great days.

Nor is the sudden spasm of appreciation confined wholly in application to the dog. The owners, too, who have spare dogs or spare guns, present or prospective, find themselves better remembered by sportsmen friends in the open season than in the close season, and thus benignantly participate in the revival. Such owners will frequently find themselves pleasantly removed from the obscure nooks of memory to the most forward and esteemed places of friendly attention, as is proper when one is the subject of purposes concerning guns and dogs loanable, or shooting invitations obtainable. Thus the opening of the shooting season restores many neglected dormant friendships which otherwise might be lost forever.

It is not entirely an untenable hypothesis that, on the one hand, as between the man who is unconsciously attentive with an ulterior friendly purpose to borrow a dog or gun, and, on the other, the man who is eagerly intent on decoying a friend into some verbal ambush in which he is forced to listen to a three-hour eulogy about the pointer or setter, Dash or Carlo, there is an equality of merit, all unappreciated by the unfortunate few who have not the enthusiasm of the true sportsman. In the sum total there is a certain equity established between the sportsmen of enthusiastic sentiment and the sportsmen of enthusiastic materialism.

And yet, when freed from the ego, which makes a dog better than all other dogs on earth because he is owned by the owner, a three-hour story may be of real interest to every one. But a story and a eulogy may be distinctly different in the matter of friendly or public interest.

And yet the real dog days for the dog are the days when the friends of his master are entertained with tales of him which never cease.

The Sportsman Tourist.

The Lodges of the Blackfeet.

MAN seems to be the only animal that is subject to the decrees of fashion. His clothing, his food, his furniture, and his dwelling change in appearance—if not from year to year, at least from decade to decade, or from century to century. Nor is this—as at first might be thought—a mere refinement of civilization. It is not only the fashionable man or woman, dwelling in cities, anxious to be up with the times and sensitive to criticism by fellow beings, that changes; primitive man also, though his fashions change more slowly, nevertheless alters the way in which he wears his hair, the appearance of his clothing, the shelters which protect him from the weather.

Among primitive man in America a form of dwelling long used is swiftly passing out of existence. The Indian lodge or teepee—the highest development of tent known to our aborigines—is disappearing, and for a very good reason. The lodge cannot be set up without a considerable number of lodge poles, and in these days lodge poles are hard to get. The lodge of ancient times, made from buffalo skins, and when the people were free to travel where they pleased over the prairie, was most useful, but now the buffalo skin is no longer to be had, canvas can only be bought for money, and in place of using the great amount of canvas needed for a lodge and sixteen or eighteen poles, the Indian is coming to live in a wall tent, which takes less canvas and far less weight of wood. Even among the least advanced tribes, therefore, the lodge is disappearing, and the wall tent is taking its place.

The old time skin lodges of the various prairie tribes have often been described, but the detail of the manufacture and much of the meaning of their ornamentation has never been printed, so far as I know. With the purpose of setting down some of these matters not generally known, I some time ago contributed to the American Anthropologist an article on the lodges of the Blackfeet. It is to the courtesy of Mr. F. W. Hodge, the Editor of that Journal, that I owe the permission to print here the same matter with some additions and with the illustrations used in the Anthropologist.

The old-time lodges of the Blackfeet were made always of an even number of skins—eight, twelve, fourteen, sixteen, twenty, and sometimes even thirty, thirty-two, thirty-four, or thirty-eight skins. The very large lodges were unusual. They commonly contained two or more fires, as described in my "Blackfoot Lodge Tales" (p. 187). Such a lodge was a load too heavy for one horse to carry; it was therefore in two pieces, pinned in the front in the usual way by skewers running from the top of the door up to the smoke-hole, and, in later times, buttoned up the back with the old Hudson Bay brass buttons. Probably at an earlier date the lodge was pinned together at the back as at the front.

Lodges were made in the spring or early summer, and for this purpose the hides of the buffalo cow only were used. A lodge in constant use did not commonly last more than a year. Holes were worn in it in packing: an ill-trimmed lodge-pole might wear other holes. The frequent wetting and drying of the sinew caused the seams to open, and while the woman resewed them and put patches over each hole that appeared in the covering, it was likely, when the heavy spring rains came on, to leak badly and so to be uncomfortable. When this point was reached, the woman began to think of making a new lodge, and notified her husband that skins were required for a new lodge-covering.

From the hides brought in by her husband, the woman carefully selected and laid aside those best adapted for a lodge-covering, and tanned them with special reference to the use to which they were to be put. She took pains also to save all the best sinews from the backs of the buffalo, taking off the straps in ribbons as long as possible—sometimes three or four feet in length.

When she had tanned the required number of skins, collected all the sinews needed, and prepared the necessary awls, the woman talked over the matter with her husband, and, having shown him that all was ready for the making of the lodge, he advised her to proceed. Meantime it was generally known through the camp that such and such a woman was preparing to make a new lodge. She now prepared a considerable supply of food, chief among which were kettles of boiled sarvis berries, and requested some old man to invite certain women to eat with her. The invitation was conveyed to the women early in the morning, and they were expected to come at once.

After the guests had come to the lodge and had eaten, the woman spoke to them, saying: "Friends, I am going to make a lodge. My skins and sinews and awls are ready, and now I wish for help to make the lodge." When they accepted the invitation, the women understood what it meant, and by accepting it they agreed to assist the lodge-maker. No direct reply to her speech, therefore, was needed or expected. After she had told them her wishes, she opened her bundles of sinews and distributed them among the women, each of whom carried a package away with her. It was the business of each to split the sinews she had taken to make thread for sewing the lodge-skins. The thread was made by splitting the sinew with the fingernail, wetting half the length of the strand in the mouth, twisting the end with the fingers so as to point it, and then, holding that end in the mouth, rolling the wet sinew between the palms of the hands for about half the length of the strand—sometimes two feet. The untwisted part was merely knotted at the end.

The next morning another group of women were invited to eat, as before. These were the sewers, and with them was called one known to be a good fashioner of lodges, who should be the cutter and designer. She carried the pattern of the lodge in her mind, and was guided only by her judgment. Like the thread-makers, these women came to the lodge in the early morning. After they had eaten, and the hostess had told them what she wished, the women began to rise and to leave the lodge. All around the border of the lodge, close up against the lining (and so immediately behind the people, who were sitting on the beds), were bundles of tanned skins—two or three tied up in a roll together. As the women went

out, one by one, each picked up one of these bundles and carried it out with her. At a short distance from the lodge they stopped, untied their rolls of skins and spread them on the ground together, edge to edge, so as to cover an irregular square, and then sat down about them in a circle. Then the old crier called out for the thread-makers to bring the thread, and soon the women to whom the sinews had been given were seen coming, each bringing her bundle of thread which she placed on the hides just within the circle of the women, so that a bundle lay before each one.

Now, the old woman to whom the designing was entrusted arranged the skins on the ground to the best advantage, cut off a piece here, another there, indicated where a gap should be filled up by a patch, and then set the sewers to work. Each had been provided with her awl and thread, and they worked fast. The designer superintended the making, seeing that the half-circle was true and of the right length, that the various tapers were properly drawn and were the same on each side, and that the ears and the front-pieces were properly put on. All the other women sewed under her direction, and obeyed whatever orders she gave. From time to time food was carried out to the sewers, who stopped to eat as they felt inclined. The sewing was usually finished in a day.

The string or strap at the top and back of the lodge, by which the lodge-covering was tied to the back pole, required special treatment. It is by means of this back pole that the covering is raised so as to go about the framework. It was important that this piece of leather

I.—THUNDER-BIRD LODGE.

should be sewed to the lodge-covering by a woman particularly chosen, for, if it were sewed by a woman of jealous or quarrelsome disposition, the lodge would always be smoky, whether or not there was wind. So a good-natured woman, one of cheerful disposition, was always chosen for the task of sewing on this piece.

When the women had finished sewing the lodge, they at once set it up and pinned down the sides close to the ground, put on a door, and closed the smoke-hole as nearly as possible. A fire was then started in it, and sagebrush thrown on the fire to make a thick smoke. This was done in order that the lodge-skins might be thoroughly smoked, so that they would never get hard when wet.

In putting up the lodge, the Blackfeet tie four poles together, and the remaining poles rest on the crotches of these four. The butts of the four tied poles are not set on the ground in a square with equal sides, but in a rectangle whose sides are longer than the front and back. The front of this rectangle faces east, while the back is to the west and the two long sides are on the north and the south. The remaining poles lean against the crotches of these four in a rough circle, much smaller than the circumference of the lodge is finally to be, and the lodge-covering is tied to the back pole, which is the last one put up. When the lodge-covering is put on, it is drawn about the frame until the borders meet in front of the lodge, and then a woman, mounting on a travois as a ladder, pins these borders together, using from fifteen to twenty-five slender skewers about the size and shape of the wooden skewers used by butchers. Other women now go inside and move the butts of the poles outward, so that the lodge shall be properly stretched. But the lodge may have to be used for some little time before it is thoroughly stretched and so tight that there is no danger of its leaking anywhere.

Often a new lodge-covering is put over poles that have been in use for years, but if new poles are to be made, these are chopped by the man and his wife on the edge of the mountains and brought into camp. A good-sized lodge requires twenty poles; a very large one, thirty. Obviously, the greater the number of the poles, the better a well-made lodge will be stretched, the tighter it will be, and the longer it will last. Some tribes use a greater number of poles than others, and those who use the most, commonly have the best lodges. When the new poles have been brought to camp, rough and with the bark and the stubs of the branches still on them, women are invited to eat stewed berries, and, after they have eaten, the hostess asks her guests to help her peel and trim the poles, and this work is commonly finished in one day.

If, for any reason, a lodge is persistently smoky, the Piegiens are likely to shoot a blunt-headed arrow up into the smoke-hole trying to hit the poles where they come together. This is supposed to remedy the trouble.

In old times the Piegiens, when camp was made, used often to spread a buffalo-robe over the diverging lodge-poles above the smoke-hole; it was tied to one, two, or three of the poles. This brought them good luck, so that

if enemies attacked the camp nobody would be hurt. It also made them light and active in their bodies, able to get about quickly, and to escape danger. It was an old custom, for which no reason can now be given.

The Piegiens know the lodges of the Crows at a distance, because of the shortness of the lodge-poles. This gives the lodge a "cut-off" appearance, quite different from the lodges of the Blackfeet, of which the poles extend from four to six feet above the top of the lodge.

Besides this, the wings of the Crow lodges have pockets into which the poles fit, whereas the Blackfeet wings have eyelets in the tips through which the poles pass, and often, if the poles which support the wings are slender, little twigs are lashed across them near the ends to prevent them from passing too far through the eyelet.

No lodge—at least no properly made lodge—is actually conical in shape. All are more nearly vertical at the back than at the front. The backs of the lodges of many mountain tribes seem very straight—almost at right angles to the ground—while the slope at the front is long and gentle. The difference has relation to the stability of the lodge. The lodge is always pitched back to windward, and the inclined poles in front resist the force of the wind, so that the lodge cannot be blown over.

At the last Medicine lodge of the Piegan Blackfeet, I learned the history of a few of the painted lodges. It is to be understood that the painting on each lodge is the special property of the lodge owner, and can be used only by him unless he sells his right to it to another individual, in which case the buyer has the sole right to the design and to any "medicine" or mysterious power which may accompany it. In a majority of cases the designs or the medicine which belongs to them, or both, have come to the original painter of the lodge through a dream, and where this is the case, it is commonly indicated by the butterfly (*a-pun-ni*) cross at the back of the lodge, immediately below the smoke-hole. I have already called attention to this sign and to its meaning.

Among the lodges seen that summer was one known as the Thunder-bird lodge, in the erection of which a special ceremony must be observed. The reason for setting it up on this occasion was that a certain young man believed that he detected in the sky the signs of a storm, and, filling the pipe, took it to Iron Pipe, the owner of the Thunder-bird lodge. The young man told Iron Pipe that he wished to have fine weather during the Medicine lodge, and offered him the pipe. Iron Pipe accepted it, smoked, and began to pray. The putting up of the Thunder-bird lodge, and the ceremonies which attend it, always cause a storm to cease if one has begun, and insure fair weather. Before it is put up a sweat-house must be built—the lodge-covering of the Thunder-bird lodge being used to cover the sweat-house—into which the lodge-owner goes, takes a sweat, and prays. After this he paints his forehead and the backs of his hands yellow, and a small blue spot on each temple. His women who erect the lodge can do the work only if painted with yellow paint on the forehead.

While the women were bringing the lodge-covering from the sweat-house, where it had just been used, Iron Pipe himself was engaged in painting the back pole bright blue, and in tying a bunch of bells on the end of it. The lodge-covering doubled once was now placed on the ground just behind where the lodge was to stand; a lodge-pole was laid on it, and the distance measured from the base of the lodge-covering to the top of the smoke-hole. Another pole was measured along the other border of the lodge. After it had received its painting, the blue-painted back pole was not placed on the ground, but was rested on a tripod, the butt pointing toward the south and the raised point toward the north. The four poles, tied together at the points measured on two of them were set up as already described. But in this case, the tying not being altogether satisfactory, one of the younger women proposed that they should be taken down and a guy-rope attached to them.

"No," said another older woman, "now it is up, it cannot come down."

When the lodge had been erected, it was seen that it was blue in color—it being of canvas—darkest above and pale near the ground. It was supposed to have been all one shade of blue, which represents the sky. At the back of the lodge, low down toward the ground, was painted a yellow disk nearly two feet in diameter. The northern half of this disk was dotted with small blue spots which represent hail; the southern side was plain yellow, meaning rain. The idea is, that before the rain reaches the ground it has turned—on the northern half of the circle—into hail. Above the middle of the yellow disk was the Thunder-bird sketched in blue, with outspread wings and with a zigzag line—a lightning flash—running upward from its head (Fig. 1). A drum painted in a similar manner went with the lodge, and was hung on a tripod immediately behind it. No man on foot or on horseback, and no wagon may pass between the back of the lodge and the tripod on which the drum hangs. No noise must be made near the lodge, and the lodge owner would not consent to have his lodge photographed.

On this occasion, when the lodge had been erected, the threatening storm passed away and the weather became clear again.

GEORGE BIRD GRINNELL.

[TO BE CONTINUED.]

Death of Theodore M. Schlick.

THEODORE M. SCHLICK, whose illness has been a matter of concern to his many friends for several months, died at his home on Leonard street last Saturday morning at ten o'clock, aged 38 years. Theodore Schlick was by trade a printer, and a most excellent one, too, but by nature he was a naturalist of the most pronounced type. The woods, the fields, the glens, the streams, were as an open book to him, and to stroll forth among them was his greatest delight. Every bird note was as familiar to him as the voice of a friend, and no little wayside plant was too humble or obscure for him to name. To ramble with him was a revelation; like Thoreau, he knew instinctively where to look for the hidden in nature, and to hear him discuss the beauty of a wild flower or the note of a rare bird was something to remember. There are rare trees in this vicinity known only to him, that he visited periodically to note their growth, and hidden dells that sheltered rare plants that he would turn to as to old friends. The seasons were all delightful to him. In the

Natural History.

An Intelligent Cat.

CHARLESTOWN, N. H., Oct. 20.—*Editor Forest and Stream:* I inclose you a cutting from the Manchester Mirror which may interest some of your readers who are studying animal intelligence, if you can find space for it. Some time since a correspondent, whose name I forget, gave us a "cat story," and promised more, for which I have been watching your columns, as I am now somewhat interested in "catology." I had the usual childish fondness for kittens when young myself, and this was somewhat revived forty years ago by that of my own children, one of whom had, I remember, a black kitten which he, for some forgotten reason, called his "Sunday cat."

My own tastes, as usual, were soon directed to horses and dogs, but an accident, while raising troops in 1861, disabled me forever for my favorite exercise in the saddle, and the wandering life of an engineer has prevented me from taking proper care of a dog, so that as I have quietly settled down in my armchair my attention has been accidentally drawn to cats.

It happened thus, two summers ago, when one of my little granddaughters was visiting me, a forlorn, half-starved yellow kitten wandered into the yard and appealed to her for comfort. She fed him, for which he seemed thankful, and he immediately attached himself to her, and took up his abode with us permanently.

He had evidently been some child's pet, although we never could find out where he came from, and soon made himself an important member of the family. He proved a good mouser, and paid close attention to the pantry and closets, and is a very clean and affectionate household pet. He is now a large cat, of a regular "lion tawny," with a white breast and white hind feet, and showing faint tiger markings of a darker buff, particularly in his tail and legs. The most remarkable thing about him is his fondness for a farinaceous or vegetable diet. He comes to my side at breakfast to beg for doughnut, which he eats most daintily from my fingers, and then goes over to Mrs. W. and finishes her saucer of oatmeal porridge for her, after she is satisfied. He likes Boston brown bread and baked beans, string beans from the garden, and is extravagantly fond of sweet corn, which he takes from my fingers, a kernel at a time; and after we have cut off the corn in the usual way, he will polish off all the cobs, steadying them with his paws while he licks them clean! He will not sleep in the house if he can help it, but prefers the barn, in which my landlord keeps two or three horses, and to which, I suppose, mice are attracted by the grain, as we sometimes see him playing with a mouse in the yard. One of the bitter nights last winter my daughter fixed a bed for him with a piece of old carpet in a basket, which he slept in one night, but the second night he got up, went upstairs to her bedroom, waked her up, and got her to come down and let him out, when he trotted off to the barn very happily.

He early showed a great friendship for me, and will lie on my knees by the hour, curling himself up into a ball, with both fore paws round my wrist, and his head buried in the palm of my hand, sometimes waking and challenging me to a frolic, by making believe to bite my fingers, and kicking my arm with his hind paws, while he holds the hand fast with his fore ones, and looking up at me in the most comical way. Altogether, he is quite a study, and his tastes for a vegetable diet are certainly not ordinary "cat instinct," though, as I have previously said, I do not believe in any line of demarcation from reason.

VON W.

From the Manchester Mirror.

"Mister McKinley" is a tiger-striped maltese cat who holds a place of honor in the household of Mr. and Mrs. Frank A. P. Mace, of George street, West Manchester, and every one who has seen him agrees that he is one of the most remarkable cats in New Hampshire. He descended from an ordinary breed of house cats, but he has grown to phenomenal proportions, and to-day he tips the scales at twenty-six pounds. That is about four times the weight of an ordinary cat. People who have caught a glimpse of him in passing the house have often called to ask for a closer inspection, and many people who have heard of the remarkable feline have gone to the Mace home to see him. And every one has said they never saw or imagined his like before.

Mister is seven years old. Mr. Mace made a pet of him from the first, and he is well trained in a variety of tricks. He is as intelligent as he is large, and the family tell of numerous experiences that prove his cleverness. He seems to understand a great deal of what is said in his hearing, and Mrs. Mace tells of one trick that illustrated his faculty of understanding in an interesting way. The cat used to show a great fondness for lying on a certain bed in a chamber of the house, and gave Mrs. Mace considerable annoyance by spoiling the white spread. She allowed him to lie on the quilt beneath, but punished him several times for lying on the spread, and either from her words or actions Mister apparently discovered just what she objected to.

"It was a few days after I whipped him for lying on the spread," says Mrs. Mace, "when I chanced to go upstairs and found him lying on one corner of the bed. The spread was turned back from that particular corner and he was lying on the quilt. It was turned back so smoothly that I was sure some member of the family must have done it, but on questioning them I could find no one who had been in the chamber. Next day I found Mister lying in the same place with the spread turned back as before, and that time I was certain that the spread had been tucked down at every corner when he entered the room. We watched him then and discovered that it was Mister himself who turned back the spread. Just how he did it I can't say, as he would not do the trick while we were in sight. One day I fastened down the corners so that he could not move them and he succeeded in crawling in under the spread and was lying there hidden in the bed when I went in."

Mister will sit up on his haunches when directed, and

will hold out his paw to shake hands. When he wants to enter a room he will rise to his hind feet and rattle the door knob until admitted. Although he is so large that he looks clumsy, he is remarkably active and spry, and he is anything but lazy. Like most cats, he likes a daily nap, but he runs about a great deal more than ordinary cats of his age, and will come running when called as quickly as a kitten. He is a good hunter, too, and keeps the premises free of mice.

The big cat is very particular about his food. He lives entirely upon cooked meat and milk, and he will not touch raw meat. When he catches a rat or mouse, he will play with it for a time and leave it uneaten. He is fond of music, and it is a favorite trick of his to walk up and down the keys of the piano while he purrs loudly with pleasure at the sounds produced.

Timing the Flight of Birds.

In times past much speculation has been devoted to the speed at which birds fly, and very many estimates have been made on the subject, which, however, because they were only guesses, have really little value. However, the speed of homing pigeons has been fairly well ascertained in this country and in Europe, and the conclusions reached in Britain are that on a journey of twelve hours a bird may fly thirty-three miles per hour; on one of four hours, thirty-six miles per hour; of one hour, forty miles, of ten minutes forty-eight miles, and of one minute fifty-two miles an hour. The speed of a pintail duck, as quoted in American Duck Shooting from observations made on a moving train, the speed of which was known, has been shown to be at one time fifty-six miles an hour, and later much more rapid. Detailed observations on this subject are lacking in this country.

On the other hand, at a recent meeting of the Bradford, England, Scientific Association, Mr. Alfred Walker gave the results of his personal observations and timing on the flight of certain birds. He stated that wild whooper swans had been timed and found to flap their wings $3\frac{1}{2}$ strokes a second; starlings going to their roosting places were found to fly at the rate of forty to forty-five miles per hour. Swallows, on the other hand, which we imagine to fly with very great rapidity, really cover only from fifteen to twenty-five miles per hour. A wild duck for a short flight flew at the rate of thirty-six miles per hour.

There are few more difficult things to do than to accurately time a bird's flight, and we may fancy that it will be some time before definite and general results will be had on this subject.

Season Signs.

MORGANTOWN, W. Va., Oct. 30.—*Editor Forest and Stream:* The observations of Frank Heywood in the current number of FOREST AND STREAM concerning a long, cold winter, are worthy of more than passing notice. It has always been my habit to note the "signs" as each season comes and goes, especially if much in the woods. Besides those which have been mentioned, there is another which very forcibly indicates the coming of a hard winter. From what few forest trees can be seen surrounding town here, the leaves are evidently hanging on the timber unusually late this year, which indicates a hard winter.

A good barometer for an approaching winter in some of the Western States is the badger. If he does much digging late in the fall, it is safe to predict a hard winter. In fact, the actions of many of nature's wild creatures are full of information, if one will only observe them, and it will be noted that it is always the man who is most isolated from his fellow men and all the sources of information attendant upon civilized surroundings, who observes most closely and gains the most knowledge directly from nature. Thus the Indians and the old time hunters, trappers and explorers, men of the woods, are much more wise in knowledge gained from personal observation than those who, living among men, depend upon others to observe for them.

EMERSON CARNEY.

As to Texas Reptiles.

In the Proceedings of the Academy of Natural Sciences of Philadelphia, Mr. Arthur Erwin Brown, Secretary of the Philadelphia Zoological Society, has recently published an interesting paper on "Texas Reptiles and their Faunal Relations."

The paper is divided into two parts, the first treating of the "Reptiles of Pecos," and the second of the "Faunal Relations of Texas Reptiles."

Pecos lies on the west bank of the Pecos River in a high dry plain much broken to the westward by irregular mountain ranges. The annual rainfall is only about fifteen inches, and the mean annual temperature about sixty degrees Fahrenheit. During the past four years Mr. Brown's collectors have sent to him from this region no less than forty-eight species and subspecies of living reptiles, almost all of them collected in the neighborhood of the town. As many of these are little known, Mr. Brown gives here an enumeration of these species, in which, as might be expected, the snakes are most numerous, and the turtles least so.

This material from Pecos has induced Mr. Brown to study the reptiles of the entire State of Texas, and this has led him to three conclusions, the first being that the boundary between the Austroriparian and Sonoran reptilian faunas lies approximately between the ninety-sixth and ninety-eighth meridians of longitude in Texas; second, that the restricted Texan district of Cope is not Austroriparian, but Sonoran; third, that transcontinental zones of distribution cannot be maintained for reptiles in the Medicolumbian region.

The Adirondack Elk.

MALONE, N. Y., Nov. 9.—Three elk from the herd recently liberated in the Adirondacks as a gift to the State by William C. Whitney were struck and killed by a light engine near Floodwood on the Mohawk and Malone Railroad. There were seven standing together on the track. One of those killed weighed over 600 pounds. The animals are very tame. Hunters near Floodwood last week were driven from the highway by this herd which persisted in keeping on the plank road through the woods, one bull in the bunch being very ugly.

coldest winter weather, with the snow knee deep, he would sally forth and tramp over his beloved runways, always bringing back a delightful account of what he saw. But in the springtime he was happiest. The first arbutus or hepatica was a pure delight to him, and the humming of the bees among the bursting buds was sweetest music. Mr. Schlick's literary attainments were of a high order. He had a faculty of putting down what he saw in a most charming style, and had he had leisure there is no question but that he would have made his mark in the field of nature literature. He was a great reader, but a most discriminating one; fiction he only indulged in lightly, but the works of John Burroughs, Thoreau, Rowland E. Robinson, Geo. Ellwanger and other writers on out of doors subjects were his constant companions. All through his illness he was able to read, and Ellwanger's "Pleasures of the Table" was about the last book he finished. FOREST AND STREAM was a weekly delight to him, and his pen has often graced the pages of that journal. During his illness he wrote a little series of "Wood Jottings" that appeared in FOREST AND STREAM of October 3, and not a day passed that he did not take notes of what he saw from his window or in his garden. —H. W. LeLong in Dansville, N. Y., Breeze, Nov. 3.

Tipping.

Editor Forest and Stream:

What fellows you editorial sharps are for hunting out bits of pepper likely to make a lot of us sneeze in chorus, though not necessarily in harmony! And now comes the "tip." Well I'll bugle a little—gently. (All things are comparative—even adverbs.)

To begin with, as Dickens said about old Marley and Scrooge, among all the insidious baits of the devil calculated to undermine the self-respecting manhood of a man, I know of none quite equal to the "tip." It is a trait of human nature, in the abstract, always to like to get something for nothing—to find unowned gold; to get some money and not have to work for it. Success therein is like opium-eating, breeding a craving for more and more, the element of uncertainty as to amount supplying the gambler's sauce. Yet, if there is one thing more certain than another, it is that you can hardly do a man more injury than to lead him to believe that he does not need to work for what he gets, and that he can shirk the duty he is paid to do with impunity. He may not be punished by man's laws, but there are others which he cannot dodge. Sooner or later he has to pay the score.

In mere dollars and cents, it is an injury to the man *en masse* to convince his employer that he can shirk his own duty and not pay living wages, but instead compel his employe to make it up by outside dividends. So long as the employer can get plenty of help on such terms there are plenty of employers who will continue so to do. And yet those same men are short-sighted in the matter to a marvelous degree. Why? Because they, too, have been bitten by the same venom, the same blinding desire to get something for nothing. But *are* they short-sighted? Well, let us see.

I have a friend in New York city who comes over now and then to the spectacled city on a visit. Invariably he hunts up Marston's restaurant for his meals, and, as one who has had long experience, he says that its like does not exist in all Manhattan large and several. But why? I will make no statements regarding the Manhattanese. I will confine myself to Marston. There you find these items: Low prices, good cooking, quiet serving, dainty dishing, spotless linen, swift and thoughtful attention. And from the steady growth of the establishment for lo! this many a year, and the countless throngs that go there, the owner must be a millionaire by this time. Yet, as far back as I can remember, the long bills of fare have borne prominently printed the legend to the effect, "We give our help sufficient wages. Do not tip the waiters, but please report promptly any case of inattention." And I have never heard of any such case being reported yet.

What would we think of a gun dealer who expected us to hand over to his clerk a dime or a quarter every time he put up for us a bag of loaded shells? Yet, where's the difference? Your English gamekeeper may have been an extreme case, but the principle of barefaced robbery is the same, and if that victimized Briton had done his own duty he would have landed that gamekeeper behind stone walls "for the rest of the season," and taught his own landed "friend" a much needed lesson. The chances are that his "friend" would at least have respected him thereafter, which, as it is, he probably does not do. No one, least of all a Briton, ever respects weakness and yielding to imposition. It is cowardly. Furthermore, it is utterly wrong as between man and man.

If I were to go into the woods to-day I should take with me a package of as good cigars and smoking tobacco as I could afford. Also a pipe or two, and, say, a flask of sherry. I do not smoke myself, and my use of sherry is somewhat limited, personally. I should endeavor to pick out for my guide a man—not a grafter—but an honest, self-respecting, congenial comrade. I should make my deal with him at the outset, and should expect to pay him a fair market price for his services, and for the knowledge which he has gained by time and experience. And that deal would cover the cash outlay to the last cent. But when the work of the day is over, comradeship begins. After an all-day paddle up stream through fog and rain, when the camp has been made snug and it is time to watch the glow of the fire and let every tired muscle relax in the warmth and blow, I should be thinking of many an unobtrusive bit of kindness done by that man beyond the fire. Things done from sheer comradeship between man and man, not nominated by the bond, and a something pleasant to remember him by hereafter. I might not be able to return that service to him in kind. Yet I might do something at that moment. And if he found my brand of tobacco more enjoyable than his own, nothing would just then give me greater pleasure than the thought that I had had sufficient forethought to bring a bit along, although no smoker, and that I could just then do an appreciated friendly turn.

But a "tip!" Sooner than that I would give him opium at once. Morally I believe it could hardly be worse.

And here, friend editor, perhaps you may find one more FOREST AND STREAM plank for your carpenter shop.

J. P. T.

The Linnaean Society of New York.

A REGULAR meeting of the Society will be held at the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evening, November 27, at 8 o'clock. The lecture will be by Geo. K. Cherrie. "Impressions of Bird Life in French Guiana." Illustrated by specimens.

WALTER W. GRANGER, Secretary.

Game Bag and Gun.

The Game Laws in Brief

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

American Game Birds.

IV.—The Snipe.

ACCORDING to the writings of ornithologists, the breeding grounds of the snipe begin on their southern boundary at about 42° of latitude, a parallel through the northern part of Nebraska, Iowa, etc. The grounds extend therefrom north to the Arctic Circle. The snipe migrate leisurely southward as the winter season approaches, tarrying on the available feeding grounds, ultimately going as far south as the West Indies and northern South America.

It is a bird of the wet lands, and, as mentioned concerning the woodcock, the available area affording its food supply is small as compared with the earth's surface. Relatively the places which are soft enough to be bored with its sensitive bill, which contain food to its liking and enough to supply its needs, are exceedingly limited in number and area.

Soft and wet land may also be gravelly, or sandy, or clayey, etc., therefore, unfit to sustain the animal and vegetable life on which the snipe subsists; or from its refractory nature it may be impervious to the delicate weapon with which nature has provided the snipe for the capturing of its food. It, therefore, is apparent that of all the wet lands, there are only certain parts which contain snipe food.

Of the places which afford snipe food, some are permanently good throughout the whole season, as, for instance, the sloughs and marshes and parts of river valleys of the prairie country wherein it makes its summer habitat. Other places are but temporarily available, as lands made soft and wet by heavy rains. Such places may serve it well for many weeks, as in Louisiana and Texas in the fall and winter months, during the rainy season, which in those States is largely the equivalent of winter. Again, the snipe may seek its food in places which are quite wet, as in some of the large wet marshes, and again in some other sections it may make its haunts on upland so firm that the hunter may walk thereon pleasantly and dry shod.

While the woodcock, its long-billed confrère, is a bird of the covert, the snipe is a bird of the open. On these birds nature lays a more severe restriction concerning a late stay in the North than she does on any other game bird, for a snipe or woodcock attempting to gain a subsistence in a frozen country is in a pathetic situation indeed.

Its food is said to be larvæ, tender roots of plants and worms, which it secures by boring, and also such insects and other similar edible food as it can secure on top of the ground.

To the local sportsman the snipe's habits in the shooting season—which is mostly the migratory season—seem erratic and unknowable, if its unstable characteristics may be called habits at all. It is in one place to-day, another place to-morrow. To-day there may be an abundance, to-morrow a dearth. Or it may go contrary to its erratic reputation and remain a number of days about the same grounds. Still, the shooter is largely in ignorance of what the snipe will do next. The weather and food conditions may be the same so far as observation can determine them, and yet the birds come and go in their own whimsical way regardless of conditions.

Apparently some mysterious impulse seems to impel the birds of a certain locality either to come or go, though not in the manner of birds which flock.

Snipe fly mostly in ones or twos or threes, sometimes more, but always in small numbers. Being independent in flight, it is difficult to understand how the common impulse to seek other grounds is at the same time felt and acted on by all the snipe of a certain neighborhood, or at least most of them. There are many exceptions as a matter of course, as for instance in a section where there are snipe in abundance on a certain day, a part only may leave at the same time. Indeed, a few snipe may be found on certain grounds

throughout the whole season. Yet, however much the exception may affect the rule, the greater part of the birds are erratic and lawless most of the time.

No doubt that which seems whimsical and mysterious in the life of the snipe is really in harmony with the needs of its nature. It being largely nocturnal in habit, is difficult to study. It is specially difficult for the resident of one locality to observe its general habits with any degree of precision. Seeing it in but one small corner of its habitat, the local sportsman can at best gain but a fragmentary knowledge of its needs and its habits.

Being swift of wing and enduring of flight, the snipe undoubtedly feeds over vast areas of grounds many miles apart, twenty or thirty miles of flight being of no more effort to it when in search of food than twenty or thirty rods are to the prairie chicken. When snipe invade feeding grounds in vast numbers, as is frequently the case, the grounds are soon thoroughly bored, and all the food within reach is consumed, thus it may be a necessity for them to seek food elsewhere till the exhausted grounds have time to replenish.

Many writers lay great stress on the difficulties of snipe shooting. They treat it as a bird of phenomenal swiftness and erratic flight, and the shooting of it as requiring something extraordinary in the matter of skill. As a matter of fact, snipe shooting at certain times is the easiest of shooting. On warm days, when the birds are fat and lazy, flying slowly and tamely, with pendulous bills, as is often the case in the fall in the South, no bird awing is more easily killed. They are then disinclined to fly. They indolently lie to the dog's points till the shooter walks them up.

The books teach that the snipe rises with a zigzag flight against the wind, darting to right and left with such rapid flashes of speed that the best of skillful sportsmen are puzzled, and consequently make many a miss.

The snipe, it is true, goes against the wind when there is a wind, and zigzags a few times to rise upward before taking a straight course. Many writers on snipe shooting lay it down as correct that the shooter, to take advantage of this peculiarity in rising, should walk down wind, or advance to the dog's point down wind, so that when the snipe is flushed it will fly toward him. All such teachings savor of the novice, or of a skill which needs nursing. All the difficulties are greatly exaggerated, zigzag, swift flight and all. The zigzag of the snipe awing is in the beginning of its flight, and nothing is easier than to wait a moment till it straightens out on a straight flight. Then the killing is a matter of shooting on the wing, similar to other wing shooting.

As to walking down wind to secure a better shot, the sportsman need not concern himself about it in the least, excepting perhaps on such days as are cold, and days when the birds are very wild and rise at the extreme range of the gun. As with pigeon shooting, the really good shot does not let his birds get hard if they rise within range. Whether they zigzag or not, he snaps them as soon as they are on the wing; or being well on the wing, he permits them to get into steady flight and then delivers his fire. There is on the part of the experienced shot no particular attempt to reach the bird from a weak quarter. He takes the shooting as it comes.

On windy days, or when the weather is cold, the snipe may be very wild and rise at extreme ranges. Shooting then is quite as much a test of the gun as it is a test of the shooter's skill. Few writers, however, pay any heed to the distinction, and consider it all, be the rise far or near, as a matter of skill alone. At best, walking down wind on snipe is an uncertain advantage, for they can fly down or across wind with a swiftness and ease which dispose very quickly of any trifling advantage of a few yards taken up wind for a start.

The habits of snipe, as oftenest described, are their habits when they are lean and wild, or wild from a change from warm to cold, or from calm to windy weather. But to teach that such is their regular manner of flight, would be on a par with teaching that quail live in the tree tops because they sometimes take refuge therein.

Even when lean and wild, on a calm day the snipe does not strain the skill of a good shot. But on a windy day it is a different proposition. The wild, lean snipe can dart very swiftly across or down wind, and if to this be added rises at long range, the shooting is then really difficult, though then, as mentioned before, it is also a test of the gun.

When wildest, the snipe is exceedingly restless and moves fitfully from place to place. It then takes alarm quickly, flying high out of range, with its bill extended straight ahead. It can pitch to the ground from its highest flight, darting downward with stiffened wings and lighting with the greatest ease.

In the course of migration the birds stop in favorite places where food is abundant, and oftentimes there remain till the weather becomes unpleasant. As a

rule, they arrive in the South in a lean condition. When lean they are also wilder, regardless of weather conditions.

Shooting them, if limited to times when they are wild, is shooting in its most difficult phases. But as mentioned before, such difficulties of snipe shooting are not the average of snipe shooting.

Snipe shooting as to possible quantity varies widely one locality with another. One locality may contain but a few snipe to reward the shooter's efforts, while in other nearby localities they may fairly swarm, as in parts of Louisiana and Texas in the fall and spring months, when the birds are migrating. In those States they generally remain several weeks to enjoy the food abundance. Some scattered ones in the South may be found all through the winter. The heavy rains of fall and spring, frequently a downpour of days in the far South, soften the fat alluvial prairie lands, thereby fitting hundreds of square miles for the snipe's habitat. In particularly favorable sections of the prairie, cotton, corn and sugar fields, they may at times be found in thousands. A dog in such shooting is an incumbrance except to act as a retriever. There is no woodcraft necessary in such shooting. The sportsman walks along till the birds are walked up. So rapidly will he sometimes flush them that, at every few steps, it is fire and load, and fire and load again. At such times the gun becomes too hot to hold, and the shooter must perforce stop till it is cool enough to handle.

Enormous bags of snipe have been made, particularly in Louisiana and Texas, where the greater part of the flight of North America congregates for a few weeks in the period of snipe migration. One of the greatest, and I believe that it is referred to now as the greatest bag, was made many years ago by Mr. Pringle, a wealthy sugar planter of Louisiana, who had great fame as a sportsman of rare skill. He bagged 400 and some odd snipe in one day. This is a large bag indeed. It is but one of thousands of large bags, but so common as to excite no special comment in that section.

I have told of these matters to shooters in the North whose success was measured by a dozen snipe, more or less, as the result of a day's shooting. Such large bags being outside of their personal experience, they have been pleased to consider it an idle tale. They seemed to think that their narrow experience in shooting a few birds over a few acres of ground each year, was the measure the world over.

In regard to the big bag made by Mr. Pringle, it may be added by way of explanation that he had negroes to assist him, some to carry the spare guns, others to carry the ammunition, and to retrieve the dead birds.

I have been told by men who have hunted with him that he is a most indefatigable walker, and possesses extraordinary quickness and accuracy in the use of the shotgun, snapping the birds almost on the instant that they take wing.

In that land of game abundance at that day, it was not considered unsportsmanlike to kill all that the sportsman pleased to kill, for, however great the bags, there was no apparent diminution in the numbers of the birds. If the sportsman killed many, their neighbors derived the benefit of it. The killing, too, was at irregular intervals, differing from the steady drain made on the bird supply day after day by those who shoot for market.

This circumstance of the record bag was a happening of many years ago, when the sentiment concerning game preservation was different everywhere North and South from what it is to-day.

As to snipe shooting and the way of it, the proper manner to shoot them is to go forth and shoot them—in other words, the set manner of doing this thing and that thing as taught by some writers is all very well if one can do no better.

There is no rule whereby snipe shooting can be made soft and easy, and there is no sportsman with proper ambition who will care to have his skill less than the best test that the bird can offer. If the sportsman's skill is unequal to the test, practice will improve it. In any event there is at least the pleasure of trying to cope with the conditions. The proper skill is that which takes the shooting as it comes, instead of picking out the easy shots, or easy combinations to secure them.

The best snipe gun is moderately choked or an improved cylinder bore. As in all open shooting, good work may be done with a full choke, since the shooter can pick his distance to shoot his birds. However, it is not every man who can wait on his bird, or who can estimate distances at a glance, therefore it is better to have a scatter gun which will be available for instant use when the bird rises. A 12-bore is most commonly used, and as for the size of shot, No. 8s or 9s or 10s are good, the latter being quite large enough when the birds are fat and lazy.

As a bird to shoot over dogs, the snipe is inferior.

Sometimes it is in such abundance that a dog is unnecessary. At other times it is so wild that it will not lie to the dog at all; if fat and tame, it may lie too well. Again, it will frequent marshes so wet, cold and rank with marsh grasses that it is impossible for a dog to work satisfactorily, however good his intention and ability may be.

Very few dogs have a natural fondness for work on snipe. It is acquired in most instances. Some dogs, good on upland game birds, thoroughly detest the snipe, and refuse to recognize it. On the other hand, some dogs like snipe as a bird to work on, though such are exceptional.

Considered strictly as a bird of the open, the snipe affords excellent open shooting. Yet there is never the weird uncertainty about it that some writers have discovered. No doubt an easy explanation of the difficult shooting is found in the manner in which the shooter handles his gun rather than in the manner of the snipe's flight.

When snipe are in great abundance, and can be bagged with little effort by walking them up, the sportsman soon tires of the sport. It is too easy then to be considered sport. On the other hand, when they are scarce, wild, and will not lie to a dog, it is too difficult and uncertain. The dog is eliminated then as a factor, and the shooting is largely a matter of taking chances. When the happy medium is found, the birds being neither too wild nor too tame, it is excellent sport indeed, though in Louisiana I noted that, where there were an abundance of both snipe and quail, the sportsmen quickly tired of snipe shooting and gave quail the preference.

B. WATERS.

A Profitable Buck.

A good story is told by a Utica physician, who is quite a hunter, concerning the novel scheme which an Adirondack guide devised for making money. It seems that the guide knew of a deer which came down to a certain lake to drink at about the same hour every evening. The animal had heard gun shots repeatedly, having been educated along this line to some extent by the woodsmen, who had taken great pains to see that it was not injured at all nor unduly frightened. Ordinarily the report of a rifle, unless it was quite close at hand, would not interest the deer at all and never was the animal sufficiently alarmed to prevent its showing up at about the same place on the lake shore almost as regularly as the sun went down. As soon as the guide had trained the deer up to the point where he wanted it and knew that he could depend upon seeing it every evening, he proceeded to say to his sportsmen friends and acquaintances that he would guarantee any man a good open shot at a deer almost any day in consideration of \$10. Most hunters have confidence in their ability to shoot well if they only have a good mark, and as a deer is easily worth \$10, the guide found many sportsmen who were glad to take up with his proposition.

The method adopted by the guide was to place the hunter, armed with a rifle, in the bow of his boat, while he would sit in the stern of the craft and propel it by means of a paddle. When they had sighted the deer and approached to within a reasonable shooting distance the guide would stop the boat and give the man in the bow a chance to do his part of the act. Invariably the hunter would raise his rifle to his shoulder, take deliberate aim at the deer and fire. At the crack of the rifle the animal would throw up its head, and almost simultaneously its heels and tail, and disappear from view in the shrubbery. Of course there would now and then be a hunter who would be quick enough to get in a second, or possibly a third shot, at the retreating form of the deer, but the game was never harmed, and the sportsmen had to settle.

Several hunters who considered themselves pretty sure shots when the conditions were right, accepted the guide's proposition and tried a shot at the deer, but were unsuccessful, and at length it came to a matter of wonderment in that region that no one, be he ever so expert with the rifle, could hit a deer when this guide took him out under the \$10 arrangement. Finally a reasonable solution of the problem came into the mind of a Utican who had heard many stories concerning the matter, and he determined to put his theory to a test. Accordingly, he made a bargain with the woodsman to the effect that in consideration of the usual \$10 the latter was to give him a fair shot at a deer on a certain day. The Utican did not put in an appearance at the lake where they were to meet and hunt until late in the afternoon on the day agreed upon, and when he did arrive he was in a great hurry to get into the boat and begin operations. He played his cards so well that they had been out on the lake for some time and had sighted the deer before the guide discovered that the hunter carried a shot gun instead of a rifle. The woodsman was inclined to protest against the use of buckshot, but the Utican insisted that a rifle was not specified in the terms of their agreement, and the guide at length reluctantly continued to propel the boat toward the game. When within a few rods of the quarry the Utican suddenly threw his gun to his shoulder, as he would in wing shooting, and fired, first one barrel and then the other, and as a result, he, of all the hunters who had taken up with the guide's offer, was the only one who succeeded in getting a deer to show for his \$10.

His explanation of the matter was that the woodsman, when he had run his boat up to within range of the deer, would check its progress, and the instant the hunter pulled the trigger of his rifle he would swerve the craft with a sweep of the paddle sufficiently to throw the sight off from the mark. So dextrous and

so cautious was the woodsman in executing this maneuver that none of the other hunters had detected the well-timed movement of the boat which occasioned the deviation of the rifle balls and the consequent loss of the deer and their money. The Utican, by using a shotgun and firing so quickly, did not afford the guide an opportunity to perform his customary feat with the paddle, and hence his success in bagging the game. It is believed, however, that the woodsman had previously reaped a rich harvest of \$10 notes from this particular deer, and by the time another season rolls around he may have another of the cervine animals equally well trained.

W. E. WOLCOTT.

A Day's Hunt in South Africa.

In my last letter was an account of shooting a cow elephant; and before I proceed to relate another day's sport, I must try and construct good cover to defend myself against any attack our good friend and correspondent Didymus may direct at big-game hunting on my part. For the front wall of the cover I may say the tusks were valuable (about \$125 the pair); for the side walls I may place the facts that the meat was a blessing to the natives and myself. I'll back well-cooked elephant foot against the best quail that ever laid on toast. For the back wall, the statement that a cow elephant with calf, in a country without large stones to dodge behind, is most dangerous. But for the shield from shots over the walls, I will have to place the real cover of all sportsmen, that it is our nature and we like it. We may build different walls from which to defend our sporting instincts, but our main cover will always be the same.

Now for the day's hunt. My thirty bearers were out of meat to eat, and to trade against meat or other provisions for the past week I had had little time for hunting and poor luck at these times. It was February, and a drizzling warm rain, and the grass over 6 feet high in the opens; but in the bush it was shorter and less thick, so at gray dawn I started with one "boy," again to try my luck. The majority of the game in the vicinity was water buck, and water buck like the bush in rainy weather, and choose low hills near the river by preference. My native had only his loin cloth and my extra rifle (Martini-Henry), and I was in my usual hunting and tramping togs. We were both soaking wet in two minutes. A northeast wind was rising, and we made for a low range to the northwest, thus having what on the rifle range is known as a 3 o'clock wind. On reaching the range, we beat to the west, and toward the river (Revue), above a bend, I had nearly passed over the range, when a water buck got up to my left and off at a great pace, being startled by getting our wind. Just as he was putting a rise between us, I got the sights on him and fired, and the welcome thud came back. On going to the spot where it had been, evidences of his being hit in the stomach were all about, blood, half digested grass, etc. As he had been going directly from us, it meant the bullet had gone between the hindlegs, and so might travel on to the lungs; but as it was a split bullet, this was hardly probable. The buck was badly wounded, and would doubtless make for the cover of the long reeds by the river bank, in which to die. I never take a cool and deliberate shot at a large buck with his back toward me, or, in fact, any shot, unless I can get a chance at the neck, shoulder or just behind it; not unless a buck is wounded do I shoot at it running. But this time I had pulled the trigger before reckoning up consequences. Now it is or should be part of every hunter's training never to let a badly wounded buck get clean away, if care and patience will secure it. The buck, as expected, made straight for the river, and on nearing the banks I located it as being on a small island of long reeds. My boy was directed to go down slowly and rout him out, while I stood in a commanding position on the bank to give him a finale. But my calculations were at fault. The buck was not on the island, but in the long reeds just at the water's edge of the mainland, and the island was not a small one, but a large one, of which only a fringe of reeds nearest the bank was visible. The buck got up nearly under the boy's feet, and giving a couple of snorts, crossed to the island and disappeared. At first I thought it had taken to the current to swim over, and I wondered, for the river was a perfect cataract, and broad and deep, very difficult to cross. However, I went to have a look at the "spoor" (almost any markings or traces are termed "spoor"; for instance, the footprints, the bent grass, blood droppings, resting place, etc., are all "spoor"). It was evident that the poor buck could hardly last the day. The spoor took us through the reeds and on to a large island with grass all eaten short by hippo; down this island to where it ended, and then into the river and down it. This continued for nearly half a mile, half-submerged reeds here and there showing a drop of blood. Then the buck had left the river and gone right up the bank and nearly past our camp, the blood flowing a little more freely by every extra strain. When the buck had got fairly on the high ground it first went up the wind, which had shifted to the east, and then tacked back and down. Then it commenced a series of tacks, zig-zagging down the wind, and stopping a few moments at each point. We followed this zigzag course for four or five turns, and found it useless; so I returned with the boy to where the trees were thick, and there we rested and ate maora fruit (a wild fruit not unlike the custard apple, and of excellent flavor). It was then 10 A. M., and we had sighted the buck at 5:20 or so.

After a full hour's wait we took up the spoor again. After a few more zigzags, the buck, finding he was not being followed, went directly down the wind to a small stream; then it went up the stream, and doubling back down in the stream again, then out on the bank (right) and back and up the stream bed to a small tributary coming in on the left bank; up this stream a little way and then out on its left bank, and keeping near the water going up the wind. Had it not been for the few drops of blood here and there we would surely have missed the spoor, for it had crossed and recrossed and even followed other spoor of water buck fresh that morning, and as it was raining all the foot marks soon were filled with water. Tracking was very slow work; still with us both and hard work, coupled with a fair experience, we were sure to find him lying down again. At last we came to where

the spoor went into the small stream; but it did not go out the other side, nor did it go back, and there were no marks leading up the stream bed. Just below was a fall of fully 12 feet, and the bottom of large, water-rounded rocks, a place apparently impossible for any buck to go down and not smash its legs. So we had another look on each side, and up the stream. Nothing there. Evidently it must have gone down this drop. Just at the edge there were slight marks that might be hoof marks. Luckily the wind had again shifted to the northeast, and so was not blowing down the stream, which was flowing nearly due west. Arrangements were again made; I to take up a position on the high ground to the east northeast and then the boy was to go down and frighten the buck out. Poor chap; he said he wished he had an asagai (spear) instead of the rifle. Just as I was getting into position, I heard more snorts and the crashing of bush as the buck came out. I had to run for my position, and getting on a low ant heap, saw him going along, but with only his horns and ears visible over the long grass. Soon, however, he stopped to look back and listen for the native who had disturbed him; and I, taking steady aim for where I supposed his neck was, let drive, and down the buck dropped, with a broken neck. I looked at my watch, and it was just 1:30 P. M.—a good eight hours after he had been mortally wounded.

The bullet had entered the belly low down and ripped up the stomach. The few drops of blood came from the first wound, the stomach having become swollen and the bleeding choked.

After putting some bushes over the carcass to keep away the vultures, we returned to camp, arriving there at a little after 2:30 P. M. I had a good bath, twenty minutes' sleep, and was ready for a good "breakfast." Most of the white people in the low country and all the natives have breakfast at about 11 A. M. and dinner at night, thus having two meals a day only. From after breakfast until 2 P. M. all offices, etc., are thus closed at the East Coast ports in the tropics of East Africa. On the veldt it is a good arrangement, for it gives time for a long early trek (tramp or journey), and time to prepare a meal and a rest in the heat of the day. The afternoon trek may start from 3 to 4, according to the heat, and go on to a good camping place about sundown. In this way from six to eight hours' traveling may be done easily, and from eight to ten if necessary.

The water buck is a fine antelope of the weight of a very large red deer or a small caribou. It is more like a large red deer than most of the African antelope. The horns are single (there are no branched horns on African buck), and peculiar in that they curve forward and not backward. Rings run round the horn from the base to near the tip. A good pair are about 27 inches long on the curve. Only the males are provided with horns. The hair on the throat is very long; there is a slight mane. The color is a uniform brownish gray, and with a peculiar white line making nearly a circle from the back just above the tail and one-half of it round each flank; the line is about one inch broad, and the first thing that strikes the eye if the animal is in a position to show it. A water buck standing among trees, and head on, is very difficult to catch sight of. These antelope run in troops of from five to fifty or more. The does are greatly more numerous than the rams—fully four to one. They do not pair, excepting a few weeks in September, and then only for a few days with each doe. The meat of full grown rams is very strong, and rarely eaten by Europeans when fresh. Young rams and does are passable if one is really hungry. Natives, however, like the meat. When the meat is made into beltong it loses all its rank flavor, and is as good as any. My friends have eaten it, and supposing it to be sable antelope beltong, praised it highly. Had they been told in the first place that it was water buck, it probably would not have been eaten. The hide is good, but the hair is stiff, and does not hold well. The water buck is so called because never found far from streams, rivers or large water.

SHUKALILA-A-GWANZA.

SOUTH AFRICA.

Quail in France.

QUAIL are deservedly among the most valued of the annual visitors of France. Natives of the southern shores of the Mediterranean, they leave their hot, sandy deserts to breed in a temperate climate, and reach this country in large flocks about the middle of April or the beginning of May. All through the spring the woods resound with their quaint little cry, in which the French peasant hears the words, *Paye tes dettes* ("Pay your debts"), and the English "Wet my feet." Laying from nine to fifteen eggs, they rear their families as far north as Britain, and then in the middle of August prepare to return once more, reaching France the second time at the opening of the shooting season. They travel now in immense flocks, the sky being darkened by clouds composed of tens of thousands of these little birds.

And these two regular yearly movements of the quail have given rise to an important industry in Europe. Every year, in the Grecian Archipelago, in Egypt and Morocco, fabulous numbers of the unfortunate little creatures are either knocked down with a stick and killed, or are taken alive and sent to the European markets, where their flesh is considered a great delicacy. The dead birds are plucked, cleaned and salted, and then packed in cases for export. The living birds are closely packed in curious flat cages made to exclude the light in order to prevent the birds from fighting, and are then shipped in cargoes of from 30,000 upward to the capitals of the Continent. The smell from these cages is incredible, and it is not surprising that the mortality among the birds on the journey is enormously high.

It is in the land of the Pharaohs that these massacres assume the largest proportions. As the season of the first migration of the quail approaches—that is, in the end of March—the Egyptian Government puts up at auction and sells to the highest bidders different positions on the route to be traversed by the birds. Here, before the return of the quail, little hutches are erected of about one foot in height, which are covered with the leaves of the date palms and contain each two entrances. On reaching the hot, burning sands of the Soudan the quail, now plump little balls of fat after their summer in the North, alight, weary with their long flight, and seek the

shade of the little green houses standing ready for their reception. In a single day a dealer will thus take as many as twenty thousand birds, and, as the traffic is carried on all along the shores of the Mediterranean for the whole period of migration, millions of quail are yearly captured alive.

In spite, however, of their astonishing fecundity, this wholesale slaughter of the birds began to produce an appreciable effect, and in France, as, indeed, in other countries of Central Europe, it was noticed that the flocks were rapidly decreasing in numbers. Unfortunately, too, the demand—in London, more particularly—for the delicacy is as great in the spring as in the autumn, although the bird is then thin and out of condition. In order to meet this demand the Minister of the Interior in 1878 authorized the import and sale of quail throughout the breeding season. This decision called forth an earnest protest from the farmers, who valued the birds highly on account of the quantity of weed seeds and noxious insects consumed by them, and from sportsmen, who foresaw a still greater diminution, if not indeed the utter extermination of the game. Their efforts were, however, fruitless, and the immediate result was merely a new development of the trade. To prepare the spring birds for the table a number of merchants in the neighborhood of Paris undertook to fatten them artificially, and, though the flesh after the process lacked the delicate flavor of the autumn birds, they at once began to figure largely in the menus of the fashionable hotels and restaurants of the capitals.

Meantime the numbers of the quail in the yearly migration became noticeably and steadily less, and societies for the protection of game insisted ever more loudly on the necessity of suppressing the spring trade, which, by preventing breeding, was doing incalculable harm. In 1892, accordingly, a fresh decree prohibited the sale and carriage through France of the Egyptian quail during the close season. It was found, however, that in spite of this step the birds became every year more scarce, and in 1899 the Minister of Agriculture, on whom had devolved the regulation of the game laws, prohibited the transport, carriage and sale of any kind of quail on French soil. As this, however, had naturally no effect on the steady demand for the bird in London, the decision of the minister had only the effect of diverting a very lucrative branch of railway traffic, and the London markets were henceforth supplied by way of Brindisi and Germany.

Bird lovers now opened negotiations with Germany with a view of closing her doors to quail, whether living or dead, in the breeding season. Realizing the importance of the step—for the quail had practically ceased to visit Central Europe by this time—an arrangement was concluded between the two countries, and both France and Germany refused to allow the bird dealers to transport these birds through their territory in the close season. This left only the way of Gibraltar open to London dealers, and the protracted journey added no less than 60 per cent. to the cost of carriage. In consequence of this increased expense the English trade has sensibly diminished.

These measures have been attended with so much success that the last two seasons have seen the return of the quail to France, and this year farmer, sportsman and epicure are alike rejoiced to find the birds so dear to them once more abounding in wood and moorland. The shooting season in Northern France opened this year on September 6, and the quail are unusually plentiful and strong in flight, and quail shot in France are now being sold at the Central Market, in Paris for 20 francs, or \$4, for ten birds—exactly the same price fetched for the ordinary French partridge.

Dr. Combes, Minister of the Interior and President of the Ministerial Council, is so encouraged by the result that he has induced M. Delcassé, Minister of Foreign Affairs, to enter into negotiations with the Governments of Great Britain, Germany, Austria-Hungary, Belgium, Holland and Switzerland for more strenuous international protection of the woodcock, already becoming exceedingly rare. It is even proposed totally to prohibit the shooting of woodcock for a period of three consecutive years.—Paris Correspondent New York Tribune.

Caribou.

ON Oct. 12 my friend, Dr. E. M. Schofield, and myself left Jamestown, N. Y., for a hunt in Newfoundland. We passed Vanceboro, the line between Maine and New Brunswick, on Wednesday morning, and from there on the country was new to us. We had expected as we went north to find it colder, and the season more advanced, but it was not; in fact, there had not been as much frost there as in New York State. A large portion of the country is well settled, and is a fine farming country, with good buildings, good roads, and all the evidences of prosperity. We crossed from New Brunswick into Nova Scotia, and stayed at Truro overnight. Truro is a good town with a bright, healthy look. Thursday we crossed to the Island of Cape Breton and reached North Sidney at night, where we took the steamer Bruce for Port-aux-Basques, Newfoundland, and arrived there soon after daylight Friday morning. Here we secured our licenses of Mark Pike, Esq., and took the Newfoundland Railroad. This is a narrow gauge road, but is equipped with sleeping and dining cars. We took our breakfast on the dining car, and a good breakfast it was. We were all day reaching Howley, our destination, where we were met by our guides, John Stroud and R. B. Stroud, his son, Charles Stroud, our cook, and Lige Sweetapple and James Arnold, packers. Saturday morning we started for camp, ten miles south of Howley, on Hinds Plains. On our way out we passed the camp of Mr. J. P. Howley, the Geological Surveyor of Newfoundland, whom we found to be a most pleasant and hospitable gentleman. From Mr. Howley's camp our way was mostly up hill and in places very steep, and we wondered how the packers could carry those heavy loads—but they did it without trouble.

Soon after leaving Howley we began to see caribou tracks, and just before reaching camp we saw two caribou. We reached camp at 2 P. M., where we found tents and everything in first class order for our com-

fort. Our camp was at an altitude of about 750 feet. At Howley there is a Government reservation extending five miles on each side of the railroad and for ten miles along the track. No one is allowed to kill caribou on this reservation.

On Oct. 21 our hunt commenced, and the first day my friend, the doctor, got a nice head of twenty-two points, and I one of twenty points, but much smaller than the doctor's. There were plenty passing south every day, but we wanted larger ones, and saw none to suit us until the 27th, when I got two fine ones out of the same herd—shooting them in a blinding snow-storm. The best one had thirty-six points. The following day the doctor got two magnificent heads in nearly the same place—killing both out of the same herd at 200 yards. These were large, massive heads with long beams and great spread, and were almost exactly alike. This finished our hunt, except that we had each secured two ptarmigans.

We broke camp and returned to Howley, reaching there on a Thursday at 2 P. M. We found caribou crossing the railroad in great numbers. From the time we reached there until dark, at least 200 caribou passed. The next day there were at least 300 more passed—all within sight from the depot. One herd of fifty or sixty swam the lake there, and it was a fine sight.

We returned by the same route, and certainly had one of the most delightful trips it was ever our privilege to enjoy. I wish to say that we were everywhere treated with the greatest courtesy. The railroad officials, the steamboat people, the customs officers and Mr. Pike, the Game Commissioner, all did their best to make it pleasant for us. As we were preparing to leave Howley, Mr. P. J. Howley made me a present of a caribou head ready for mounting, which I appreciated very much.

Of our guides I can hardly speak with praise enough. R. B. Stroud guided the doctor, so I did not come so much in contact with him, but he is a gentleman, and perfectly reliable and responsible in every way. My guide, John Stroud, sixty years old, is known from one end of the island to the other. He has never done anything in his life but hunt. He killed the meat for the men that built the Newfoundland Railroad, hunting both sides of the road clear across the island for 550 miles. He is one of the keenest sportsmen I ever knew; up early, always ready, never tired, quick of foot and quick of eye, with his hearty laugh and ready story, he certainly was "a boon companion well met."

Here's to my guide! His name's John Stroud,
A man among men of whom I feel proud;
His step it is quick; his eye it is bright;
No game gets away when once it's in sight.

Anyone contemplating a hunt in Newfoundland would certainly do well to correspond with John Stroud, of Alexander Bay, Newfoundland, or with his son, R. B. Stroud, of the same place. O. C. FRISBEE.

Scent.

It is not easy to find a subject pertaining to hunting which has not been discussed in FOREST AND STREAM, but I do not remember to have seen in print the interesting, if inelegant subject which Mr. Rodney West, an old Essex county hunter, treats of in the current issue of the Elizabethtown Post, and given below.

It is, of course, a well-known fact that there is a marked difference in the scent of individuals of the human family. I have heard of a deaf mute who could separate the soiled linen of a number of persons by the exercise of his highly developed sense of smell. Dogs follow their masters by their keen appreciation of their different odors. It does not, therefore, seem unreasonable to believe that some men are handicapped at the start as Mr. West asserts in their attempt to approach game, and the fact may serve to explain the perpetual bad luck of some hunters—though I have no doubt the hunters would prefer to believe it bad luck rather than bad smell.

While photographing deer for FOREST AND STREAM in Maine eight years ago, I was much impressed by the manifestation of terror observed in deer which had scented but not seen Jock Darling and myself. It suggested the human terror inspired by fear of ghosts and the supernatural. The deer that sees a hunter realizes its danger, but it is never as badly rattled as the deer that scents him. J. B. BURNHAM.

People wonder sometimes why it is difficult for one man to get within shot of large game, while another with less skill, less knowledge of the habits of the animals he hunts, and less care generally, seems to stumble right on to them, and become a successful hunter, without really knowing very much about the how. A specific odor escapes every person whether he knows it or not, and most any barber can tell you he never found two heads of hair (barring perfume) to smell alike. It is part of the individuality of the person, and, like him, differs from every other. His dog, his horse, and other animal pets and stock know it, and wild animals notice it also, in a curious way. They divide mankind itself into two classes, i. e., those whose perspiration is naturally of a sour odor when fresh, and those in whom it is sometimes of a heavy, sweetish smell. Sour-sweated people are generally not easily affected by the poison of ivy, but wild animals generally will more than avoid them when they can. There is something about that odor that they are "deathly afraid of," and the man thus constituted must be as cautious as an Indian, and must become a long-distance marksman if he would be a successful hunter, though the other sort have but little trouble in creeping on to game. I have known two men, one of each sort, to run on to a deer, the "sweet" man was in sight, while the sour was not. The deer gave one look at the man she saw, flitted her head and regarded him no further, while she was looking keenly, with every mark of fear, for the man she did not see but winded. She soon caught a glimpse of him through the leaves and brush, and then left in double quick time. This last was a man who felt his natural disability in this respect keenly, and had become a long distance marksman from

necessity, for he had a great fondness for the hunt, and with meat not shot with a "silver bullet," though he could handle poisonous plants without inconvenience.

Cleanliness as well as caution is a very good thing for a hunter to practice. A dirty man is easier "winded" by game than one who is clean, because his scent will be stronger. And the man who goes out hunting all perfumed, as if for the ball room, advertises himself to the game most effectively, and they consequently do all they can to keep out of his way, especially if he is sitting "on watch" or going down the wind. Scentlessness, cleanliness, coolness and caution are four good cartridges for every hunter to carry with him, unless, indeed, he gets enough of the scent of his game on him so that it will (like the rabbit killer in Australia, who gets to smell like his business), neutralize or cover his own personal odor. I have proved and seen others prove the truth of these things in many instances. I once knew a hunter to rub some perfumed vaseline on his gun to protect it from dampness. He went out hunting with it, and soon found that the deer could smell him long before they could see him or he see them, and he could hear them jump up and run off before he could get at all near. He went home disgusted, washed his gun clean of the objectionable odor, waited a day and tried it again. This time he was successful, but the experience of a few days before taught him a lesson he will not soon forget.

The Mt. Tom Reservation.

BOSTON, Nov. 7.—*Editor Forest and Stream:* Thomas Burney and another deputy had an exciting time this week in arresting two Italians for shooting robins. One of them drew a pistol and threatened to shoot the officer, who, however, overpowered and disarmed them, and Judge Berry, of Lynn, imposed a fine of \$50 upon each of them. "Tom" has been on the force ever since it was organized by Captain Collins, and the matter of looking into the muzzle of a loaded revolver doesn't jar his nerves in the least. Besides being a good officer, he is an all-round sportsman. He was one of the leaders in forming the Lynn Fish and Game Protective Association and has been its president.

Our South Shore gunners have been getting good bags of coot, ducks, yellow-legs, etc., of late, due largely to the storm. The season, they tell me, has been eccentric; with now and then a few good days followed by very poor ones.

There has been some Sunday gunning, which, it is reported, the local officers are determined to stop so far as Duxbury and Marshfield are concerned.

In my last letter I spoke of the Mt. Tom reservation as "provisional." The question of its establishment was settled in the affirmative by the voters of Hampshire and Hampden counties last Tuesday. The act of the Legislature last winter had a referendum giving the voters of the two counties the privilege of deciding the question. There was considerable opposition to the measure in Northampton on account of its effect in taking away some taxable property, but at the election the city gave a majority of 94 in favor. The total vote of the counties was 18,857 yes and 5,237 in the negative.

The care of the grounds rests with the commissioners of the two counties. For several winters past the question of the reservation had been agitated, and the friends of the measure have at last been rewarded with success. The legislators of Massachusetts are inclined to take broad and liberal views regarding these reservations, and where the local sentiment is strongly in favor, as it was shown to be, for the establishment of "Greylock" and "Wachusett," and now "Mt. Tom," they are not unwilling to appropriate the necessary funds.

A thousand pities that the brilliant leaders in New Hampshire politics did not take the initiative years ago in saving the forests of the White Mountains from destruction. Is it possible they were ignorant of the part those forests play in feeding the streams on which her great factories are built?

More likely their consciences were quieted by the power of the wealthy timber owners and the cry of extravagance always raised when an appropriation for such a purpose is asked for. But one State in New England is exempt from the benefits of the rivers that have their sources among those mountains. The people of the whole country are wont to make pilgrimages in order to feast their eyes upon the beautiful scenery, and not a few to take the trout from the pellucid waters, the grouse and deer from the covers. When stripped of the forests, when fire has laid its black hand on the soil, and grim desolation stares one in the face, who will care to gaze on the scene? The work of destruction is to-day going on apace! Hundreds of axmen are now doing their fiendish work on the Presidential range and elsewhere. Is it not a blot on the fair escutcheon of the Granite State? Generations may come and go, but the woods on those rocky slopes once destroyed will never appear again, or if they do it will be long after this generation, and probably the next have been "gathered to the fathers." A Federal park has been suggested as a means of salvation. Possibly some of your readers are familiar with the history of some of our national reservations and can tell how many years elapsed between the inception and the realization of them, or just how many years will pass before the Great Appalachian Park, which has been advocated already for some years, will become an established fact. I am compelled to believe that before the general Government shall have established a White Mountain park every tree that will pay for cutting and marketing will be converted into cash. Speedy action alone can save these forests.

Our friends in Vermont have succeeded in securing a good many deer the last ten days of October, and I hope to be able to give the number approximately in a few days. Several men have been arrested for shooting does, and all law-abiding citizens hope they will suffer proper punishment. Commissioner Thomas is following up several of these cases in court.

One 300-pound buck was shot in Montgomery, a fine 2-year-old in the vicinity of Essex, one in Belvidere, and several on the line of the narrow-gauge road running out of Brattleboro.

It is believed that a large number of does have been killed, some say a hundred or more, and the sportsmen in some localities think more restrictions are needed.

CENTRAL.

PRINCE'S BAY, N. Y., Nov. 5.—*Editor Forest and Stream:* The nail has been hit squarely on the head and sent home; it will hold for generations to come, and Mt. Tom will stand a monument to Christopher Clark for all time. The people of Massachusetts should thank those who were generous enough to say "yes" on election day. We will not hear any more about \$100,000 a year for those roads on Mt. Tom. I think it will be conceded by all that "beauty unadorned is adorned the most" in a case like this. Now let the people acquire enough more of the mountain to take in the old trout brook and put the beautiful lake in the same condition that it was about thirty years ago. But what has been done is a grand achievement. I do not wish to be harsh, but cannot help thinking it was a foolish opposition to oppose the benefits of future generations. ***

In Assiniboia.

From the Saginaw, Mich., News.

You ask me to write something in regard to our recent hunting trip in the northwest. Of course there is a good deal that could be written about a trip of this kind, but I have not time to more than give you an outline of what we saw and my impression of the country.

First, let me say, this was the twenty-first annual trip of the Saginaw crowd to the northwest. The first trip was taken in 1883 in our car City of Saginaw. This car was bought from a defunct circus, an old advertising car. Messrs. Wells, Stone, Jerome, Stevens, Rust and others purchased it, and rebuilt it for a hunting car, and it was used mainly, in those days, for deer shooting trips on the various branches or logging roads in northern Michigan. The old car finally outlived its usefulness, and the new car, W. B. Merston, was built in 1894, owned by ten sportsmen, mainly residents of Saginaw, though some were from out of town. The ownership has now narrowed down to nine, by reason of the death of one of the original owners, R. D. Schultz, of Zanesville, O.

The car and party left here on the morning of October 3, via the Straits of Mackinaw and the Soo line, stopping first at Portal, on the boundary line between North Dakota and Assiniboia territory. We had had reports of tremendous shooting in that district, but, like a good deal of railroad information, for the sake of getting sportsmen into their territory, Portal proved to be a disappointment. It is in the midst of the prairie wheat growing country. The country around and for many miles north and west of Portal, we were told by one of our party who had recently returned from Europe, resembled Siberia greatly.

Our first shooting ground was a lake fourteen miles from the railroad station, and we did find quite a number of ducks, but were literally devoured by mosquitoes. There was no other game in the vicinity, and as it was still early for wild goose shooting, the birds not having come down from the sub-Arctic regions, we concluded to put in the remainder of the week at Pleasant Lake, N. D. We found that the ducks that had been most plentiful earlier, had all gone south; in fact, common report in North Dakota was that there was a tremendous crop of ducks early, but the cold spell and snow storm the latter part of September had evidently driven them away. There were any quantity of prairie chicken around Pleasant Lake; sometimes we would see droves of 300 or 400 together, but they had packed for the winter, and were as wild as hawks, so we could only get an occasional one.

Sharp-tailed grouse and prairie chicken are protected in North Dakota, excepting from Sept. 1 to Oct. 15.

The last of the first week of our trip we pulled out for Moose Jaw, Assiniboia territory. This seemed like a long ways to go for shooting, but it is famed as the best wild goose country known. Being strangers, it took us a good while to get our bearings, and the weather being mild as midsummer and far warmer and pleasanter than it has been recently in Saginaw, did not make it ideal weather for goose shooting, and we found that we were still a little early, that birds had not begun their southern flight; yet we had fair sport, one day getting twenty geese and another sixteen.

We found it very hard work to get teams to transport us to and fro from the shooting ground, owing to their being engaged to parties looking at land. It is wonderful the number of people who are coming in there to take up farms, and the greater share of them, we found, were people from the United States; in fact, we could scarcely go anywhere without running across people from Saginaw or vicinity.

The Canadian northwest is a great grain raising country. I understand that in Assiniboia the average per acre of wheat, computed on a basis of the tilled soil for the season of 1902, was 27½ bushels. Wheat, of course, is the main product, but flax is usually the first crop sown on the sod, and is a fairly profitable one. Vegetables can also be raised. I never saw finer potatoes, which were selling at 75 cents per bushel, not only there but all through North Dakota. They also raise cabbage, beets, turnips, etc., but it is too far north for raising corn.

One of the drawbacks to Assiniboia is the lack of good water. There is any quantity of water, but mainly alkaline, so drinking water is generally at a premium. One is scarcely ever out of sight of a farm-house, but the houses are far apart, for the farmers believe in having lots of land, rarely anything less than a section, and sometimes two or three times this amount. We were told it was no uncommon thing to get crops of wheat running from 40 to 55 bushels to an acre.

We hunted about four days in the territory around Moose Jaw, and just as we were ready to leave, the southern flight of geese began, and could we have stayed the following week, we certainly would have had rare sport. In this locality prairie chicken or pinnated grouse was rarely seen, but the sharp-tailed grouse takes its place. It is a magnificent bird, and had not packed as badly as the prairie chicken had further south, and we had very good sport with this game, making no large bags, but it was no uncommon thing for a party of two

or three to get twenty of these birds in a day, and that all without dogs. The quantity of game we got was not much considering the time and the number in the party, and none of it was wasted, for each day we gave away all that we could not use ourselves, and the settlers or railroad men were always glad to get it. The last few days of our shooting we tried to save some to bring home for it is not contrary to the law of Assiniboia to bring out of the territory ducks or geese, but sharp-tailed grouse are prohibited.

The license fee in Assiniboia is \$15 for non-residents, and it is closely looked after, and I understand their game laws are well enforced. In North Dakota the non-resident license fee is \$25, and there is a non-export law, but I am sorry to say that about the only rigid enforcement of the game laws I noticed was the prompt collection of the license fee, which is divided mainly among the game wardens. About half of it goes to the district warden, for North Dakota is divided into two districts, with a chief warden in each, then the local game warden has a good big proportion of the balance, and a small fee goes to the county auditor. While the North Dakota law prohibits the killing in any one day by any one person of more than twenty-five of the game birds protected by law, very little attention is paid to this clause, the local game wardens themselves considering it a dead law, and boasting of some of the big bags. I believe, however, they look rigidly after the enforcement of the law as it relates to the exportation of game by market hunters, for I heard of instances of the seizure of grouse that had been taken to a creamery and packed in firkins and a layer of butter put over the birds and shipped out of the State as butter. I believe that a license law is beneficial, and tends to protect game, but I believe it would be more consistent and fair if non-resident sportsmen, after paying the license, were permitted to bring home a reasonable quantity of the game they kill. I believe such a law would be good here in Michigan. Minnesota game laws are better enforced; the State game warden is not afraid to work himself, and instead of enforcing the law through some office by typewriter he gets out and hustles himself. State Game Warden Fullerton, of Minnesota, only three weeks ago, made an important seizure. Five wagonloads of ducks shipped from Herron Lake were intended to cross the Iowa line, but they caught the outfit within ten miles of the line. It seems that a professional market man had been there and engaged hunters to shoot for him, and he was arranging to get them to market in some of the big cities when the game warden dropped on to the whole scheme.

To sum it all up, we found that prairie chicken and sharp-tailed grouse were far more plentiful in North Dakota this year than probably ever before; that the early crop of ducks was tremendous, but did not stay in the State long; that the wild geese are probably as plentiful now as they have been within the last twenty years, but owing to the wheat growing territory being so much greater than formerly, the birds are more scattered, and large flights not so centralized as when wheat was only grown along the Red River Valley. Now they are growing wheat north of Assiniboia territory in Saskatchewan, the whole northern country is to be crossed by new lines of railroads. We were told that more wheat is annually now received at Winnipeg than either at Duluth or Chicago, and one has but to take such a trip as we have just finished to be convinced that there is a mighty big country north of us that is capable of supplying wheat for the world.

At M——, North Dakota, it became noised through some source that our car contained a noted party, headed by Senator Hanna, and we had just gotten nicely packed in our beds when the local band struck up "Little Eva" alongside of us. One man held a kerosene lamp while the bass drum got in its work. We, of course, passed around cigars and the orator of the party appeared in pajamas on the rear platform and did the best he could to tell how much we appreciated the compliment. The paper the next day contained the names of the party, and from the list of Generals, Senators and Governors, we had considerable enjoyment trying to locate who was who. You can rest assured that the newspaper account was decidedly flattering to North Dakota and the people of M—— as well.

W. B. MERSTON.

The Maine Season.

BANGOR, MAINE, Nov. 7.—*Editor Forest and Stream:* The past week has not been an ideal one from the standpoint of the hunter, as almost no rain has fallen until the latter part of the week, and the dry leaves made still-hunting almost impossible, while the low state of the streams and rivers has made canoeing, except in the larger streams, very difficult, even impossible at times. As a consequence the shipments of game through Bangor have been, with the exception of Monday, very light. So the woods-bound course of travel has been light except for two days, when the very early morning trains brought fair sized lists of passengers. Some of the camps are already closing for the season, and others who have but four or five guests for the balance of the season, wish that they, too, might shut up and save further expense. Still others report that they are doing an excellent business—in fact, the best for years. But it seems beyond question that the sportsman travel from "outside" has dropped off materially from what it was in 1902. One camp proprietor told your correspondent one day this week that of the twenty-nine persons who had made dates with him for the fall hunting, every one had cancelled his engagement.

Friday afternoon it began to snow here in Bangor, and by night it was coming down thick and fast, extending clear to the St. John River, and covering all the territory in the Maine woods with the soft white blanket that the still-hunter looks eagerly forward to. Like a blizzard, almost, the snowfall has continued through to-day, and is still falling at this writing, which means that the first clear day will see some great tracking done, to be followed by a big exodus from the woods of successful hunters.

HERBERT W. ROWE.

All communications for Forest and Stream must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Long Island Shooting.

BAYPORT, L. I., Nov. 7.—*Editor Forest and Stream:* The past week has been most successful for duck shooters, and will no doubt improve with the cold snap which has just set in. The weather has been like summer, the sun shining down on the gunner in the box was so hot, as one gentleman remarked, it was hard work to keep awake, and I believe from what the guides tell me some of them were really guilty of taking a nap. The ducks, by the way they acted, looked as if they would like to do likewise, and seemed to resent being disturbed, for when the sloop went around to put them on the wing they flew but a very short distance before alighting again, which made it difficult to get them over the battery. The bay in this neighborhood is full of ducks, enormous flocks half a mile in length being a common sight, and they are liable to stay, as the feeding grounds are in good shape.

Among the lucky duck hunters this week were W. A. Williamson, of Newark, with Capt. Green, 75 broadbills; H. W. Knight, of Newark, 45 broadbills, 2 redheads, 1 black duck, 4 coots. Mr. Freeman, of New York, with Capt. Still, 22 broadbills. Mr. Such, Perth Amboy, with Capt. Will Brown, 49. Dr. Robinson and his son, of Sayville, with Capt. Rhodes, two days, 76. Mr. S. G. Painter, of New York, with Capt. Brown, 19 broadbills, 1 redhead. Mr. J. Suydam, New York, 37 broadbills, 1 canvasback. Mr. Purdy, of New York, with his own ducking outfit, 75 in three days. Capt. Still, shooting for the market, got 103 ducks in two days.

The usual army of deer hunters have been out, and from what I have heard must have killed over a hundred deer within a radius of five or six miles from here, and not a single accident reported.

Quail shooting has not been up to the usual standard, though there are lots of birds here; but it was so dry the dog could not hold the scent. Four or five brace with a few rabbits and gray squirrels make the average bag. The most remarkable shot was made by Mr. Fred Ware, of New York, who got four birds with one barrel. A party of five went from here on Monday over to the beach rabbit shooting, and succeeded in getting thirty-two rabbit in one day.

HENRY STOKES.

Long Island Deer.

THE Long Island deer season comprises the four days, Nov. 4, 6, 11 and 13. It was estimated that a thousand and more hunters were out on the first day. Many took up their positions on the grounds the night before and waited for the coming of dawn to turn loose the dogs. Among the kills recorded by the Suffolk County News were the following:

The Bohemia Game Protection and Gun Club were on the ground early and their membership was augmented by scores of city hunters until their party is said to have numbered more than 125 men. They killed 21 deer, 6 does and 15 bucks, of which the finest was an eight-year-old buck with broad spreading antlers, killed by Joseph Hrabak.

The Wheeler Road Gun Club killed but one, a doe shot by Joseph Martin.

The Bohemia Sportsmen's Club got four, Dr. Robinson killing a doe and his son William killing a handsome buck; Frank Buchacek, of Islip, a doe, and Tom Farrell, of Babylon, a nice buck.

Another party from Babylon is credited with two bucks, one of which was afterward stolen.

William T. Rhodes killed a fine, large doe, and William F. LeCluse also got a doe. Lew Howe shot a buck, and Mr. Patterson, also of West Sayville, killed a large and handsome buck; Andrew Josten a doe.

The O'Berry brothers and their party from St. James got three.

The Northport Gun Club killed two, the lucky men being Postmaster George Call and Melville Nichols.

A party from Smithtown Branch killed two, and Riverhead sportsmen are also credited with two.

Captain Will Jeffrey shot two deer, a buck and a doe, on the Taylor estate; Joseph Lennon's party killed one doe, as did Milton Hawkins. A party of Orange county sportsmen shot a small doe. Martin Seezy killed one doe.

Nearly 100 deer were killed in all on the first day, and fewer on the second day.

Partridges Scarce in New England.

RYE, New York, Nov. 1.—I was a little disappointed this season in not finding at least the usual number of birds in the coveys. I have done considerable shooting in the New England States and I can never remember such a scarcity of partridges. One of the causes that has contributed to this was the unusual wet spring, consisting of twenty-one days of rain, which killed the young broods before they had half matured. I consider myself an amateur sportsman and never try to kill everything that moves, and I venture to say if I can kill half the number the law permits for one day's shoot, I am ready to turn for home full of glee and just as full of enthusiasm for the next day's hunt. The first four days of the open season my father, two friends and myself, all of us being considered fair shots in the field, went out expecting to have a hunt we had never experienced before after the favorable winter for birds, but instead of this we bagged one partridge and did not see more than half a dozen. We cannot blame this to the unfavorable locality and covers, because the section we generally hunt in is considered one of the best, and extends for miles around our farm.

The successful partridge shooter must be quick of eye, motion, and under no circumstances wait and be particular in having clear, open shots. If this may be the case, however, he will undoubtedly kill few birds. Cover shooting of all kinds, to be successful, requires the greatest quickness of mind and action. There is an advantage in all this in having modern facilities for the brush, and not be burdened with extra heavy clothes, and a firearm that will tire you before your day's hunt is half done.

My favorite gun for this work is one that weighs not more than 6½ pounds, cylinder bore, barrels and stock to be of best material that will assure safety.

I have killed a fair number of woodcock, and they seem to be well reported.

W. H. G.

Alaska Game Heads.

SEATTLE, Wash., Nov. 7.—A party of Scotch and English gentlemen, who spent the entire summer in the Cook's Inlet country hunting moose, mountain sheep, and the other big game of that country, has returned to Seattle. In the party are Lord Elphinstone, of Scotland; P. B. Venderbergh, of England; Andrew K. Stone, representing the American Museum of Natural History; and C. E. Radclyffe, of the British Museum. They brought back with them some very fine specimens of the big game of Alaska.

New York Game in New Jersey.

Two sportsmen of Little Falls, N. J., were heavily fined one day last week for having game in possession before the New Jersey season was open. Their plea was that they had brought the game home from Sullivan county, New York. This was only to say that in addition to breaking the law of New Jersey by having game in possession in close season, they had broken that of New York also by exporting game. The New York statute explicitly forbids the taking of game beyond its borders.

Nova Scotia Moose.

SOUTH BROOKFIELD, Nova Scotia, Nov. 4.—*Editor Forest and Stream:* Since writing you before there has been a large number of moose shot in this district. Bears are beginning to put in their appearance again. Hope to have a good report on them. Clifton Hardy and Fred McLeod killed a moose last week that weighed, when dressed, 900 pounds. His antlers from tip to tip spread over five feet. This is the largest moose yet killed this season. G. S.

The Wild Ducks.

Large quantities of ducks are reported to have come in the Sound near Oyster Bay, Great South Bay, Barnegat, and Chesapeake Bays. While some very fair bags have been taken, the birds are not stooping well during the pleasant weather. It is expected that fine shooting can be had after the next storm.

Sea and River Fishing.

The Game Laws in Brief.

is the standard authority of fish and game laws of the United States and Canada. It tells everything and gives it correctly. See in advertising pages list of some of the dealers who handle the Brief.

Fish and Fishing.

The Fishes of New York State.

THERE is likely to be a big scramble for copies of the paper by Dr. Tarleton H. Bean, Chief of the Department of Fish and Game at the World's Fair, St. Louis, on the "Fishes of New York," reprinted from the Seventh Report of the State Forest, Fish and Game Commission. It includes, of course, the information contained in the same author's paper on the "Fishes of Long Island," published in the Sixth Report of the State Commissioners, or at least so much of it as refers to the food and game fishes of the island, which is about all that the majority of the readers of this column care much about. Not only is this paper of value because of the difficulty nowadays of obtaining copies of previous works on the subject by DeKay and Mitchell, but it is the most complete and up-to-date work on the matters of which it treats, and is printed and illustrated as none of its predecessors have been. Much successful investigation has been carried on since the days of DeKay and Mitchell, and the result of it all, so far as the food and game fishes of New York are concerned, has been taken advantage of by Dr. Bean in his preparation of the present report. With the exception of the late Mr. A. N. Cheney, Dr. Bean is the first prominent authority on fish and fishing to enlighten the general public as to recent efforts to introduce the different varieties of the Pacific Coast salmonidae into the waters of New York. There have been occasional official reports from the different State hatcheries by Mr. Annin and others, but these have not obtained very general circulation. So far, if we except the case of the rainbow trout, which was first planted in eastern waters more than two decades ago, there is no satisfactory proof of the success of the experiments in the east with the salmon of the Pacific Slope, such, for instance, as has followed the introduction from Europe of the brown or German trout, *Salmo fario*, and of the *Salmo trutta leuvenensis*, or Loch Leven trout. The Quinnet or King salmon, which is the largest of its kind, was introduced into some of the New York lakes a few years ago, and while the practicability of rearing this species in fresh waters without access to the sea has been satisfactorily demonstrated in France by Dr. Jousset de Bellesme, director of the aquarium of the Trocadero, in Paris, the results of the experiments with the same fish in New York waters are as yet unknown, though the outlook seems to be more favorable since the change of method by which larger fish are employed for transplanting purposes. Both the steelhead and the red-throat or Lake Tahoe trout now exist in New York waters, but it is too early as yet to say how they will succeed there. Anglers and net fishermen taking any unusual looking trout or salmon in the lakes or coastal streams or bays of the Empire State, may be able to render an interesting service to piscatorial science by reporting the fact, with a specimen of their catch, to the office of FOREST AND STREAM, the director of the New York Aquarium, or the superintendent of one of the State fish hatcheries, as may be most convenient.

The Smelt of Lake St. John.

There are landlocked smelts in some of the Canadian lakes as well as in the United States. Those in Lake Memphremagog, on the borders of Vermont and Quebec, are probably identical with the *Osmerus mordax* of the Atlantic Coast and Gulf and River St. Lawrence. Those

in Lake St. John present a beggarly, half-starved appearance as compared with the St. Lawrence fish. They more nearly approximate to the smelt found by Cope in Wilton Pond, Kennebec county, Maine, and described by him as *Osmerus spectrum*, in 1870. They are a favorite article of diet with the ouananiche, which, it has been suggested, might attain a larger size if a superior variety of smelts was planted in the lake for their benefit. The matter has been brought, more than once, to the attention of those mainly interested in the matter, but no action has yet been decided upon.

The Destructiveness of Pike.

There is much more than the importation of a better variety of smelts into Lake St. John that might be done for the safeguarding and improvement of the fishing in northern Quebec. It will be remembered that Dame Juliana Berners impressed upon her readers the duty, not only of busying themselves to nourish the game as much as possible, but also to destroy all such things as be devourers of it. And experience in every part of the world goes to prove that in the matter of both fish and game, it is as necessary to prevent the increase of their destroyers as it is to encourage their own natural increase, sometimes by artificial means. Loch Leven, in Scotland, of the fishing of which beautiful body of water Sir Walter Scott discusses so entertainingly in "The Abbott," and Doctor John Duncan Quackenbos has painted us so exquisitely a word picture, supplies an interesting case in point. In addition to the sporting, pink-fleshed trout for which its fame is world-wide, the lake contains both pike and perch, the last-named variety being very plentiful and affording excellent sport. From one cause or another the pike have been gradually gaining the upper hand in Loch Leven during the last two or three years. During the decade 1882-91 an average of 15,000 trout was killed with the rod on Loch Leven in each year, and the average individual weight of the fish was a little over 14 ounces. In the following decade the average number for each season was 18,000, while the weight had fallen to 12 2-3 ounces. In 1902, 8,000 trout were caught that averaged over one pound in weight, while during the last season the numbers dwindled down to 2,000, the average weight having risen to a shade under 1 pound 6 ounces. It seems that during the period 1882-91, the campaign against the pike was carried on assiduously, and even more zealously in the next ten years, when the numbers increased while the weight declined. The figures for 1902 and 1903 show that the smaller trout are falling an easy prey to the pike, and that only the heavier and stronger fish have a chance to escape their remorseless enemies. The spread and vigorous growth of weeds have been mentioned as contributing causes to the recent increase in the number of pike in Loch Leven, and undoubtedly weeds do interfere with netting as with other methods of destruction. The same condition of affairs exists in the Peribonca and some of the other northern rivers of Quebec. A vast number of these water wolves have been destroyed in various ways, both in the Peribonca and in Lake Tschotagama, but no systematic work of the kind has been carried on for some time past, and it goes almost without saying that water weeds interfere materially with it whenever it is attempted, because it is just in the stretches of rivers and portion of lakes where weeds abound that *Lucius lucius* selects his lair. On several English lakes, however, this difficulty is got over by the successful use of patent weed cutters, worked by machinery. Several of the young fish from the Roberval hatchery have been planted in some of the tributaries of the Peribonca, and there is no doubt that a large proportion of this output merely serves to keep the pike in good condition and assist them to put on weight, it being principally in the Grand Discharge that the output of the hatchery has succeeded in most largely increasing the supply of ouananiche.

Fishers of Men and of Fish.

A friend who was talking with me the other day about Walton's intimacy with so many bishops and other distinguished churchmen, and of the love of angling displayed by the clergy generally, related the story of two friends who recently fished for salmon together on the Bonaventure River. One was an Episcopalian minister, the other a Roman Catholic priest. After several unsuccessful attempts to raise a salmon in one of the pools, the Episcopalian handed his rod to the priest. At almost the first cast the latter rose and hooked a handsome fish. "You see," he said, turning to his Episcopalian friend, "to be a successful fisherman, it is before all things necessary to make sure of being in the direct line from St. Peter." Prominent churchmen in England are quite as much addicted to the pleasures of angling as those of America are, and only to-day I read that the Bishop of London and the Bishop of Bath and Wells have been among the recent anglers in the Tay, and that both prelates succeeded in landing some salmon and grilse from that river, while the guests of Lord Blythwood at Ballathie House near Stanley, Perthshire.

The Lobster and the Eagle.

As an excuse for dragging a lobster story into this column under the heading "Fish and Fishing," I can at least claim that much of the contention between the French and the English over the French shore difficulty in Newfoundland hinges upon the point as to whether or not a lobster is a fish, since the French fishermen claim the right to build lobster factories on the treaty coast in virtue of the clause of the treaty authorizing them to erect buildings for drying their fish.

The fisherman in this case was one of the white-headed eagles popularly known in Newfoundland as a grip. The story is told by Colonel Haggard, with whom I visited Newfoundland a few years ago in search of salmon. "John Stroud, one of our guides, and I," says the Colonel, "were sitting on the rocks by the seashore watching the grip soaring around in circles, when suddenly we saw him dash down into a pool of water close by us on the beach, and reappear holding an enormous lobster in his talons. He was an old lobster, with a huge claw white with barnacles; but the eagle had him clutched firmly around the back, and at first we could see the huge claw hanging helplessly down, the barnacles shining white in the sunlight. Only for a second, though. The ripples on the recently disturbed pool had not yet died away, the

large drops of water had not ceased to fall upon its surface from the soaring eagle's feathers and the captive lobster alike, when the latter suddenly awoke to the seriousness of the situation, and to think with that apparently helpless creature was to act, for he was a lobster of action. Up came the great white barnacled claw, and seized the eagle round the neck. The grip had got the grip now with a vengeance. There was a furious fluttering and beating of his wings, a melancholy squawk issued from his choking throat, and then, tumbling and rolling head over heels in the air in a confused mass, down came eagle and lobster again splash back into the pool. We rushed forward, thinking that we could perhaps in some way secure both combatants, as the splashing of the conflict continued in the shallow water. But we had hardly time to pick up a rock apiece to heave at the eagle, before the lobster, feeling himself at home again, let go his hold. Now, with his neck all torn and devoid of feathers, away flew the bedraggled eagle to a neighboring cliff, while, still brandishing his enormous claw in defiance, the lobster remained smiling at the bottom of the pool. But the grip will doubtless tell you, if you meet him, that the lobster fishing in Newfoundland is very poor at present, and that he is going to give it up, as the game is hardly worth the candle."

Riparian Ownership in Canada.

A case possessing very great interest for salmon fishermen who pursue their sport in the Dominion of Canada is now engaging the attention of the Superior Court of the city of Quebec. The action has been taken by the Attorney-General of the Province at the instance of the Fish and Game Department of the Government, against Alexander Fraser and others, and seeks to have it declared that the salmon fishing of the Moisie with rod and line, which is valued at several thousand dollars, is vested in the Government, notwithstanding that the land on either side of the fishing pools was conceded many years ago. In the endeavor to enforce its claims to the proprietorship of the fishing rights, the Government some time ago leased these rights to a Canadian for \$2,500 a year. The right of the lessee and his friends to enter on the river for the purpose of fishing it is denied by the riparian owners, and the present lawsuit is to test the interpretation of a judgment of the Privy Council in fishery matters so far as riparian rights are concerned, and to avoid conflict on the river. Incidentally, the navigability of the river is called in question, and the judgment in the case may affect the rights of the many American salmon fishermen who have paid out large sums of money for riparian rights in Canada. It is said that as much as \$30,000 was paid for the fishing rights in the Moisie by the Boston party who, conditionally upon the title being good, purchased the riparian rights of Mr. Fraser, and many others are said to have paid quite as much and even more for the riparian rights to the fishing in certain portions of the Restigouche and other Canadian rivers. If the Government wins this case it will doubtless assert its rights in other rivers similarly circumstanced, but there is no doubt that whichever way the judgment in the Superior Court goes it will be finally appealed to the highest court in the empire.

E. T. D. CHAMBERS.

Cincinnati Fishing Clubs.

CINCINNATI, O.—Situated as Cincinnati is, within easy reach of many excellent fishing waters, it is safe to say that probably no city in the country has as many fishing clubs and anglers. There are between sixty and seventy of these associations, each with a membership of at least ten, and in addition to their members, there are thousands of unattached anglers, these last including some of the most prominent professional and business men as well as those in humbler positions. Among them may be mentioned the following: Mayor Fleischman, who visits the East each year and wets his line in the waters of the Catskills, or, in his yacht, enjoys the more exciting sport found in deep sea fishing on the broad bosom of the Atlantic. Prof. J. Uri Lloyd, the well-known author of "Stringtown on the Pike," "Warwick of the Knobs," and other works, was one of the party of which ex-President Cleveland was a member, and which visited Middle Bass Island, Lake Erie, early this season. Mr. Lloyd's camp is situated on this island, and during the season he employs a small steamer to take him to his favorite fishing grounds on the Canadian shore. The chief of the fire department, Mr. Abe Fuerst, is only one of many of the fire fighters who are lovers of sport with rod and reel.

Mr. Alex. Starbuck, president of the Cuvier Club, spent the past season at Sea Gull, Ont., where he enjoyed good sport, although not so good as in previous years. The illegal net fishing, which is carried on, has reduced the number of fish greatly, and unless it can be stopped, this locality will, in a few more seasons, lose its reputation as a famous resort for lovers of black bass fishing.

Joseph Chambers, a retired capitalist, has had a wide experience as an angler, and has fished in probably all the noted waters from east to west. He has caught the tuna at Catalina Island, Cal., and last year wet his line in the waters of Bacchewausing Bay, Lake Superior, and at Sea Gull. The past season he was at the latter place with Mr. Starbuck, and while there caught, in the St. Mary's River, a typical specimen of the small-mouthed black bass weighing 5 pounds 5 ounces and measuring 20½ inches in length and 17½ inches in circumference. The specimen was also perfect in symmetry, something unusual in big fish. Mr. Starbuck had a snapshot of the fish taken, and on his arrival home took the film and had reproduced a fac simile of it of natural size. This photograph he had framed and presented to Mr. Chambers. The picture hangs in his rooms at the Grand Hotel, where it is admired by his friends and serves as a perpetual reminder of a most pleasant outing. This catch of Mr. Chambers' is a record one, as for a number of years no Cincinnati angler has captured one of this species of that weight. Last year Mr. Fuerst caught one at Pelee Island which weighed 5 pounds, this being the nearest approach to Mr. Chambers' prize.

Hon. T. A. Logan, well known and universally liked

by all lovers of sport with rod or gun, spent the past season in the Sault Ste. Marie region instead of on the famous Nipigon River, where he once used to wield the rod. This list might be extended indefinitely and would include the names of many who visit distant waters each season, and of many others who, lacking the time, find their sport, and it is good sport, too, nearer home in the waters of the Little and Big Miami rivers, and in the numerous lakes, ponds and rivers in the vicinity of the city.

Following is a list of a few of the more important clubs of the city: The Queen City Fishing Club was organized about twenty-three years ago, and is one of the oldest clubs in the city. The only one of the original members still retaining his membership is Mr. Frank Krippner. The club has a membership of thirty-seven, the officers being Mr. Joseph A. Busse, president; Mr. Arthur Bodey, secretary. The club establishes a camp each year, and has chosen a charming spot on the Big Miami River, at Cleves, about 17 miles from the city. Here, under the shade of immense trees, and with the sparkling waters of the river close at hand, they pitch their tents, the nearness of the city permitting the members to make frequent visits to camp and enjoy the pleasure of landing the gamy bass, which are quite plentiful.

The Bellevue Hunting and Fishing Club owns Belle Isle, a wooded island of about six acres, in the Big Miami River, near New Baltimore, O., where it has a handsome club house costing several thousand dollars, one of the best in this section of the country. The officers are: Geo. Osterfelt, president; Chas. Doer, secretary; Herman Osterfelt, treasurer; Louis Hahn, superintendent. Their camp home is one of the most beautiful spots on the river, which is noted for its scenery, and the fishing is excellent.

The Prospect Fishing Club has a membership which includes many well-known citizens, among them being Judge W. H. Lueders, Jacob Bernard, W. E. Bush, Dr. W. F. Mente and Robert Delke. The officers are: A. B. Schmidt, president; M. Kemen, vice-president; George Brockman, secretary; Jacob Woeliner, treasurer. Trustees: R. H. Schmidt, W. E. Bush, George Stitzle, F. H. Evers and Jacob Bernard. Eight-Mile, on the Ohio River, is the spot chosen for the club's camp.

The Norwood Nut Club is a fishing club organized in Norwood, O., a town adjoining Cincinnati. It has a membership of twenty-five, and is officered as follows: Charles Worthlin, president; Ed. Stackham, secretary and treasurer. The club has a camp on the Little Miami River.

The Red Nose Fishing Club takes its yearly outing at Noah's Lakes, Sewardsville, O.

The Bench Club has a very comfortable club house at Mohawk Bridge, on the Little Miami River, near Loveland, and the members enjoy good sport during the season.

The Twelfth Ward Fishing Club camps on the banks of the Ohio River, above Coney Island.

At Rylauds, Ky., a club of Cincinnati sportsmen have a club house on Crystal Lake, where there is the best of bass fishing. This is, however, a private preserve, and only members of the club and invited guests may enjoy the sport.

A list of the angling clubs would not be complete without mention of the Kingfishers, that aggregation of expert fishermen made famous by the facile pen of Mr. J. H. Hickman, better known to thousands of readers of the sportsman's press as Old Hickory. The club this year made its camp at Glen Arbor, Mich., where they enjoyed such fine sport last year.

Nor should the Cuvier Club be omitted from this list, for, although it is not a fishing club, it has done much in the protection of fish, and many of its members are enthusiastic anglers, notably Mr. Starbuck, the president, who tells the following hard luck story of his experience at Sea Gull this year: "Just as we reached an open glade, where the morning mists were raising jeweled arnis as the splendor of the day increased and painted the forest leaves in a glimmer of gold, we were tempted to try the inviting spot and again the anchor sought the bottom. Baiting anew with fresh and lively shiners, I tossed them lightly to the rippling waters, and on making a gentle movement of the bait a few inches above the bottom, I was suddenly surprised with a wicked snap of my minnow and a rapid rush of my line from the silvery spool. I struck, of course, at such earnest manifestations, and was sure I had the greedy biter impaled securely. Whizz, whizz, whizz, went the reel as the line ran rapidly out, while I was struggling with my utmost endeavors to check the swift speeding and frantic fish. There was no let up on his run, and after he had taken off about a hundred feet of my line, despite the pressure I had put on with my thumb, I was compelled to give him 'the butt' as a dernier ressort, as only a yard or two of line remained on my reel. Even at this he faltered but a trifle, for at the eventful crisis he made a violent and wicked struggle with a vicious shake of his head above water, and,

"Then all at once the slackened line
Stratched outward through the waters deep;
* * * One spring, and, like dissolving spray,
The line and leader parted."

My companion endeavored to console me by giving eclat to the situation by stating that it was a 75-pound muscalonge, and that nothing but a heavy trolling line of bell cord would have held him. I demurred to this statement by responding that it was not over 30 pounds in weight, and that if I had only 50 feet more of line I would have saved him. He would not budge a fraction on his figures, neither would I, and so it went to the jury, and a verdict was obtained on the general average principle, which brought the weight of the escaped fish to 52½ pounds. Damages being repaired to the demoralized line, I commenced the angle with a meekness and humility that would have been creditable to a saint. I had placed no value on the fish I had previously caught, but when a 52½-pound muscalonge is within your reach and to then lose him in a twinkling, almost, is some cause for lamentation and repining.

Following are a few of the localities near the city

where good fishing may be had: Little Miami and Whitewater rivers, about 20 miles from the city, on the Lawrenceburg Traction, from Sedamsville.

Indian Creek runs into the Big Miami River about a mile from Venice, O., 25 miles from Cincinnati; fine bass fishing.

Kings Mills, O., about a mile above the mills, Little Miami River.

Thom's Pond, three miles above Hamilton, O., bass. About 15 miles up the Licking River, Ky., along the Licking and Lexington pikes, good bass fishing.

The Ohio River furnishes good catfish, perch and salmon fishing.

There are many private ponds in near-by Kentucky towns where very good sport may be had on payment of a small fee, which includes use of tackle and bait.

BONASA.

The Red Gods.

TRENTON, Georgia, Nov. 4.—*Editor Forest and Stream:* I have been looking over some back numbers of *FOREST AND STREAM* and have been amused at the racket kicked up by some of your correspondents in their discussion of certain lines in a poem by Mr. Kipling. I am reminded of the two knights who fought over the white and black shield, only to learn later that it had more than one color; and also of the newly-fledged lieutenant referred to by Cabia Blanco as one who learned that everything is not taught at West Point. Many college graduates have found that this rule held good of their alma mater.

Among the things I have observed in the course of my life, is that it is often unwise to throw mud at the other fellow until it is fully established that he is wrong. If you think him in error, you can say so in a gentlemanly way, and state why you think so. Then, perhaps, he may thank you for your information.

One reason why I have always liked *FOREST AND STREAM* is that its editors have allowed a very considerable latitude to correspondents, and if one or more of them happened to be wrong somebody was pretty certain to rise and set them right, and this has furnished much good reading to the paper.

North, south, east and west, I have hunted and fished in my time, and I was on the Rangeleys before the most of your readers were born. Still, I was never on the rivers of New England when there happened to be a log-drive, and perhaps this is one reason why I never heard the click of an iron-shod canoe-pole. Knowing, as I do, something of rivers and acoustics, I doubt not that their click would be audible at a considerable distance. Mr. Hardy surely knows.

In Michigan such poles exist. I have seen them on Rapid River, and the guides of the Jordan use still, as I think, a long and narrow paddle with an iron point. A wooden point would of course be less liable to slip, but a good deal depends on the way the pole is used. I once cut a pole, which I whittled to a point, to help me in fording a dangerous "rip" on the Oconto River, in northern Wisconsin. The ice was running, and had I fallen, which I should surely have done but for the pole, "farewell Duncraggan's orphaned heir."

I never saw a "cooner" in Maine, nor a "bat" in the south, but they might have been there for all that. I have seen many log-jams of all descriptions. Some of them were "raw."

I have sunned and slept on bars of sand and bars of shingle. I have rarely camped under my canoe, and I like to see the starlight when I close my eyes. It's friendly, like the many voices of the night.

Let me see—what else was there? Oh, the "silent, smoky Indian." Well, I have seen lots of them, of all, or nearly all, descriptions, and although they often appear silent, the most of them can talk and joke upon occasion. Not often, though, when they act as guides. The Pueblo Indians of New Mexico are not smoky, neither are the Hualapais of the Arizona desert, but the last are certainly the most disagreeable savages I ever saw. I think that, ordinarily, the further north you go the more smoky are the Indians. And although this is not always the case, when they are smoky they are quite as useful at guiding or paddling as though they had never inhaled the pyroligneous odors.

One other thing I recall—not a very little matter, either, to one who would have the best "bough berth" the woods afford. Nothing is better than hemlock tips. Fir will do (they often call it "far" in Maine and New Hampshire), but don't take spruce if you can help it. It's too prickly.

I believe that is all for this time, but will say that you don't often catch Kipling tripping.

KELPIE.

Editor Forest and Stream:

In his criticism of the line,

To the click of shod canoe-poles round the bend

Mr. Brown asserts that in order to be good poetry the language must needs have application to canoe-poles wherever used. Now, any sane reader of the entire poem knows at once that the lines have a limited application, and knows at least that they apply to a particular side of the "Four-way Lodge," to a particular part of the world. If the reader has visited Maine or one of the Canadian provinces he appreciates the application in its fullness. He knows this from the language of the first line of the poem, "Now the Four-way Lodge is open," and from the first lines of the second, third, and fourth verses, which are respectively as follows:

"Do you know the shallow Baltic, where the seas are steep and short,"

"Do you know the pile-built village, where the sago-dealers trade,"

"Do you know the world's white roof-tree—do you know that windy rift."

As to the last line of the verse,

For the Red Gods call us out and we must go.

The sentence forms the last line in verses 2, 3 and 4. and in each case, as in the first verse, is preceded by a word picture, strongly painted and true, portraying the nature surroundings and the pleasures found by the angler, the lover of the sea, the naturalist and the hunter. A word picture appealing to the desire that is always present, a desire which draws just such pictures in the imagination, and which is in turn whetted thereby. A de-

sire which is an ever-burning fire, flickering low at times through circumstances or change of seasons, but needing but scant fuel or a turning of the coals to burst into flame. Brother angler, when the trout season approaches and the fever grows apace and you fondle your fly-book and your tackle, and you see in fond imagery the stream hastening over sun-glanced shallows and whirling in eddies at each turn, is it not the Red Gods of desire that call thee out?

Brother yachtsman, when the yachting season comes and the boat needs overhauling and there is much tinkering to be done, when you smell the salt air at the home port, is it not the same Red Gods that call thee out?

Brother naturalist, when you think of far off climes, and you depart with your nets and your boxes and with thoughts of new specimens awaiting you, did not the Red God call thee out?

Brother hunter, when earth is in the sere and yellow leaf and you also gather together your guns and your duffle and dream of "camps of proved desire and known delight" and of the head of heads that awaits the crack of your rifle in the stillness of a Canadian forest, did the Red God call unto you?

Where, in the realm of poetry, can we find better expression of that aroused desire than in that line, "The Red Gods call us out, and we must go." What is the foundation of that desire? An intense love, a passion, that gnaws at our very souls, that draws mental pictures which beckon and summon and call us out; an intensity of yearning to which we must yield, come what may; and the God that calls us out and is so supreme over us, he is not described by the adjective blue or black or amber, but by the adjective red—red unto the color of the heart's blood, the color which since man began to live has been forever and immortally associated with passion and love.

KENNETH FOWLER.

Editor Forest and Stream:

Your correspondent, E. P. Jaques, wants five questions answered "by the able defenders of Kipling." He wants the answers to agree. The questions have been answered by several correspondents, and the answers have agreed, except in minor points, but as Mr. Jaques does not seem to know it, I will edit the answers for his benefit.

Question No. 1—"What is meant by the 'Red Gods have called?'" His quotation is wrong. I give the line in question:

"For the Red Gods call us out, and we must go."

I suppose if Kipling had used the phrase, "The red salmon and trout call us out," Mr. Jaques would have been content. Evidently he cannot appreciate poetic license. When I read the phrase I thought it well applied. The gods are worshipped, and thousands of persons worship the trout and salmon. Why not in poetry call them the "Red Gods?"

His next question—"What is 'traces' in connection with 'rods and reels?'" I don't know what Mr. Jaques is driving at. Certainly anyone ought to know that Kipling was referring to fishing gear that was to be used on the trip. He could have added flies, spoons, and leaders, as well.

"What is a 'raw log-jam?'" This question comes right home to me. I have helped to break more raw log-jams than Mr. Jaques is months old. Raw, as applied to a log-jam, means rough, but it is used by log drivers when the word rough is not expressive enough. When driving logs, if I was told that a jam was a "raw one" I should expect to see logs crossed and criss-crossed, and ended up in all manner of angles. The expression "a raw stretch of water" is as common as a "raw day." The word is used by log drivers and lumbermen, and when applied to a log-jam it fills the bill.

"What is a 'right-angled log jam?'"

A right-angled log-jam would be one at a right angle with the stream; that is, one that formed directly across the stream from bank to bank. Most log-jams form in this manner. Sometimes a jam forms in an acute angle; that is, one end of the jam is further down stream than the other. Such jams are terrors to the log driver, for the water back of the jam instead of forcing the logs down stream press them to the bank. As soon as a few logs are picked and lifted out and go down stream, the jam starts just enough to fill the vacant space, and sometimes the whole jam has to be worked out log at a time. These jams usually form where there is a bend in the stream.

His last question, "What does 'at the end' mean?" is plain enough to me. Kipling, without doubt, meant the end of the jam, and not, as Mr. Jaques imagines, the end of the stream.

Usually log drivers speak of the lower end of a jam as "the foot," and the upper end as the head, but the phrase, "the end of the jam" is not uncommon, and doubtless Kipling so understood it.

HERMIT.

A Pennsylvania Hatchery.

THE Pennsylvania State Department of Fisheries has purchased the Hoy property adjoining the new State hatchery at Bellefonte, thus securing a dwelling house and barn for the convenience of the superintendent, besides rounding out a fine property. The new hatchery building at Bellefonte is well under way, and the ponds will all be completed before winter sets in. The water from the Shugard spring is piped through a ten-inch main, and with water on the place there is a flow of at least 4,000 gallons a minute. Bellefonte will have the largest trout hatchery in the world. The United States Fish Commission has sent the new hatchery 1,000 yearling trout; the Blooming Grove Association has offered to donate 10,000 yearlings and two-year-olds and about 200,000 eggs. The people near Ulysses offer 3,000 fish, and all these with the eggs from the old hatchery at Allentown, will give the new hatchery at Bellefonte a good start next spring with something like 2,000,000 fry. The Department expects to double this number for distribution next year.

The fish wardens have been doing good work recently. Three of them arrested fifteen illegal fishermen in one week, and they expect to make as many more arrests. One warden is after a man who caught undersized trout near the close of the season. The evidence is plain, and when the man is captured it will cost him \$400 and costs.

Salmon Fishing in British Columbia

From the London Fishing Gazette.

HEARING that large salmon were to be caught off the mouth of the Campbell River, in Vancouver Island, my wife and I started off to try our luck on Aug. 20 last. In order to reach this place we had to take the steamer, which sails daily from Vancouver to Nanaimo, and then change into another from there to Comox, where we were to be met by a man who would accompany us as guide, cook, etc. We were favored with very fine weather, and arrived safely at Comox, a small settlement on the east side of the island, which was enlivened at the time by having H. M. S. Grafton and an attendant torpedo boat lying at anchor there. The ships of the Pacific fleet, whose headquarters are at Esquimalt, go to Comox for the purpose of musketry and big gun practice, and as will be seen, it was a lucky occurrence for us their being there. We were met by our guide, a son of an Englishman, who had come out from "the old country" some years ago, and who was living on a "ranch" about fifteen miles from Comox. On our way up on the steamer a man and his wife had come on board, who turned out to be an elder brother of our guide's, so we all joined forces and agreed to camp together. From Comox to our fishing ground was some twenty miles or so up the coast, and as the trail only went some eighteen miles, we were considering how we were to get all our camp equipment, etc., to the required place, when the difficulty was solved in a most satisfactory and pleasing manner. The commander of the torpedo boat heard we were wanting to go to Campbell River, and as he was under orders to go there himself next morning, most kindly offered to take us up, an offer which we were only too glad to accept. On reaching our camping ground next day, we landed in small boats, and soon had our tents up and everything in order. The weather was fine, and we heard the fish were running well. The method of catching these large fish is as follows: You go out in a boat at certain times of the tide, and the bait is a huge artificial spoon (about four or five inches long). You let out some thirty or forty yards of line with heavy leads on it (about one-half pound in weight), and this you trail after the boat. Although these enormous salmon can be seen rolling on the top of the water like porpoises (and I may here say that unless they are doing so it is little use fishing), unless your line is well weighted and kept down in the water, instead of catching the "tyee," as they are called locally, you will catch the smaller kind called "cohoes," which run any weight from 6 or 7 to 20 pounds. Your boat must be kept going at a fair, but not too fast, pace, and when one of these "tyees" take the spoon you can tell directly. They generally make a first grand rush. Perhaps 80 to 100 yards of line go out like lightning, and woe betide you if there is any hitch, for if there unhappily is a general smash-up ensues. After this they stop, and you can get line in, and then they generally bore down, which makes a terrible strain on the rod. The first "big 'un" I got into I shall not readily forget. I had him on exactly forty-seven minutes, and he took me two miles down the coast before we could gaff him. Eventually, we got him into the boat, and on getting home he weighed 56 pounds. His dimensions were: Length, 4 feet 2 inches; girth (at shoulders), 2 feet 6½ inches, and his tail was exactly 11 inches across. This turned out the biggest fish I caught. I got another 44 pounds, and then turned my rod over to my wife. She caught three, which weighed just 120 pounds (43, 40 and 37 pounds), not bad work for a lady! We lost about a dozen "tyees" I should say, and caught some dozen smaller "cohoes"—in the week about 450 pounds to 500 pounds of salmon. One angler there, a Dr. D—, who had been out every day for a month, caught 94, which weighed 3,760 pounds—just an average of 40 pounds to a fish. He caught one 59 pounds, but I believe mine was the second largest caught this last season. There were some twelve other parties fishing while we were there, and on a good evening I have heard reels screeching in all directions. These fish are most excellent eating, and luckily, there is no waste, however many you may catch, as the Siwash (Indians) are only too glad to have them, as they "smoke" them and use them for food in the winter. This fishing, being in salt water, is free to anyone who likes to get a boat and go out. Of course, this "trailing" is not the sport fly-fishing or "spinning" would be, but to get a 40-pound or 50-pound salmon on even a spoon-bait is not to be despised, as because you have hooked him, it by no means follows you have caught him. Full of life and vigor, they are not yours till in the boat, and the number of spoons left in fish at the mouth of Campbell River would be sufficient to start a business. The curious thing is directly they leave the salt water, it is absolutely useless to fish for them. I was by a pool not 300 yards from the actual mouth of the river, full of these big fish rolling about, but you might have just as well tried to catch salmon in the round pond at Kensington Gardens as get these fish to look at your spoon. There is a little expense attached to this fishing. You must have first rate tackle and plenty of it, and you must hire a boat, which you can do on the spot for \$2 (8s.) a day. You want a man to row you about, and this is the most expensive portion, as wages are so high in this country. I paid mine, who besides rowing me about, cooked for me, looked after the camp, etc., \$3.50 per diem—in other words, 14s. a day and his keep. This, of course, sounds high, but it must be remembered that here the ordinary laborer can get \$2 (8s.) a day and his food. Another thing is that unlike salmon fishing in Scotland, where, perhaps, you are paying £60 or £90 a month for the right of fishing alone, and then may catch next to nothing, here you are absolutely certain of catching fish that average 40 pounds. I was told of a fish of 72 pounds having been killed with rod and line, but I cannot vouch for the truth of this. All the same, I do not see why this should not have been done, as it is impossible to say to what weight salmon can or cannot grow in salt water.

Anyway, we had a delightful trip, and enjoyed ourselves extremely. After we had had a week of this fishing I went out into the woods after elk, where, again, I was successful, but, as Rudyard Kipling says, that is another story.

I would like to add that all the fish above referred to were caught on a rod made by those well-known and first class makers, Messrs. Hardy Bros., Alnwick. It was a Greenheart spinning rod, which they call the "Murdoch," 11½ feet long, and a better rod I never handled. My lines, reels, etc., were all from the same firm, and gave me every satisfaction, a highly important item when playing a 50-pound salmon.

W. H. CUNLIFFE.

Vancouver, British Columbia, October, 1903.

[It is not often that a lady beats Mrs. Cunliffe's three fish, weighing 120 pounds; the 43-pound fish was on 37 minutes, and Mrs. Cunliffe had no help whatever, and brought the fish to the gaff herself. Colonel Cunliffe ought to have sent her portrait with the fish. His 56-pounder is a grand fish.—Editor Fishing Gazette.]

Can Fish Count?

MANY of your readers, I think, must at times grow weary of detailed lists of fish slain, and occasionally—very occasionally—lost, however artfully the catch may be seasoned, and, I fear, sometimes cooked, by skilled correspondents. Even the success obtained by a new pattern on a treble o hook, accurately placed under difficulties that would be fatal to an angler less masterly than the narrator, fails to awaken keen interest on the twentieth, or may be on the thirtieth, repetition, however cleverly the scene and accessories may be varied. *Toujours perdrix*, etc. For a wholesome, if homely, change of diet I propose, therefore, to send you one of many disjointed thoughts that have risen when the fish would not rise. It is of small value in itself, but touches on a subject dealt with, so far as I am aware, by none of our writers on fish and fishing.

We have had many learned disquisitions on the senses of sight, hearing, and taste in fish; nay, some authorities have even attributed to them a faint power of smell. Facts have been recorded leading us to believe they are by no means devoid of memory; but who can tell us whether they can count? That some birds can count—or, rather, distinguish between one and two or more objects—is well known; but they are soon at the end of their arithmetic. If two men go into a shooting hut, or hide, together, wood pigeons that have been scared will quickly return when one man has come out again and gone away. Not so a carrion crow. He will not venture till both men have retired. But even he cannot count beyond the figure 2. If three men go into hiding together and two withdraw, after a short interval, the crow will fearlessly come back to finish his repast, regardless of the planted gunner. My authority for this statement is the word of a true sportsman and observant naturalist. The behavior of the pigeons has come within my own experience. But what of our fish?

More years ago than I should care to mention were I not a "mere male," I rented some water on the Test at Romsey. A road bounded the water on the right bank. Some ten or twelve yards from the road, just opposite to a lamp post, a trout had taken up his position. This road was on my nearest way to the railway station, and every Monday morning after my week-end fishing, I used to pause at the lamp post and watch my friend. He took little notice of me, but if I stared too long at him he would slowly sink a few inches deeper under water. I knew his position to an inch, and, creeping on hands and knees on the gritty road, I tried more than once to seduce him with the most tempting flies—dry, wet, and waterlogged. In vain! After many failures I thirsted for the blood of that fish! One day I was walking with a friend, who was fishing with me. We paused, as usual, at the lamp post and gazed longingly, but not lovingly, at the trout. By chance a good fish rose some forty yards higher up stream, and my friend hurried off to cast for it. As he left I drew back quietly into the middle of the road, and, without even taking the trouble to kneel down, cast carelessly over my other friend. He took it with as little hesitation as a city magnate would have shown in swallowing an oyster before the late typhoid scare.

Many years afterward I was fishing on the Leach, in Gloucestershire. A path ran by the river side. At one point the path passed over a culvert close to the stream. This was the only way across a wide ditch at right angles to the river. In crossing this culvert I constantly put down a good fish. Trees and bushes made it impossible—for me, at any rate—to cover this fish until I had crossed the culvert. One day I crossed it in company with a farmer, who was going to a meadow further on. The fish, as usual, made for the nearest weed, as the water was too shallow to admit of his sinking, until we had passed. Remembering my experience at Romsey, I bid the farmer "Good day," and walked inland some fifteen yards from the water. After waiting ten minutes or so I crept on my knees within drifting distance of the fish, and was rewarded by a tight line. Two facts are not sufficient grounds on which to build a theory, but were they mere accidents, or can fish count?—Basil Field in *London Field*.

Cincinnati Anglers.

CINCINNATI, Nov. 7.—Mr. T. J. Mulvihill and Mr. J. H. Duncan fished this season in Stoney Lake, near Burleigh Falls, Can. Evidence of the sport they had and their skill as anglers may be seen in a store window on Government Square, where two large specimens of muscalonge are on exhibition. The fish were caught on Sept. 17 and 18, are three feet long and weigh about 23 pounds. Mr. Duncan's fish, taken on the 18th, was a trifle the larger of the two.

D. H. E.

A Flatboat's Long Voyage.

MOORED for a few days' rest before resuming her course in the Mississippi currents to her destination at New Orleans, the "shanty," or trading boat, *Sargassa*, which, with her captain and a crew of three able-bodied rivermen, has come from the faraway Yellowstone, 500 miles beyond the source of the Missouri, her owner bargaining with Indians and white, collecting buffalo horns, old iron, junk of every description, for sale to St. Louis, Kansas City, Memphis and New Orleans dealers.

Borne as the eddying currents might dictate, propelled at times by hand, vainly endeavoring to avoid the shifting sandbars, the drifting snags, and the wire ferries which span the upper rivers, the *Sargassa* has been nearly six months doing her 2,000 miles from Billings, Mont., to St. Louis. Altogether, more than 3,000 miles will be covered.

Captain Henry C. Sharpless, the owner of the *Sargassa*, has many strange things to tell of that long, but to him, never tiresome journey. For days the little boat plunged down the swiftly flowing Yellowstone, upon which no steamboat plies, and where for a week at a time no human being was to be seen.

Drifting on to sandbars in the "Big Muddy," where at times the captain was compelled to discharge tons of freight in order to release the boat, then to lay by for days to regain his cargo, the *Sargassa's* crew had plenty to occupy them all the time.

"Of course, we had to lay up every night. It was hard enough to get along in daytime," said Captain Sharpless yesterday. "We never grew weary, however. We would go out and chase rabbits, and some times lay off for a day or two along the Yellowstone to hunt bigger game. There was plenty of elk and game of all sorts, rainbow trout and ripening nuts, so we never suffered for good food.

"The Yellowstone is a magnificent country for scenery, and the current swept us along at a five-mile-an-hour gait past the white-capped Crazy Mountains and Big Horns. We enjoyed even the loneliness of the region. When we would come to some little trading place or postoffice settlement, the people would come out as though we were an entire circus outfit. They were glad to trade and glad to talk.

"When we struck the 'Big Muddy' at Fort Buford, N. D., things began to get more ragged. We thought we had passed all the wire ferries on the Yellowstone, and from the temporary tents we had used till then we moved into a newly constructed 'shanty,' built at the stern of the boat, which was cabin and galley in one. We were fooled about the wire ferries, however, and one day, without ten minutes' notice, we saw one of the things stretching out ahead of us with a strong current bearing us down upon it. There was some scrambling among the crew. We finally got one of our big oars under the wire and got it on deck. Then the current gave us a twist, and the wire and the crew got in a tangle, and the first thing I knew I was lying in a heap in the scrap pile. We got past it at last, but there was some 'river talk' on board that boat that would not look well in print.

"Up at a spot they call De Gray, on the upper Mississippi, we got on the worst bar of the trip, and it was not until we had thrown about seventy-five tons of stuff overboard that we got afloat. We managed to get some skiffs and fish about sixty tons of it back. That took about a week."

Captain Sharpless makes flat boating pay. He disposed of about 100 tons of material at Kansas City for \$14 a ton, and will have no trouble in getting equally good prices for what he has left.

As soon as he unloads here he will start out for Memphis and will have picked up another boatload of junk to sell there. He will then have a third cargo to pick up for sale in New Orleans.

Captain Sharpless is from a Philadelphia Quaker family, and has been on the Western rivers nearly all his life.—St. Louis Republic.

The Tuna Club Tournament.

AVALON, Cal., Nov. 1.—We have angling tournaments in many countries, but possibly the one started and carried on every year by the Tuna Club of Santa Catalina Island, California, is the most interesting, inasmuch as it was suggested to educate that unpopular person, the "game hog." From 80,000 to 100,000 people visit this island every year, and among such a swarm of anglers many will, of course, be ignorant of the methods of honorable fishing and try for all they can catch, resulting in over catching. The club established a series of rules, one of which was that rods alone should be used, and lines not over 21 strand; this, as was the object, prevented the public from using hand lines by which they could haul in big fish rapidly, and forced them to use the light tackle by which it took from fifteen to thirty minutes to land a twenty-pound fish. In a word, it kept the "game hog" at work on one fish, when with the hand line he could catch four or six. Of course this is not a complete undoing for the non-sportsman-like angler, but it reduces the catch. The club gives the tournaments to encourage the use of the lightest tackle for big game fishes, and as a result among the one hundred or more boatmen of Avalon every one has a fine equipment of rods and fine lines, and as no records or prizes can be obtained with anything else, the hand line is not known at Santa Catalina, and the game hog, if he will be one, is obliged to work and work hard for the prey which constitutes his big string. The tournaments last from May until November, and the prizes for the tournament of 1903 are as follows:

For first tuna of the season, H. E. Smith, of New York, received a fine agate-tipped rod. The score for largest tuna of the season, for which Montgomery Bros., jewelers, of Los Angeles, offered a special silver cup, was tied, H. E. Smith, of New York city, and B. F. Alden, of Chicago, each taking one weighing 94 pounds. They will each have their names inscribed in the cup.

For smallest tuna, H. L. Packard, of Bakersfield, Cal., was awarded a rod.

Black sea bass, Edward Llewellyn, of Los Angeles, takes both first and second prizes. His largest fish weighed 425 pounds, which establishes a new record. The second largest weighed 379; for each Mr. Llewellyn received a rod.

Smallest black sea bass, which weighed but 34 pounds, fell to T. McD. Potter, of Los Angeles, for which he received a rod.

Largest white sea bass, 52 pounds, William Porter Adams, of Chicago, was awarded a tackle box.

Second largest white sea bass, 51½ pounds, Ernest Fallon received a gaff.

Largest yellowtail, 46 pounds, F. P. Newport, of Los Angeles, was awarded a rod.

W. A. Holt, M.D., of Globe, Ariz., had the second largest, 44 pounds, and received a gaff.

For largest albicore, 38 pounds, John Van Liena, of Los Angeles, received a rod.

For largest rock bass, 9½ pounds, Rev. H. D. Ward, of Huron, S. D., received a line dryer.

For largest whitefish, L. G. Murphy, of Converse, Ind., received a gaff.

Harry Doss received a fine agate-tipped silver-mounted rod for best-equipped launch over four horse-power.

Harry Nichols received a similar rod for best equipped launch under four horse-power.

Harry Elms, the boatman taking the first tuna of the season, was awarded a rod.

The present holders of cups and records are: Largest tuna—C. F. Holder, Pasadena, 1899, 183 pounds; Col. C. P. Morehouse, Pasadena, 1900, 251 pounds; F. S. Schenck, Brooklyn, N. Y., 1901, 158 pounds; F. V. Rider, Avalon, 1901, 158 pounds; John E. Stearns, Los Angeles, 1902, 197 pounds. Black sea bass—F. V. Rider, Avalon, 1898, 327 pounds; T. S. Manning, Avalon, 1899, 370 pounds; F. S. Schenck, Brooklyn, N. Y., 1900, 384 pounds; A. C. Thompson, Pomona, 1901, 384 pounds; H. T. Kendall, Pasadena, 1902, 419 pounds. Largest yellowtail—F. V. Rider, Avalon, 1898, 41 pounds; F. S. Gerrish, Jacksonville, Fla., 1899, 37 pounds; R. F. Stocking, Los Angeles, 1900, 48 pounds; T. S. Manning, 1901, 33 pounds; Dr. Trowbridge, Fresno, 1902, 47½ pounds.

Strange Thing to Steal.

SOMEWHERE in St. Louis is concealed a man who has stolen 15,000 minnows; and he must have the minnows with him, since they can be found nowhere. Next to stealing a hippopotamus or a tombstone, one would think 15,000 minnows would be the hardest thing to steal. But nothing is safe. Still we may be cheered over this evidence of originality. One does get so tired of reading about the stolen diamond sunbursts and necklaces and solitaire rings which our fellow citizens seems to own chiefly for the pleasurable excitement of having them stolen. What a dull life this would be to some if they were not the happy owners of a chamois bag full of gems. Not one flutter beyond the ordinary in a whole decade of one's existence, except the occasional visit of a porch climber, the burglar, or the frequent theft by the trusted house servant. And only a languid thrill to the public in the ever recurrent list where the two rhinestone earrings, the mother-of-pearl stickpin, the turquoise bracelet of pale blue glass, the rolled plate cuff buttons are listed in the papers. When it is 15,000 minnows stolen it is quite different. This puts some life into the daily criminal annals. It shows a novelty of conception and an attention to detail in perpetration. Every theft done in St. Louis is marked by peculiar features, in which it resembles some other theft by which the detectives may trace it to its author. But the stealing of 15,000 minnows stands alone. It has no precedent. It becomes a freak in criminal history. It is corroboration of the theory that theft is due to sudden recurring aberrations, in which the victim takes the first thing he can carry off. It may be a barrel of tar or a doorplate, a bucket of molasses, a parrot, or 15,000 minnows. Insanity is about the only thing that can account for it.—St. Louis Globe-Democrat.

Book Review.

THE LITTLE FORESTERS: Stories of Bird and Animal Life as the Actors Themselves See It. By Clarence Hawkes, author of "Master Frisky." Price, 60 cents. Thomas Y. Crowell & Co., New York, publishers.

This is a very clever nature book, whose subjects are delightfully and very naturally treated, as if the writer were one of them. There are fourteen character illustrations by Copeland which add materially to the interest of the situations, not always pleasant, in which the furred and feathered denizens of the woods find themselves during the vicissitudes of a lively summer season; and when they all meet eventually in the fall to review the past and prepare to separate for southern climes, the breaking up of old associations is really affecting. Even the owls and the hawks seem reluctant to have the others go, and the reader cannot doubt their sincerity. One has to be imbued with a true love for nature and its aspects and belongings to be able to write in this vein.

The tendency in these days to invest the more familiar orders of the brute creation with mentality does much to increase one's personal interest in them. Nature books are valuable coefficients to the propaganda of "Audubon Societies" and other organizations for the prevention of cruelty to animals and their wanton destruction. "It is hard for us human beings" (as the author says), "who live under the protection of the State and its laws, to realize this constant fear in which the little people of the forest live."

CHARLES HALLOCK.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

FIELD TRIALS.

Nov. 16.—Robinson, Ill.—Illinois Field Trial Association trials. W. R. Green, Sec'y, Marshall, Ill.
Nov. 23.—Robinson, Ill.—American Championship Field Trial Association trials. H. S. Humphrey, Sec'y, Indianapolis, Ind.
Dec. 1.—Clay City, Ind.—Indiana Field Trial Club trials. C. F. Young, Sec'y.
Dec. 5.—Thomasville, Ga.—Continental Field Trial Club trials. John White, Sec'y, Hempstead, N. Y.
Nov. 16.—Holmdel, N. J.—Pointer Club of America's trials. C. F. Lewis, Sec'y, New York city.
Nov. 30.—Chase, City, Va.—Virginia Field Trial Association trials. Charles B. Cooke, Sec'y, Richmond, Va.

Points and Flushes.

Entries to the Virginia Kennel Club's third annual bench show close on November 20. The entry fee is \$1.50. The premium list can be obtained of the secretary, Mr. Chas. B. Cooke, Masonic Temple, Richmond, Va.

The total number of entries of the Brooklyn dog show, this week, is 805.

Canoeing.

Prizes for Canoeists.

IN order to encourage canoeists and small boat sailors, who do their knocking about on inland waters, to keep a record of their trips and experiences, the publishers of FOREST AND STREAM offer cash prizes for the best accounts of cruises taken during the season of 1903. As few restrictions as possible will be imposed, and those given are made only with the view of securing some uniformity among the competitors' stories, so that the judges will be able to make a fair award.

The prizes will be as follows:

First prize, \$50.00.

Second prize, \$25.00.

Third prize, \$15.00.

Fourth and fifth, \$10.00 each.

Sixth to eighth, \$5.00 each.

I. The cruise must be actually taken between May 1 and November 1, 1903.

II. The cruise must be made on the (fresh water) inland streams and lakes of the United States or Canada.

III. The canoe or boat in which the cruise is made must not be more than 18ft. long over all.

IV. An accurate log of the trip must be kept, and all incidents and information that would be of value to other canoeists covering the same route should be carefully recorded.

V. A description of the boat in which the cruise is made should preface the story, and a list of outfit and supplies.

VI. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

VII. Stories should contain not less than five thousand words, written on one side of the paper only.

VIII. When practicable an outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in. While a chart will count in estimating the events of the log, it is not a necessary factor, and a log may be sent without it.

IX. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

Each manuscript to which a prize is awarded shall become the property of the Forest and Stream Publishing Company. All manuscript should reach the office of the Forest and Stream Publishing Company, 346 Broadway, New York, on or before December 1, 1903.

CANOEING NEWS NOTES.

THE A. C. A. has recently come into possession of a most interesting relic of the earlier canoeing days in this country, i. e., the famous paper canoe, the Maria Theresa, in which the late N. H. Bishop made his memorable voyage from Quebec to the Gulf of Mexico. The canoe is still in first-class condition, considering its age. It was turned over to President Wilkin, of the Board of Governors, by Mr. Bishop's executors, together with the original "Sneak Box," and will be held in trust by him, pending such time as the A. C. A. is able to provide suitable quarters for it, and other trophies and souvenirs of the fraternity which it owns.

Mr. L. E. James, of Cuyahoga Falls, Ohio, No. 1 in the American Canoe Association, was a recent visitor at the New York C. C. This goes to prove that the interest in canoeing, once manifested, never dies out in those who appreciate nature's truest and best recreation.

The Wee-Missouri C. C. has been founded by a number of canoeists in St. Louis and vicinity, with quarters on the Meramec River. This will be of interest to A. C. A. men visiting the Exposition in that city next summer.

Joseph Jefferson has stocked the lake on his Louisiana farm with bass and other game fish.

"Not long ago," says the comedian, "I came upon a stranger fishing in my lake. I did not learn until afterward that the trespasser had been there all the afternoon without a bite. Stepping to his side, I politely invited his attention to the fact that he was fishing in a private preserve, in violation of the law.

"The stranger smiled sadly. 'You are mistaken, sir,' he replied. 'I'm not catching your fish; I'm feeding them.'"—New York Tribune.

A colony of live beavers will be exhibited in the Canadian section at the World's Fair,

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1903, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, \$75.00.

Second prize, \$50.00.

Third prize, \$25.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1903.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. Photographs of the boat and of the country passed through, not smaller than 4x5, should, if possible, accompany each story, and they will be considered in making the awards.

5. An outline chart of the trip drawn on white paper in black ink (no coloring pigment to be used) should also be sent in.

6. Competitors should avoid the use of slang or incorrect nautical expressions in their stories, as it will count against them in awarding the prizes.

7. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York City, on or before Nov. 15, 1903.

American Power Boat Association.

At a recent meeting of the American Power Boat Association held at the Hotel Navarre, New York city, it was decided to offer for competition next year a cup for power boats valued at \$500. The following gentlemen were chosen to act as a committee to decide what rules should govern the races for the cup and what size boats should compete for it. Henry J. Gielow, Atlantic Y. C.; J. H. Wainwright, American Y. C.; E. W. Graef, Brooklyn Y. C., and A. B. Cole and E. M. MacLellan, Manhasset Bay Y. C.

The association races will begin next season on Decoration Day. The Executive Committee will provide an association pennant.

The secretary stated that the Marine Motor Association of Great Britain had adopted the association table of time allowances.

During the past season the association held races at the Columbia, Indian Harbor, Atlantic, American and Knickerbocker Y. C.'s and that some fifteen other races were held under the association rules.

In the rule for rating gasoline explosive engines the constant for two-cycle engines was changed from 900 to 750. The clause was amended to read as follows:

Gasoline Explosive Engines.—To be calculated by multiplying (A) the area of one piston in square inches by the number (N) of cylinders, multiplied by the stroke (S) in feet, multiplied by the maximum number of revolutions (R) per minute, and divided by a constant (C) of 1,000 for a four-cycle and 750 for two-cycle engines.

New rules were added to the present rule relating to time allowance and endurance contests. They are as follows:

Points in endurance contests shall be scored as follows: Fifty points shall be allowed for speed, and 50 points shall be allowed for performance.

For Speed.—The corrected time shall be calculated in accordance with the rules and tables of allowance. Each yacht making the fastest corrected time in its class shall receive 50 points. Each other yacht, in the same class shall receive the number of points (X) equal to the fastest corrected time in her class, expressed in minutes and decimal fractions (T'), multiplied by 50, and the product divided by such other yacht's own corrected time expressed in the same manner (T)—the formula being:

$$X = \frac{T\ 50}{T'}$$

For Performance.—Fifty points shall be given for perfect performance of motor, which must run from start to finish of the race without adjustment or manipulation of motor, dynamo, batteries, reversing gear, or any part connected with the motive power of the boat, except for purposes of lubrication by means of the usual devices provided for that purpose.

From 50 points the following deductions shall be made: Five points for each stop of motor or propeller for any cause, and in addition thereto.

Five points for each minute or fraction thereof duration of stop or stops.

Two points for each adjustment or manipulation of motor, dynamo, batteries, reversing gear or other mechanism connected with the motive power of the boat, except for lubrication.

Fifty points for any stop of 5 minutes duration, or 50 points for three stops.

Courses or endurance contests shall be so arranged that at least

In the class racing, Dart, owned by Mr. F. H. Stone, was an easy winner. Chubby II., owned by Mr. Lawrence Grinnell, was second, and Lora, owned by Mr. J. F. Knowles, Jr., was third.

The boats are perfectly balanced, carry their sail remarkably well, and go to windward nicely in both smooth and rough water. They have been quite successful in the racing and have furnished the keenest possible sport.

At the New Bedford Y. C. of July 25, the Herreshoff 15-footer of the Beverly Y. C. one-design class, sailed over an open water course against these three boats, and was defeated easily.

Later in the season Mr. Grinnell raced his boat at Marion in the Sippican Y. C. regatta against four of the Herreshoff 15-footers and two other boats of the same size. Two of the Herreshoff boats that were racing in home waters finished first, but Mr. Grinnell's boat easily beat the other entries.

These are the only two events in which the boats of this design competed, but in a number of scrub races they have beaten handily boats of considerably larger size.

A Transatlantic Clipper Service.

A LOVER of the sea has been prompted to write to the daily press, suggesting, in all seriousness, that it would be a profitable and popular move on the part of our leading steamship companies if they were to add to their fleet one or two passenger sailing ships, with a view to affording those passengers who take the transatlantic

15-FOOT. ONE-DESIGN KNOCKABOUT AT ANCHOR.

trip purely for health and pleasure, an opportunity to spend more days upon the ocean than they can enjoy in a trip between America and Europe on a fast, modern steamship. At first blush, the suggestion that we should return to the leisurely speed of the clipper sailing ship, seems almost preposterous; and yet on second thought,

15-FOOT ONE-DESIGN KNOCKABOUT UNDER WAY.

when we bear in mind the wonderful growth of the yachting spirit, as shown by the vast fleet of sailing yachts and steam yachts that covers our waters in the summer season, the idea is by no means visionary; and, indeed, if put into effect to a limited extent, it would probably

15-FOOT WATERLINE ONE-DESIGN KNOCKABOUT—SAIL PLAN—DESIGNED BY WM. H. HAND, JR.

prove to be a very successful venture. To a large and ever-growing percentage of European travelers, the sea voyage is one of the greatest inducements to make the trip. With all our vaunted advance in speed and comfort, there is a question whether we have not sacrificed many of those very features of a sea voyage which tend to give rest to mind and body. The great demand for space for engines, boilers, and coal bunkers has made it necessary to cut down the stateroom accommodation to absurdly narrow limits—so narrow that not the most elaborate furnishings and finish can disguise the fact that the average stateroom is not much more than a stuffy little box in which one is veritably “cribbed, cabined, and confined.” The compensation for many travelers is to be found in the short duration of the passage, and for those to whom time is an object, either for business engagements or to escape the inevitable miseries of seasickness, the cramped quarters are regarded as part of the price which must be paid for high speed. If a clipper sailing ship, however, were designed especially for transatlantic summer travel, it would be possible, in the absence of any provision for steam power or cargo, to give up practically the whole ship to passenger accommodation, and individual state-rooms could easily be made double the size of those usually found on the modern liner. There would be a complete absence of vibration, and of smoke and cinders, and a general steadiness of motion which only those who sail the seas under canvas can properly appreciate. If the ship were built with modern speed lines, it should be able, under favorable circumstances, to make the eastward passage in from twelve to fifteen days. The westward passage would, of course, take longer; but as the travelers on such a ship would be taking the trip largely for the sake of the sea voyage, a three or four weeks’ journey would be looked upon rather with favor than with regret. Such a vessel would be fitted with every luxury that is to be found on the modern liner, and the absence of engine-room skylights and smokestack openings, would render it possible to provide magnificent promenades extending the full length of the vessel and almost entirely free from obstruction. The experiment is surely worth a trial on the part of one of the more wealthy companies; for it would be somewhat in line with that most successful venture of the German companies, in building steam yachts of slow speed exclusively for yachting cruises of many weeks’ or months’ duration. —Scientific American.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

At the annual meeting of the South Shrewsbury Y. C., the following were elected officers: Com., Benjamin P. Morris; Vice-Com., Charles P. Irwin, of Red Bank; Treas., J. W. Edwards; Captain of Fleet, Wm. R. Joline; Regatta Committee—James Throckmorton, Warren Snyder, George Lippincott, J. J. Manolt; Meas., William P. Taber.

The Indian canoe Tilakmuni, which left Victoria, B. C.,

to tour the world with a lone mariner, J. C. Vose, and which made the trip to Australia, has been reported in letters from Vose dated at Tanu, New Hebrides, on September 9. He is en route to Thursday Island and to Africa, whence he will cruise to London.

The annual meeting of the Jamaica Bay Y. C. was held on Saturday evening, October 31. There were two tickets in the field. The opposition was not against the re-election of Commodore Joseph F. Sabin, or E. V. Pardessus, Chairman of the Regatta Committee, but affected minor offices. The regular ticket won out by a majority of four. The officers elected follow: Com., Joseph F. Sabin; Vice-Com., P. M. Oldner; Rear Com., James T. Johnston; Fleet Captain, P. M. Schaffer; Treas., A. C. Christopher; Chairman of the Regatta Committee, E. V. Pardessus; Chairman of the House Committee, W. H. Christopher; Chairman of the Membership Committee, C. V. Dykeman; Chairman of the Entertainment Committee, Dr. Charles Pfug; Directors—B. F. Daly, J. E. Lent, and W. J. Moran; Record. Sec’y, L. W. O’Connor; Finan. Sec’y, E. B. Palmer. The reports of the officers and chairmen of committees showed the club to be in excellent condition. There is some talk of establishing a class of one-design boats of 22ft. waterline length.

Alterations and additions are to be made to the home of the Indian Harbor Y. C. The contract has been let, and the work will be commenced at once. The present building at Rocky Point will be raised and a large billiard room, kitchen, ladies’ reception room and porches and terraces on the east and west sides will be added. The improvements will cost about \$12,000.

At Joseph Montell’s yard at Greenwich, Conn., there are building five one-design boats for Mr. Henry M. Flagler. The boats were designed by Mr. Morgan Barney, and will be used at St. Augustine, Florida. These craft are 18ft. on the waterline, and as soon as they are completed they will be shipped south.

Capt. Joseph N. Nelson, whom yachtsmen remember as the pilot of the Genesta when she raced the Puritan in 1885 for the America’s Cup, died at his home at Staple-

Gravesend Bay Y. R. A.

During the past season the Y. R. A. of G. B. gave eight races, in which there was a total of thirty-five starters in all classes, including the outside boats entering the special series, of which there were five. Regular series prizes for the year went to Bonito, Squaw, Ogeemah, Spots, Martha M. and Esperance.

Second prizes, two-thirds the value of the firsts, were given to the winners of the second greatest number of points in classes where there had been three entries in at least five, or the majority of the eight events. The winners of second prizes were Karma, Rascal and Kelpie. Prizes for winners of the greatest number of points in the series of three special races went to Adeline, Ogeemah, Spots, Martha M. and Esperance.

In each class competition was interesting. Bonito and Kangaroo sailed but the first five races in special class M, cruising trim. The former finished first in each race. Squaw won out in the fight for the series prize in sloop class N.

In class P, Ogeemah entered and finished every event, with no sailovers, a record held by no other boat during the season. Esperance would have had an equally good record but for an accident by which she lost her iron centerboard and was forced to withdraw.

This was in the race of August 29. Her opponent, Kelpie, with which she was running neck and neck for first series honors, gracefully withdrew and towed the disabled boat back to her moorings. Acts of courtesy like this are splendid to look back upon after a season of good competition. Karma started in all but one event of the year and finished second in the series.

Spots was excellently sailed and started in every race. Her principal opponent, Trouble, was in Gravesend Bay waters only a part of the season. Flying Fish was sold out of the bay early in the campaign.

No boat in class R entered enough races to win a series prize. Sandpiper would have done so had not she, with a great many other craft, been put out of commission by the disastrous gale of Thursday, September 17. This storm did great damage to the pleasure yacht fleet

on Gravesend Bay and materially affected the entry in the last association race, which took place on the Saturday following. Apukwa II. was the other chief contender in class R.

The struggle among the catboats was again of a most interesting nature. Each entered seven races. Rivalry was hot and competition good. Martha M. won. This boat has taken first honors in her class ever since the association was formed. Rascal was second.

Esperance, Kelpie and Jig-a-Jig were the chief contenders in the Marine and Field one-design class. The sail area of the three was raised to the limit of the original spars and speed was increased thereby. Esperance was handled in an expert manner and performed well from the beginning of the season until the end.

Another craft worthy of especial comment is the class R boat Sandpiper, a Herreshoff creation, admired by every one who saw her.

The newcomers in the races of the year were Bobtail, Bagheera, Vivian II., Folly, Smoke, Cicada, Sandpiper, Apukwa II., and Trio.—Brooklyn Eagle.

s, Sail over. d, Disqualified. —, Did not start. D, Did not finish. * Disqualified once.

Races held under auspices of following clubs: June 6 and July 25, Marine and Field Club; June 20 and Aug. 1, Brooklyn Y. C.; June 27 and Sept. 4, New York C. C.; Aug. 29 and Sept. 19, Bensonhurst Y. C.

In system of points used a boat gets 1 point for starting and finishing a race and 1 for every craft she defeats. Sailovers count 1 point. The special series was open to boats of all yacht clubs.

Boston Letter.

BOSTON, Nov. 8.—Racing rules are absorbing the attention of the yachtsmen to such an extent, at present, that the work of putting up new boats for the popular classes is progressing very slowly in the shops. Many of the designers have received orders for yachts in the restricted classes, and there are many who have provisional orders for designs practically closed; but with the advent of new classes and new rules, those who otherwise might have placed orders for new boats long ago are a bit desirous of finding out as much as possible of what the other fellow is doing before taking the final steps. Mr. E. A. Boardman has orders for two 15-footers in the new class, and it is believed that Messrs. Burgess and Packard have orders for one or more in the same class, but the orders for new boats are coming slowly. Rear Commodore Walter Burgess, of the Boston Y. C., is to have a boat for the new 21ft. class, but no others have been heard from officially as yet.

It is not known that any orders for new boats for the 30-rating class have been actually placed yet. It has been deemed advisable to go over all of the restrictions made for this class with a view of making them more strong before asking yachtsmen to go into it. It is quite likely that in a short time the rules will be completed so that yachtsmen may build with assurance of protection. In this class, as with the new 21-footers and 15-footers, both designers and prospective owners are studying the conditions carefully, with a view to speed possibilities in different types, before turning out anything definite. New classes and new rules are always greeted by Massachusetts yachtsmen with more or less suspicion, and, while they might vote to adopt them, it usually takes some time before they commence to show any enthusiasm in a practical manner.

A movement is on foot at present to establish a one-design class of 18ft. knockabouts, which is expected to be raced in the vicinity of Marblehead. While this is intended to be essentially a one-design class, it is proposed to have the boats conform to the restrictions of the 18ft. Knockabout Association, and the boats may race in open events for the class given under the rules of that Association. Some of those interested in the present 18-footers look askance at the proposal of a one-design class under their rules, taking the view that such a move would tend to split up the greater class. There is nothing in the rules governing the 18ft. class which would prevent the building of any number of boats of one design under its rules, but if such boats are to be raced chiefly in one spot, it would seem that the theory of a possible splitting up of the class would be tenable. One-design classes have never been prosperous in Massachusetts waters, and it is not likely that they ever will be, for a one-design class must necessarily be raced in one place to hold its interest, and enthusiasm in yachting runs too high in Massachusetts to make this possible for any length of time. The passing of the raceabout class is a very good example of this.

There has always been much contention in Massachusetts Bay between the keel boat men and the centerboard men. Each has claimed, and especially in recent years, that the other has been getting the best of the bargain under the rules. In the new classes that have been recently adopted by the Yacht Racing Association of Massachusetts, this question has again been brought up. It is the claim of one yachtsman, who has figured out plans for the new 15ft. class, that the rules tend to produce a scow, and that such a boat will have the advantage of a centerboard boat. It may be true that a scow would be preferable, but it might be that those preferring the straighter lined boat would be only a part of the whole. The same contention was made in the 25ft. class. Three immense centerboard scows were built, but Mr. Fred Lawley showed that the scow form in a keel boat had its advantages also when he produced Sally VII., unquestionably the fastest boat in the class. When the 22ft. class was brought out last spring the same claim was made, but although a keel boat won the championship, the question of advantage of type has not been definitely settled yet. So, in the new classes, the question can only be decided by much actual racing, and perhaps not even then.

Mr. E. A. Boardman has turned out the lines of a very nice looking keel 18-footer for Hon. Charles Francis Adams 2d, which is intended to be the boat for the proposed new one-design class. He has also orders for two 15-footers, and a 21ft. and a 26ft. cruiser to go south during the winter. The 18-footer of his design for Mr. John W. Olmstead, of the Boston Y. C., has been laid down at the shop of Shiverick, of Kingston.

Messrs. Small Bros. have an order for a 57ft. gasoline launch for Mr. C. H. Kelley, of the Winthrop Y. C. This boat is remarkably well laid out, giving the maximum of room. She is cut up in such a manner as to make her very desirable for cruising, and she is expected to turn up a fair amount of speed.

At the Marblehead yacht yard, Stearns & McKay, the following yachts are hauled out: Auxiliary yacht Katherine II., F. W. Rollins; America, C. W. Sherburne; 46-footer Barbara, Robert Treat Paine 2d; sloop Vandal, B. B. Crowninshield; auxiliary yawl Umbrina, built here last winter for J. P. Elton, Waterbury, Conn.; Ranger, Henry P. King; Shona, C. H. Tweed; Heron, W. I. Badger; Golden Rod, George E. Bruce; Intrepid, Henry A. Church; Scud, C. P. Curtis; Wyvern, R. K. & A. W. Longfellow; Nautilus, J. D. Crosby; Tanager, C. W. Foss. Among the smaller yachts in the sheds are J. Murray Forbes' 35-footer Hostess, which has been sold to R. G. Shaw; Judge William Caleb Loring's Venire, C. H. Tweed's Rob Roy and Runaway Girl, G. A. Gibson's Nordlys, C. L. Eaton's Kiowa, W. P. Fowle's Sintram, Dr. Franklin Dexter's Grig, W. H. Stuart's Nameless, Frank Gair Macomber's Chewink III., Dr. W. T. Porter's Nyssa, C. H. Gibson's Dorothy, E. S. Webster's Hurry, Frank Brewster's Suzanne, F. E. Peabody's Chickadee, F. P. McQuesten's Gem, L. C. Wade's Apache II. and many others.

JOHN B. KILLEN,

Challenge for Lysistrata Cup.

MR. GEORGE A. CORMACK, secretary of the New York Y. C., has received notice from Mr. H. H. Rogers, owner of the steam yacht Kanawha, that he has received a challenge from Mr. F. M. Smith, owner of the steam yacht Hanoli, for a race for the Lysistrata cup. The cup was competed for last summer for the first time in American waters. There were only two starters in the contest, which was won by Kanawha. If Kanawha should win the second race for the cup it will become the property of the winner. The race will take place one week before or after the New York Y. C.'s regatta next June, which is one of the conditions governing the cup. The course, which must be at least fifty nautical miles in length, can be selected by the present holder of the trophy.

The race for the cup last summer between Kanawha and Noma took place off Newport, and the boats covered a sixty knot triangular course. Kanawha covered the distance in 3h. 3m. 9s., and Noma in 3h. 8m. 5s., the former winning by 4m. 56s. The average speed of Kanawha was 19.67 knots an hour, and Noma 19.09 knots an hour.

Hanoli was designed by Mr. Henry J. Gielow and built last winter by the John N. Robins Company, South Brooklyn. She is 211.3ft. over all, 166ft. waterline, 21.6ft. breadth, and 9ft. draft. She is a single-screw vessel and has triple expansion engines, with four cylinders, of 17in., 26½in., and two of 30in. in diameter by 21in. stroke, and is fitted with four Almy boilers. She is of 203 tons net.

Kanawha, which is the larger boat of the two, was designed and built by the Gas Engine and Power Company and Charles L. Seabury Company, in 1899. She is 227ft. over all, 192ft. waterline, 24.4ft. breadth, and 11.6ft. draft. She has twin screws and her engines are of the triple expansion type, with six cylinders, two of 14½in., two of 24in., and two of 42in. diameter by 24in. stroke. She is equipped with four water tube Seabury boilers. She is 323 tons net.

Launch Vingt et Une Establishes Speed Record.

THE 30ft. launch Vingt et Une established some new speed records on her trials on the Hudson River off Yonkers on Nov. 5. After covering a measured mile against a strong wind and tide in 3m. flat, she ran a mile with the wind and tide in 2m. and 26s., or nearly at the rate of 25 miles an hour. This speed is believed to be the fastest ever made by a boat of her size, and she will no doubt exceed it, as this was her trial trip. Vingt et Une was designed by Mr. Clinton H. Crane, of Messrs. Tams, Lemoine & Crane, and was built by Thomas Fearon at Yonkers. She is 30ft. long and just under 4ft. breadth and is built of mahogany. The boat is fitted with a Smith & Mabley four-cylinder 21 horse-power motor. The total weight of the boat and the engine is 770 pounds. The tanks have a capacity of 25 gallons of gasoline, which is sufficient fuel to drive the boat 300 miles. One man can easily run the boat, and she can accommodate five passengers.

Rifle Range and Gallery.

Individual Rifle Championship Match.

THE Individual Rifle Championship Match, which has been one of the annual Election Day fixtures with our New York riflemen since 1893, was held this year on Tuesday, Nov. 3, in Armbruster's Greenville Schuetzen Park, Jersey City, N. J. This annual contest has become very popular with our local riflemen. It is now one of the fixtures among many rifle clubs throughout the country. The first inception of this annual match was brought about with the idea of closing the out-door shooting season with a grand meeting of all the best marksmen in and about New York, and in the results demonstrate who was the champion for the year. The conditions of the match are of such a character that the middle class shooter would be induced to enter the contest. The management of this event has, up to 1901, been in the hands of prominent local riflemen. This year the famous Zettler Rifle Club, of this city, was induced to take it up and make it one of its annual club fixtures. So, under the leadership of Gus Zimmermann, the president of the Zettler club, the contest was one of the most successful in its history.

Conditions: 100 shots per man, 25-ring target (3/4 in. rings). Open to all comers. Entrance \$5. Distance 200yds.

A trophy, emblematic of the championship of the 100-shot matches, donated by Wm. Hayes, of Newark, N. J., is to be held by the winner for one year, the names of the winners to be appropriately inscribed on the trophy each year, from the time of the inauguration of the 100-shot champion matches.

A fine trophy, donated by Wm. Armbruster, for the best 10-shot score. Only one trophy or one prize can be won by one competitor.

The match will be shot under the management of the following committee: Gus Zimmermann, Chairman; Wm. Hayes, M. Dorrlar, L. P. Hansen, E. Van Zandt, O. C. Boyce, A. Begerow, C. G. Zettler, B. Zettler, Aug. Kronsberg, R. Gute; Geo. W. Plaisted, Secretary.

The records of the winners in previous years follow:

1893, 100-shot score: F. C. Ross, 2194; 10-shot score: L. Flach 230, and Chas. Hutch 230.

(Shoot-off won by L. Flach.)

1894, 100-shot score, F. C. Ross 2142; 10-shot score, F. C. Ross 231.

1895, 100-shot score, F. C. Ross 2222, 10-shot score, G. W. Plaisted 233.

1896, 100-shot score, F. C. Ross 2225; 10-shot score, M. Dorrlar 230.

1897, 100-shot score, M. Dorrlar 2183; 10-shot score, H. M. Spencer 229.

1898, 100-shot score, F. C. Ross 2213; 10-shot score, H. M. Spencer 231.

1899, 100-shot score, M. Dorrlar 2246; 10-shot score, Geo. Schlicht 231.

1900, 100-shot score, M. Dorrlar 2257; 10-shot score, F. C. Ross 225.

1901, 100-shot score, F. C. Ross 2238; 10-shot score, Dr. W. G. Hudson 230.

In the match this year the conditions in every way were favorable. The weather was clear and warm, with little or no wind. The entry was large, twenty-nine riflemen being recorded on the entry list. Four States were represented by their most expert riflemen—New York, New Jersey, Pennsylvania and Massachusetts.

The highest record score, 2257, that had ever been made with the schuetzen rifle on the German ring target in any country was made in this match by Michael Dorrlar on the Greenville range in 1900. But in the contest on the same range, Nov. 3, Dr. Walter G. Hudson made a score, 2301, that most every rifleman has considered impossible, and would never be made. His entire 100 shots averaged inside of a 4 1/2 in. circle at 200yds., shooting off-hand or hip rest. This score is 76 points higher than that of his nearest competitor, J. E. Kelley, who had a total of 2225 points. Dr. Hudson won the Hayes trophy. J. E. Kelley won the Armbruster trophy, a diamond locket, presented by Wm. Armbruster.

The scores of the match follow, Dr. Hudson's score being given in full:

Dr. W G Hudson, N Y City.	22 23 23 25 24 21 22 20 25 23—228

Rifle Shooting at Flying Objects.

SHOOTING at flying or moving objects with a rifle is increasing in popularity, and several noteworthy performances in this line have occurred recently.

Prominent among those who have achieved success in this direction is Le Roy Leach, whose performance at Wood Lake, Neb., on Aug. 2, was claimed at that time to be the world's record in that line of shooting. Mr. Leach shot at 1 1/4 in. wooden blocks, thrown into the air by two assistants. He used a .22cal. repeating rifle and a single bullet. The targets, 1,000 in number, were thrown by W. L. Chrysler and E. Tryon. One rifle was

MR. LEROY LEACH.

used throughout the shooting, which was fitted with plain open sights. The score made was as follows:

Shot at.	Broke.	Missed.
50	48	First 2
50	47	First, and last 2
450	448	Last 2
450	447	First 3
1000	990	10

This performance was duly witnessed, and its correctness sworn to before a notary public. Excellent though it was, it did not satisfy Mr. Leach, who essayed to hit 1,000 targets straight. On Oct. 14 he attempted and accomplished this remarkable feat. It was also done at Wood Lake. Mr. Leach shot at the same 1 1/4 in. targets at a distance of 20ft. He used a repeating rifle.

This shooting was witnessed by I. J. Leach, Oliver Hall, A. S. McNamee and C. E. Dennis, who made affidavit as to its correctness, which was sworn to before A. C. Johnson, a notary public at Wood Lake, Neb.

Mr. Leach is country surveyor of Cherry county, Nebraska. Shooting with him is a mere pastime, and his performance on Aug. 2 was his first attempt to make a world's record.

Kaufmann vs. Young.

Two of the Williamsburg sharpshooters who have been at odds for some time over their respective shooting ability, with the aid of their friends as promoters in the matter, arranged a 100-shot match for \$50 a side. The match was shot off on the Glendale Park range, at Glendale, L. I., last week. Kaufmann won by 128 points. Conditions, rifle, 200yds. The scores are appended:

John Kaufman	22 15 15 24 18 15 19 11 14 19—172
	21 21 18 25 18 21 22 21 24 20—211
	24 25 23 20 23 19 22 18 24—221

Cincinnati Police Revolver Contest.

FOLLOWING are the winners in the police revolver competition, Cincinnati, O., which was concluded on Nov. 2: First, Sergt. Chas. Palmer, 57; second and third Patrolman Jacob Sterley and Allen Moore, 53 each; fourth, Sergt. Wm. White, 51; fifth and sixth, Patrolmen Wm. Moore and John Muhle, 48 each. The conditions were six shots each at a 10in. target, 3in. bullseye, 60ft. distance, possible 60 points. The prizes were silver medals, given by Col. Millikin, Chief of the Department, and were made to represent the target, each man's score to be engraved thereon.

Rifle Matters.

THE long delayed question of the future management of the Union Hill Park, was finally decided last week, when the executive board of officers of the Plattdeutsch Verein voted to lease the park to Capt. John Moje, of Fifty-ninth street and Lexington avenue.

The New York Corps will open its winter gallery shoot for prizes on the Zettler Bros. ranges on Friday night, Nov. 13.

Hudson vs. Dorrlar.

DR. W. G. HUDSON, of New York city, and Michael Dorrlar met on Armbruster's Greenville range, Jersey City, on Oct. 30, and had a 50-shot match for a small stake.

The weather conditions were good, and both of the men made good scores. Dr. Hudson finished 12 points in the lead. Scores:

Hudson	24 24 24 25 24 21 18 24 21 23—228
	21 25 21 21 23 23 21 21 20 23—219
	25 23 19 22 25 22 19 21 24 22—222
	24 22 23 23 24 24 22 25 25—233

Manhattan Rifle and Revolver Club.

NEW YORK.—The Manhattan Rifle and Revolver Club held its weekly shoot in the Greenville Schuetzen Park on Saturday, Nov. 7. Several good scores were made on the revolver range.

B. F. Wilder made one score of 97.

Revolver scores, 50yds.:

B F Wilder	91 97 85 95 89 94 84 89 91 80
W J Coons	85 89 86 86 87
A L A Himmelwright	89 91 89 88

Rifle scores, 200yds.:

H Fenwirth	23 21 23 20 23 19 18 18 20 18—203
L P Hansen	21 19 21 23 18 22 23 23 24—217

Cincinnati Rifle Association.

CINCINNATI, O.—On Oct. 25 the following scores were made, shooting at 200yds., offhand, 25-ring target:

	Honor.
Payne	64
Nestler	63
Lux	60
Bruns	54
H Uckotter, Sr.	66
Gindele	192
Freitag	192
Drube	196
H Uckotter, Jr.	143

Presque Isle Rifle Club.

ERIE, Pa., Oct. 31.—In spite of the pleasant weather last Saturday only four of the club turned out for the weekly shoot. Capt. Bacon, who hardly ever misses being present, was out of the city to-day. Scores:

Parker	79 77 74—230
Almeda	68 66 64—198
Germann	84 77 76—237
Mount	82 74 73—229

CABIA BLANCO.

Miller Rifle Club.

HOBOKEN, N. J.—At the weekly gallery shoot of the Miller Rifle and Pistol Club, at headquarters, 123 Washington street, Hoboken, last week, the appended scores were made, .22cal. rifles, offhand, distance 75ft.: C. Bischoff 245, F. Unbehunen 243, C. Smith 241, R. W. Evans 240, R. A. Goldsmith 239, A. Schwartz 238, C. Miller 234, P. Schultz 231, E. Doyle 228, W. Grote 217, C. Bayha 215, D. Dingman 232, A. Bahn 229, R. A. Blake 220, C. Kensey 216.

Trapshooting.

Fixtures.

Nov. 18.—Ossining, N. Y., Gun Club shoot; main event, 100-target handicap for silver chocolate set.

Nov. 21.—Brooklyn, N. Y., Gun Club shoot, 100-target allowance handicap; \$5 to high guns. J. S. Wright, Mgr.

Nov. 26.—Chicago, Ill., Gun Club Thanksgiving Day shoot. A. A. Waters, Sec'y.

Dec. 9-10.—West Baden, Ind.—Baden-Lick Club amateur live-bird shoot. J. L. Winston, Mgr.

DRIVERS AND TWISTERS.

We are informed that the Young Repeating Arms Co., of Columbus, O., have discontinued.

Mr. J. L. Winston announces that Dec. 9 and 10 have been fixed upon for an amateur live-bird shoot of the Baden Lick Club.

Mr. H. Sauer, of the firm of J. P. Sauer & Son, Suhl, Germany, arrived in New York on Tuesday of this week. He will remain in the United States for some weeks.

Mr. Frank Lawrence, representative of the W. R. A. Co. in Pennsylvania, was in New York on Wednesday of last week en route to visit the factory at New Haven.

Mr. Tom Marshall arrived in New York on Tuesday of this week, after a day's shooting on the Chesapeake Bay. He bagged seventeen canvasbacks. He was the guest of Mr. Dupont, president of the Dupont Powder Co.

Mr. John S. Wright, manager, announces that the Brooklyn Gun Club will hold a shoot on Nov. 21, commencing at 1 o'clock. The main event will be an allowance handicap at 100 targets, for a gold watch, 50 cents optional entrance, targets extra; \$5 to high gun.

Eminent visitors in New York last week were Messrs. Irby Bennett, of Memphis; Tom Marshall, Keithsburg, Ill., and W. L. Colville, recently of Batavia, N. Y. Mr. Marshall left southward on Saturday last for the section of the Atlantic Coast where the canvasbacks abound.

In the contest for the Traver cup at the shoot of the Poughkeepsie, N. Y., Gun Club, Nov. 5, Mr. H. E. Winans won with a straight score of 25. This is a handicap event. The Poughkeepsie gladiators contemplate an invasion of Ossining on Nov. 18, with a renewed purpose to lift the cup.

Mr. C. G. Blandford informs us that the Ossining, N. Y., Gun Club will hold a shoot on Nov. 18, commencing at 1 o'clock. The main event will be a 100-target handicap, misses as breaks, for a chocolate set, value \$25. This will also constitute five 20-target optional sweeps for amateurs. A \$10 gold piece will go to the one who scores the greatest number of breaks out of the 100 targets, \$1 optional entrance extra.

The series of matches between ten-man teams of the Annapolis Gun Club and the Annapolis Gun Club, of Washington, D. C., resulted in a tie. Three contests were decided. Annapolis won the first by a score of 393 to 386. The second contest resulted in a tie on 365. Annapolis won the third contest by a score of 414 to 406. Each man shot at 50 targets. The final match is postponed till next spring.

Mr. Thomas Johnson, of Winnipeg, Man., under date of Nov. 1 writes us as follows: "We are having great shooting in Manitoba this year. Ducks and geese were never so plentiful, and our weather at present is like summer. I am beginning to think that the universe is turning round, or that 'nature' is getting generous and thinks we should have a fair share of the good weather that she distributes."

Mr. J. G. Ewing, of the Lafin & Rand Powder Co., writes us as follows: "Owing to the death of J. A. Graham, universally known as Uncle Jack, who has been the Lafin & Rand representative at Phillipsburg, Pa., for many years, Mr. Howard Sergeant has been recalled from Chicago, and will take up his residence at Phillipsburg. Mr. Sergeant is very favorably known in Mr. Graham's territory, and his many friends will welcome him back."

Mr. Geo. A. Airey, of Morgan Park, Ill., a suburb of Chicago, was murdered on the evening of Oct. 31, while shadowing a party of disorderly negroes. One of the latter, after arrest, confessed to the murder. A deep cut in the neck was the cause of death. Mr. Airey was a game warden and head of the Morgan Park Police. He was a few years since one of the most active and skillful trapshooters of Chicago.

The communication of Bonasa, published in our trap columns, presents in sharp contrast the ideas of sport prevailing many years and the ideas of sport which prevail in the present. The pernicious side hunt was then popular, but in the beginning of things, one should not expect too much. The side hunt, with many other free-and-easy customs, is now obsolete. The article is specially valuable as showing the ideas and doings of old-time sportsmen.

At Millbrook, N. Y., in a contest for the gold medal emblematic of the county championship, between Mr. A. Traver, challenger, and Mr. F. B. Stevenson, defender, and Messrs. G. G. Stevenson, Tallman, Perkins and Adriance as co-contestants, Nov. 6, resulted in a victory for Mr. W. A. Adriance on a score of 94. Mr. Traver scored 92, Mr. Tallman 91, Mr. G. G. Stevenson 86, Mr. F. B. Stevenson 85, Mr. Perkins 84.

BERNARD WATERS.

Ossining Gun Club.

OSSINING, N. Y., Nov. 7.—The wind played havoc with the scores of the Ossining Gun Club to-day. The targets were "roasted." A new boy scorched on the magautrap, while Old Boreas cut loose from the north. I am ashamed to show the scores without doctoring them a little; but here goes.

Please announce in your "Fixtures" column that a 100-bird handicap, misses as breaks, will be held here on the 18th inst, 1 P. M. sharp, entrance price of birds, at 2 cents, for a \$25 silver chocolate set. Five 20-bird optional sweeps for amateurs will be included; also a \$10 gold piece for the greatest number of breaks out of the 100 targets; \$1 entrance extra; this is also optional.

Have already enough pledges to assure a good turnout. Open to all.

Hubbell got another win for the rifle and telescope to-day, winning on a shoot-off with Ball and Clark.

Events:	1 2 3 4 5	Events:	1 2 3 4 5

No. 5 was from Zlyd. mark.

C. G. B.

Millbrook Gun Club.

MILLBROOK, N. Y., Nov. 6.—The grounds of the Millbrook Gun Club to-day were the scene of as pretty a fought race for a gold medal and a county championship as one could wish to see. The race was instigated by Mr. A. Traver, challenging Mr. F. B. Stevenson to a match several weeks ago, at which time Mr. Stevenson had won the medal and title; and while this was a match between these two gentlemen, it was at the same time an open event for any man in the county wishing to compete. Six men competed to-day, and while Traver defeated Stevenson, Mr. W. A. Adriance, of the Poughkeepsie Gun Club, was too much for "the whole shooting match," and carried off the honors. As will be seen by the scores "Old Reliable" Tallman was on deck and gave them "a run for their money." The race was at 100 targets, in four events of 25 each.

Events:	1 2 3 4	Events:	1 2 3 4
Targets:	25 25 25 25	Targets:	25 25 25 25

Perkins	19 24 20 21—84	Tallman	22 22 23 24—91
Adriance	24 23 24 23—94	F. B. Stevenson...	21 21 22 21—85

W.

Imperial Gun Club.

CALAMUS, Ia., Nov. 6.—Owing to a light attendance, what was to have been a two-days' tournament of the Imperial Gun Club closed to-day. Owing to a hill for a background, the targets were hard to locate, and the scores ran low. Lord, Whitney, Budd and Adams were present. Budd and Lord shot through to-day's programme for targets only. Budd was high, with 201; Shaddow, of Calamus, second, with 189.

Events:	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Broke.

HAWKEYE.

Chicago Gun Club.

CHICAGO, Oct. 31.—The closing shoot of the Chicago Gun Club took place to-day.

The conditions were 100 targets, \$2 entrance, optional sweep. The scores: Parker 75, Dr. Morton 78, Moore 23, Weart 57, Bowles 71, Willard 91, W. Stannard 93, C. P. Richards 74, Myrick 85, O'Brien 86.

Mrs. Howard shot at 75 and broke 50. Dr. Burcky shot at 25 and broke 13.

The winners of the annual prizes were: First, Lem Willard, L. C. Smith Gun; second, W. D. Stannard, Remington gun; third, "Oliver O'Brien," prize valued at \$20; fourth, C. P. Zacher, Bristol steel rod.

The club will hold a special holiday shoot Nov. 26, Thanksgiving Day.

Franklin (Ohio) Gun Club Tournament.

THE fall tournament of the Franklin Gun Club was held on Nov. 4 and 5. The club's grounds are very conveniently situated, being easily accessible by steam or street railway. The club has a very comfortable house, and its grounds are well arranged.

The attendance on the first day was exceedingly good, considering the weather, which was distinctly disagreeable, a strong, cold wind blowing and a drizzling rain falling. Twenty-four shooters faced the traps, fourteen of whom shot the entire programme of 160 targets, and doing some very good work. R. Trimble was high man, with a score of 152, breaking straight in five out of the ten events, and losing but 2 in the last 125 targets shot at. Ahlers was second, with 147, and Phil third, with 143.

Trimble gave an exhibition of shooting with his automatic rifle. The second day was cold, raw and disagreeable, with a strong wind blowing, and the attendance was very much reduced, only thirteen staying to take part in the sport. Of these, eight shot in all events, at the same number of targets as on the first day.

Phil was high gun, with a score of 151, and made a run of 84 straight breaks, a good record under the poor weather conditions. Kirby was second with 146, and straight scores in three of the events. Lindermuth, third, with 144; Trimble fourth, with 141.

In event No. 7 an error was made by the scorer which reduced Trimble's score by 1, and put him second in the general average instead of a tie with Phil. One of his targets was mistakenly called lost by the referee. He saw his error at once and called "dead," but the scorer had credited Ralph with a big 0, and on hearing "dead" called, gave the next shooter credit, and continued, one shooter ahead on his squad card, until several shots had been fired, before his mix-up was discovered. The error was not corrected on the score sheet, but was known to Phil and several of the shooters present.

Mrs. F. R. Evans, wife of Dr. Evans, is an enthusiastic sports-woman, and has lately taken up trapshooting. She did not shoot in any of the programme events, but at practice broke 10 straight standing at 14yds. She also broke 14 out of 16.

Gambell unfortunately broke his gun, and was obliged to shoot a strange one, which had a bad effect on his score.

The officers of the club are R. C. Wolfe, President; Oscar Shafer, Secretary; F. S. Dial, Treasurer.

Shafer did the office work, and kept everything running smoothly in that department. Dial looked after the comfort of the visitors, and made every one welcome, and attended to all the small details, beside which he shot the programme through.

The club proposed to furnish lunch for the shooters, and did so, but not as they had planned, as their cook disappointed them. President Wolfe came to the rescue, and did the cooking, finding time to shoot in a few events each day. The boys say he's all right, as a cook or a shooter.

Entrance was at the rate of 10 cents per target. Money divided 40, 30, 20 and 10. The scores follow:

Nov. 4, First Day.

Events:	1 2 3 4 5 6 7 8 9 10	Shot

Van Horn 15 10	30	25

General averages, 320 targets: Phil 294, Trimble 293, Lindermuth 286, Kirby 283, Miller 280, Gambell 279.

BONASA.

Cincinnati Gun Club.

THERE was a large attendance at the grounds on Nov. 7, twenty-four shooting in the cash prize event. Two sets of traps were used, and a number shot for practice while the main event was under way. Several visitors were also present as spectators. The day was clear and bright at first, but the sky clouded over the latter part of the afternoon, making the shooting somewhat difficult, and the coolness of the air made the club room a very acceptable place when not at the score.

For the first time in many weeks Phil was at the grounds. He stayed only long enough to shoot in the prize event, and finish high gun with 47 out of 50. He is going to visit Chan Powers, of Decatur, Ill., and the two will take a trip to the Kankakee marshes after ducks.

Barker was second high with 42. He is a very consistent shooter and will surely be in the first flight when the series closes. His son, a boy of twelve years, was with him to-day and shot at a few targets. The showing he made indicates that he will hit his father's gait before he is much older.

John Falk's son, about fifteen years old, and as fond of outdoor sports as his father, was thrown from a horse and his leg broken just above the ankle.

Bob is going after quail soon, and has a nice 20-gauge to use for that purpose. To-day he was practicing at targets, using Lutie Gambell's 20-gauge.

Considerable practice shooting was indulged in. A squad of six tried a few from the 23yd. mark. The targets look pretty small at that distance, and they do travel fast. As a wind-up a few doubles were shot. Shooting at 6 pairs Medico broke 6, Norris 5. At 5 pairs, Herrick 4. At 3 pairs, Frederick 4, Hobart 1.

The scores of the cash prize shoot, 50 targets, follow: Herman, 17yds., 33, Faran, 16yds., 38; Bob, 16yds., 23; Harig, 16yds., 31;

Jay Bee, 17yds., 34; Medico, 18yds., 39; Williams, 18yds., 41; Barker, 19yds., 42; Maynard, 18yds., 35; Gambell, 19yds., 35; Block, 20yds., 30; R. Trimble, 21yds., 40; Sunderbruch, 19yds., 40; Captain, 17yds., 28; Merkel, 16yds., 27; Hake, 16yds., 20; Smith, 17yds., 32; Phil, 16yds., 47; Hobart, 16yds., 32; H. M. Norris 16yds., 36; Dolly, 16yds., 18.

Hamilton (Ohio) Gun Club.

THE fall handicap tournament of the Hamilton Gun Club was held on Nov. 5 and 6, and was fairly well attended. The club has fine grounds a short distance from town. The traction cars pass within a couple of minutes' walk of the entrance. The traps are placed on the edge of a large, perfectly level field, and the score is laid out with cinder paths and marks from 15 to 25yds. There is a perfect sky background, which is unbroken except that extreme left-quartering targets show against a large tree, and are rather hard to see. There is a comfortable house, and the big stove was a favorite piece of furniture on these days. Messrs. Cass and Schumaker, of the committee, attended to the duties of their position, and looked after the welfare of the club's guests in a way which left nothing to be desired. The secretary of the club, Mr. J. C. Haman, filled the positions of puller, scorer and cashier, and five minutes after the close of the last event was ready to pay each winner. Everything worked smoothly during the two days, and the affair was a decided success.

The chicken dinner, furnished by the club, was thoroughly enjoyed by all, the pumpkin and custard pies, "like mother used to make," being especially commended by Hood Waters and Phil, neither of whom care for pie, as they remarked after the disappearance of their third or fourth piece.

The programme called for 175 targets on each day, entrance at the rate of 10 cents per target, and money divided 50, 30 and 20 per cent. in the 15; 40, 30, 20 and 10 in the 20, and 35, 25, 20, 15 and 10 in the 25-target events. The high average money consisted of ¾ cent for every target shot at, and was divided 50, 30 and 20 per cent.

The trade was well represented by Messrs. R. Trimble, Hood Waters, C. W. Phellis, T. De W. Priddy, Frank See, and M. Lindsley.

The first day was dark and cold, and but thirteen shooters were present. The shooting began late in the forenoon, and it was found impossible to finish the ten programme events, the last two being postponed until the second day.

Event No. 8 was at 25 targets, open to ladies, residents of Ohio, only. The club guaranteed the entrance of one of its members, and Mrs. Ayres was on hand to compete. There being no other entry, she shot with her husband, defeating him by a score of 23 to 22.

Conrad was high gun for the day with 155; Hood Waters second, 153; Parker, third, with 148.

The second day was clear and cool, with a strong wind blowing across the traps. The attendance was a little better than on the previous day. At 4 o'clock the last shot was fired, and the visitors were starting for home.

Hood Waters was suffering at French Lick from an attack of rheumatism in his right hand, and had not fully recovered; in consequence he flinched once in a while, and scored misses instead of hits.

The squad of experts—Trimble, Waters, Phil and See—broke 97 out of 100 in event No. 8; not a bad squad score.

High gun for the day went to Phil, with 169 out of 175; Waters, second, with 162; Trimble, third, with 158. High amateur was Conrad, with 147. Waters won high average for the two days, with 315; Conrad, second, 302; Parker, third, 284.

The scores follow, all of the first day's events being given together:

Nov. 5, First Day.

Events:	1 2 3 4 5 6 7 9 10 11	Shot

Mrs Ayres 8 .. 8 11	50	27

Two-day general averages, 350 targets: Waters 315, Conrad 302, Parker 284, Stickles 277, Stienman 264.

BONASA.

National Gun Club.

FRENCH LICK, Ind., Oct. 31.—At a meeting of the Advisory Board of the National Gun Club, held at French Lick, Ind., it was decided to extend the charter membership period of the club for another year, it will close Dec. 31, 1904. All of the present officers of the club are requested to continue in their positions.

At the close of our first tournament, I desire, personally, and as President of the National Gun Club, to extend to Mrs. F. M. Holloway, Secretary and Treasurer, the most hearty and sincere thanks for the wonderful effort she has made in behalf of the Club. Her zeal and industry have been untiring, and any success that may come to us is largely due to the work she has done.

J. M. LILLY, Pres. N. G. C.

New York Athletic Club.

Nov. 3.—The main event of the shoot of the New York Athletic Club, held to-day on the club grounds, Travers Island, was a handicap at 100 targets, for the Vilmar cup. The scores were as follows: F. C. Perkins (20) 85, G. E. Greiff (2) 83, W. J. Elias (40) 97, Kitner (40) 77, F

Annapolis—Analostan Team Contests.

WASHINGTON, D. C., Nov. 7.—The Annapolis, Md., Gun Club and the Analostan Gun Club, of Washington, D. C., have concluded their match shoots for this year. The agreement between the clubs was for three matches, best two out of three, ten men to each team, and 50 targets per man in each contest, the losing team to present the winner with a handsome silver loving cup. The first and third contests were held on the grounds of the Annapolis club, and if there are better grounds in this country the writer has not seen them. They are located across a branch of the Severn River, a short distance from Annapolis, on high, sandy ground, which is part of a shady, well appointed picnic ground. The Sergeant system of traps is used, and each shooter occupies a separate stand, made of brick, six or eight inches high and about four feet square. This is an excellent idea, as it prevents crowding when a "change" is called. The scorer's stand is high and fashioned much like a judge's stand on a race-course, and is provided with a blackboard in sight of all. The trap-puller also has a raised stand, and it is impossible to crowd him. The cashier's stand is enclosed, and near it is the pump, which is also covered, and under the same roof wash basins and towels are provided. Great big, comfortable benches are scattered all about under the trees, and near the shooter's stand is a large dancing pavilion, in which the shooters can take refuge in case of stormy weather.

The Annapolis boys are past masters in the art of entertaining, and our club is under many obligations to them for the many courtesies shown. On our last visit over there the boys treated us to steamed oysters, fresh oysters, fat sandwiches, drinkables ad lib., including "Sparetta," a wonderful tonic for the nerves, a sure cure for the blues, and the best ever for a shad-bellied dyspeptic. It is compounded by one of the shooters, the good-looking and affable Dr. Smith, of the Annapolis club, and what it would do for a man if the directions were followed is impossible to prognosticate.

The targets in all of the matches were thrown very swift, none of them less than 55yds. and most of them appeared to go 65yds. The angles were unknown, and so well did the trappers do their work that it was impossible for the shooter to guess the flight.

Our club won the first match by 7 birds. The second contest resulted in a tie, each club scoring 365 birds. It will be noted that the scores in this match were very low. The poor work may be attributed to the manner in which the birds were thrown—they were very low and extremely swift; and also to the weather, which was exceedingly warm. The sweat simply poured, and it was impossible to shoot in form. The boys who used glasses were badly handicapped.

The clubs flipped a coin to settle where the tie should be shot off, and Annapolis won. Our club journeyed over there, and in the last match were beaten 8 birds. Each club has therefore won one match, and the deciding shoot will not be held until next spring. When the tie had been shot off it was discovered that after shooting at 3,000 targets there was only one target difference between the teams. This is considered as remarkable.

The members of both teams are strictly amateurs, and attend few tournaments; but we think the records made by the members are quite creditable, and especially so in the last match, the twenty men averaging over 80 per cent.

The matches have been so pleasant and agreeable that it is likely that they will be continued next year and be a feature of the shooting in this vicinity.

Following are the scores of the three matches:

First Match.

W. H. HUNTER, Sec'y.	

Poughkeepsie Gun Club.	
POUGHKEEPSIE, N. Y., Oct. 29.—The Traver cup—a beautiful trophy, donated by Mr. A. Traver, the popular captain of this club—was shot for, the first time, to-day, under a new and improved system of handicapping. The race resulted in a tie between Smith and Claymark. The tie, owing to darkness, was not shot off, it being decided to hold the shoot-off over until next week.	
The system of handicapping that is now being used is going to make this cup a "lively race," and it will be a long time before any one man will win it six times, which he must do to establish ownership. That the handicapping is well done a glance at the scores in event No. 6 will prove.	
The committee having charge of arrangements for our New Year's Day shoot will soon be able to give full particulars of what we expect will be the greatest shoot ever held along the Hudson. Wicker shot along.	
Events:	1 2 3 4 5 6 7
Targets:	10 10 10 10 15 25 10
Traver, 1	9 8 11 10 .. 24 6

Smith, 6 8 13 25 9
Claymark, 6 11 25 7
Winans, 7 24 ..
*Marshall 18 ..

Nov. 5.—Notwithstanding that there were two cups to be shot for to-day, the attendance was very slim, but six men at the score.	
The club cup, in event No. 4, was shot for under the old handicap system, and was won by H. W. Marshall. Event No. 5, for the Traver cup, was won by H. E. Winans, under the new handicap system. The shooting to-day was not up to the standard generally set by those present, high wind and bad light being responsible for the low scores.	
Quite a number of the boys will attend the shoot at Ossining on the 18th inst., at which time our team will again try to lift the cup that Ossining won from us, and barring our usual run of hard luck, we expect to give the Ossining men "the race of their life."	
Events:	1 2 3 4
Targets:	10 10 10 25
Claymark, 2	8 8 .. 15
Smith	6 8 7 15
Traver 21
Scott	4 .. 2 ..
Event No. 5, Traver cup:	
Hans	3 16
Smith	5 24
Marshall	7 23
*Re-entry.	
SNANIWEH.	

Boone Gun Club.	
BOONE, Ia., Nov. 4.—Eighteen shooters took part in the Boone Gun Club's one-day tournament. The weather was warm and pleasant, but the scores ran low, owing to badly thrown targets. The club added no money, but gave \$5 for high amateur average, and \$3 for low average. Hoon, of Jewell, won high average, and Crony, of Boone, won low average. The club has fine grounds in the North Side Driving Park, and has just completed a nice little club house. F. C. Whitney had charge of the office. Budd was the only expert present, and shot through the programme for targets only, tying Hoon for high average.

IN NEW JERSEY.

Franklin Gun Club.
Franklin Furnace, N. J., Oct. 31.—At the club shoot to-day, shooting at 30 targets, F. Southerd broke 23, John Williams 22, A. Wright 21, Frank Kishpaugh 20. Henry Pope broke 7 out of 11; Will Pope, 4 out of 12; Goldsmith, 3 out of 15; A. Wright, 1 out of 10.

Pattenburg Gun Club.
Pattenburg, N. J., Oct. 31.—The scores of the regular monthly medal shoot are appended. Our new man, who has never shot before, made a score which speaks for itself. We think he will be a medal carrier in time. Stamets won the gold medal. Holbrook the silver.

Klepects, Jr.	5 13 5 11 13 10 6
Greene	.. 10 8 12 .. 9 7

Crescent Athletic Club.	
Bay Ridge, L. I.—The first contest for the November cup, at the shoot of the Crescent Athletic Club, occurred Nov. 7. Henry C. Werleman and H. S. Vandever tied on 24. In the shoot for the Sykes two-man team cup Messrs. Marshall and Southworth broke 33. Mr. E. H. Lott scored the first win on the Palmer trophy. The scores:	
November cup, 25 targets, handicap: H. C. Werleman 24, H. B. Vandever 24, Dr. Keyes 21, L. C. Hopkins 20, O. C. Grinnell, Jr., 20, J. H. Jack 20, H. L. Meyer 20, W. W. Marshall 19, Capt. Money 18, George W. Meeker 16, A. G. Southworth 15, W. H. Talcott 13, C. H. Chapman 12.	
Trophy, 15 targets, handicap: Hopkins 15, Marshall 14, Raynor 14, Meyer 13, Grinnell 11, Werleman 11, Money 11, Southworth 11, Meeker 10, Vanderver 10, Jack 7.	
Sykes trophy, team match, 25 targets, handicap: Team No. 1—Marshall 18, Southworth 15; total 33. Team No. 2—Meeker 16, Grinnell 16; total 32. Team No. 3—Vanderver 23, E. H. Lott 23; total 46. Team No. 4—Money 19, Hopkins 22; total 41.	
Palmer trophy, 25 targets, handicap: E. H. Lott 22, Southworth 21, Grinnell 18, Vanderver 17, Money 17, Meeker 15, Raynor 15, Meyer 15, Hopkins 14, Jack 14, Chapman 14, Marshall 13, Talcott 6.	

Decatur Tournament.	
DECATUR, Ill., Nov. 3.—The shoot held here to-day under the management of Rupert and Standish was a great success. There was such a goodly number of shooters that the targets gave out and the shoot was stopped with the 150th round. It seems strange that a town of the size of Decatur should be shy on targets.	
Ed. Miller made high score, and it was a good one, 144. Rupert came second with 142. John Boa was Mr. Bronough. J. L. Head and Leslie Standish were the trade representatives. The scores:	
Events:	1 2 3 4 5 6 7 8 9 10
Targets:	10 15 15 20 10 15 15 20 15 15
Barns	5 9 .. 9 .. 13 14

National Gun Club.

THE first tournament of the National Gun Club was held at French Lick Springs, Ind., Oct. 27 to 31. It was the intention of the managers to make this a grand national affair, and to that end a very elaborate programme was printed and distributed, which was so liberal in added money and prizes as to be sufficient to draw a large attendance. For some reason, however, it failed, as twenty shooters were the most that shot on any day through the programme. Thirteen shot on the last day, and eight of these were traveling men.

The location is good. While Indianapolis might be better, still the Springs has hotel accommodations second to none, is situated on the Monon R. R., eighty miles from Louisville, about half way between St. Louis and Cincinnati, 279 miles from Chicago, and 120 miles south from Indianapolis. This, with excursion rates good for three months, should have drawn the shooters, especially as the president of the hotel had donated \$500 for prizes.

The last four tournaments, viz.: West Baden, Paducah, St. Louis and this one, have all been very poorly attended, none of them having over thirty, and one of them fifteen. There were good inducements at all of them. Then what is the trouble? It would seem that it was too late in the season. Shooters engaged in business are getting ready for their annual hunt.

There has been an unusual number of tournaments this year. Indiana has tried to outdo Iowa in the amount of trapshooting, and the shooters have put in all the time they can afford to for this year.

The weather was simply the most perfect kind. The sun shone brightly; scarcely any wind; frosty mornings, warm days; everybody was glad to be out of doors, and a good audience witnessed the sport; but it was disappointed with the scores made. True, Elliott, Phellis, Hughes and Trimble lost but 15 for the day, but some of their shooting was away below the average they are capable of making.

The shooters were handicapped slightly, as the best were at 19 and others at 18yds. Then when it came to the championship race, which was carried through the three days, all standing at 16yds., the shooting improved. Hughes made the first 80 straight and lost one in the last string, closing with 99. Trimble lost one out of his first 80, and then had trouble with one in the last string and closed with 98. His score was tied by Le Compte also. The reader will look at the scores in the last event the first day, and the last two on the second and third days, and there he will find the various scores made for the championship cup.

John M. Lilly, the well-known trapshooting enthusiast of Indianapolis, is at the head of this club, as he conceived the idea of uniting in one large society the lovers of trapshooting throughout this country. There is a fraternal feeling connected with this sport not found in any other, hence it seemed a necessity to form a national club.

Mr. Lilly returned from his trip abroad so as to reach this place in time to prepare for the shoot. He was assisted by the hotel management, and large grounds were furnished, though they were not of the best for target shooting. The surface was quite broken, and targets were thrown from the point of a hill. There seemed to be a current that caused them to dip rather frequently. But the worst thing was the background, which was a solid hillside, covered with trees, the varied hues of their leaves being so deceptive as to cause all to miss sharp quartering targets.

John Lilly was general manager and rustler, and a good one he is. He had the assistance in the office of Mr. Allen, the secretary of the Indianapolis club, and also a good one he is. Then he had two good scorers and referees, one of them being Arthur Gambel, of Cincinnati. The arrangements of tents, blackboards and good supply of loaded shells, were all that could be desired.

The target shooting ran three days, with ten 20-target events, or 600 in all. John Boa got a lead the first day, but he fell off some the second day and the others improved, so that Elliott, Hughes and Phellis came forward.

The best shots were moved up from the 20 to 19yd. line on the second day, which was an error in part of the committee, and they remained there for the third day. Hughes, by his good score of 99 from the 16yd. mark, won the high average with 546 out of 600, while Elliott and Boa were only one behind. Trimble was next with 541; then Le Compte 540, Phellis 531, Heer 517, Voris 513, Clark 511, Rike 509, Marshall 504, Waters 504, Henderson 489.

All the boys have excuses. Some drank too much water; others not enough. One had a gun good for 16, not good enough for 19. One did not have long shells; others never shot so poorly, etc.

Rolla Heikes was missed. He is at home very sick. The boys were in communication with him daily by telephone, and were pleased to learn of improvement in his condition.

Mr. Tom Taggart was aware that the boys would like some pigeon shooting, so on the second day a 15-bird sweep was arranged. Then on the third day, John Hill arrived with his sparrows, and the afternoon was taken up with three sparrow events. Some fine scores were made, Tom Marshall going 40 straight, and others losing but one. The conditions for sparrow shooting were hard—a dark day, bad ground, dead grass and weeds just the color of a sparrow, and the far-away background, so bad as to hide the little "beggars."

The complete scores for the three days' target shooting follow here, and the live-bird and sparrow matches:

Oct. 27, First Day.

Nash, 16.....	17	17	17	17	16	13	15	140	112
Clark, 17.....	18	16	17	18	19	15	19	18	15	18	200	173

Averages for three days, 600 targets: Hughes 546, Elliott 545, Boa 545, Trimble 541, Le Compte 540, Phellis 531, Heer 517, Voris 513, Clark 511, Rike 509, Marshall 504, Waters 504, Henderson 489.

Fifteen live birds, \$10 entrance, three moneys: Clark 14, Voris 15, Heer 15, Snops 13, Waters 12, Lilly 11, Boa 15, Le Compte 13, Rike 14, Ahlers 12, Henderson 14.

Twenty sparrows, \$6 entrance, four moneys: Clark 16, Voris 18, Stillwell 16, Henderson 14, Rike 17, Boa 19, Snyder 19, Heer 20, Le Compte 17, Nash 18, Marshall 20, Phellis 20, Hughes 20, Elliott 19.

Event No. 2, 20 sparrows, \$6 entrance: Clark withdrew, Voris 18, Stillwell 18, Henderson 20, Rike 16, Boa 17, Marshall 20, Hughes 18, Heer 19, Phil 19, Snyder 20, Elliott 18.

Event No. 3, 20 sparrows, \$6 entrance: Elliott withdrew, Marshall 20, Phellis 20, Voris 20, Boa 16, Stillwell 17, Heer 19.

Oct. 30, Fourth Day.

Championship race, 100 sparrows, shot in five 20-bird races, with \$6 entrance, and money divided Rose system. The high score to win a \$50 cup.

The sun shone brightly, and the sparrows were lively, erratic and just as deceptive as they possibly could be. In the first event Heer went straight. Voris got 19, Phellis and Waters got 18. Voris made two more 19s, Phellis one, and Washburn one during the shoot.

Heer and Voris went into the last event a tie, and both killed 17, and finished with 90, making a tie that they shot off on 50 birds. This brought the onlookers all to a fever heat. During the first string of 25 each killed 24, but starting on the last string Heer drew three exasperating screamers in the first five, and lost them in a row, and then some more, so that he only finished with 43, while Voris made 45 and won.

Voris was warmly congratulated, as he is one of the oldest and best known shooters, not only of Indiana, but of the Central States.

Heer has a "hard luck" story, as he had a balk during the day. When the trap was sprung two birds went up, and he did not shoot. One of the birds went out of bounds; the other did not. The decision by the referee was "Lost," and he would not allow another shot. There are no printed rules governing sparrow shooting, and as the shooter has the live-bird rules in view, and if he shoots, the referee could not know which one he shot at, so that the proper way would have been to allow another shot, as in the event that Heer had killed he would have won the cup without a tie. The scores:

Events:	1	2	3	4	5	Shot	Broke.
Sparrows:	20	20	20	20	20	at.	Broke.
Ed Voris.....	19	19	16	19	17	100	90

J M Lilly.....	20	17

Shoot-off for cup, as Voris and Heer tied on 90: Voris 45, Heer 43.

New London Gun Club.

NEW LONDON, Ia., Oct. 29.—The New London Gun Club's eighth annual tournament closed to-day. The attendance was good, and the weather warm and pleasant.

The programme was a long one. The regular events had 200 targets, and a special 50-target handicap, open to all; entrance \$5 each day. All the regular events were divided 40, 20, 20 and 10, and handicaps 30, 25, 20, 15 and 10 per cent.

Paid experts were not allowed to contest for purses in regular events.

A handsome gold watch was given the winners of the handicap events. Fourteen averages, ranging from \$5 to \$25, were given the amateurs. The professionals had \$25, \$20, \$15, \$10 and \$5 given them for averages, beside \$12, \$8, and \$5 for long runs. Two gold watches were given to the 90 and 80 per cent. amateurs. A gold badge was given the amateur making longest run. The two low men shooting through programme had their hotel bill and railroad fare paid. The amateur making longest straight run received \$5, and \$5 for making the largest number of straight scores during the tournament.

The handicap of Tuesday was won by Fred Ellett, of Keithsburg. The second day's handicap was won by John Burmister, of Spirit Lake.

M. and R. Thompson won the handicap on Thursday, after

shooting out Klein. They decided to hold the watch and to decide the tie at some future time.

High amateur average was won by Klein.

Burnside won the 90 per cent. trophy in shoot-off.

E. G. Wallace, of Marshalltown, won the 80 per cent. watch after shooting out a number of good men in the tie.

Fred Gilbert won the long run in expert class, breaking 100 straight. He also won high average.

On Wednesday evening Dr. and Mrs. Cook had the shooters out to their home. This is one of the best events in the programme. Two special prizes were won by Wettleaf, of Nichols, and Chas. Spencer, of St. Louis. After an exciting contest, Wettleaf won first from Gilbert. Spencer took second without a tie.

Mr. S. A. Tucker was attending the tournament, but did not shoot.

Dr. Cook, secretary of the New London Gun Club, informs me their programme for 1934 will be a good one. They will add more money and give some fine special prizes. The tournament will be held some time

Cincinnati Clubs.

CINCINNATI has probably more clubs and associations of sportsmen than any other city in the country. There are between sixty and seventy fishing clubs and a number of gun and rifle clubs of more or less importance, some having a permanent organization, owning or leasing grounds where convenient club houses are erected, and holding regular shoots, and others being composed of a few lovers of sport, who meet with more or less regularity, but have no fixed club house. The membership lists of these clubs, from the earliest days to the present time, contain the names of men prominent in the business and professional life of the city, and many of them well known and successful in the political arena.

All were deeply imbued with a love for field sports, and it was this common feeling which led to the formation of clubs, where all could meet on equal footing and enjoy, at stated times, a few hours of friendly intercourse.

The first club of which any record has been preserved—and without doubt the first in the city—was the Cincinnati Shooting Club No. 1, organized in 1831.

A number of sportsmen met on the evening of June 28, 1831, John J. Wright being elected chairman, and Geo. W. Neff secretary, the object of the meeting being to effect the permanent organization of the club. The following officers were elected: Robert Buchanan, President; R. Somerby, Vice-President; Kirkbride Yardley, Treasurer; Caleb Jones, Secretary. Standing Committee, John J. Wright, Wm. Corbin and John Winters.

The by-laws provided that the name of the club should be as given above. Quarterly meetings to be held on the fourth Monday in June, September, December and March. Officers to be elected at the June meeting.

The membership was limited to twenty-five at the same time, and only by unanimous consent could this number be exceeded. The annual dues were fixed at \$5. It was provided that distinguished sportsmen could be elected as honorary members. Once a year a day was to be appointed by the officers for a trial of the skill of the members, and premiums (to be paid out of the club's funds) awarded to the winners. At these trials no member was allowed to shoot by proxy, and the premiums could not be won by the same member twice in succession. The distance was 20 yards.

There being at this time no restriction on the killing of game, either as to season or quantity, the club provided an open season by a by-law, which was of course binding only on members of the club. Open season: Woodcock, the open season shall commence on July 1, and end Feb. 1. Quail, pheasants and rabbits, open season to commence on Sept. 1 and end March 1. Any member shooting out of season to be fined 50 cents for each offense.

It was evidently not considered necessary to furnish any protection to the various other varieties of game birds which were found in this section at that time.

The early members of the club were K. Yardley, Geo. W. Neff, Wm. Neff, Wm. Corbin, D. Trotter, R. Somerby, John J. Wright, W. P. Noble, Geo. Graham, Jr., Benj. B. Fessenden, Thos. Sharpless, R. Buchanan, Thos. Dawson, C. Jones, Jos. J. James, J. D. Garrard, N. F. Pendleton, Jacob Anmack, Thos. Winter, E. T. Yardley, Geo. Smith, Wm. Tift and John Winters. At various meetings during the existence of the club, the following were elected to membership, to fill vacancies caused by death, resignation or removal from the city: J. C. Armstrong, Thos. D. Carneal, Jas. Gibson, M. L. Harbeson, Jacob Strader, T. Mattock, H. Jordan, Silas Bryant, H. Hamilton, Wm. J. Van Horne, E. J. Miller, Dr. Jedediah Cobb, Joseph Longworth, Geo. Williams, Ira Athearn, J. Wheelwright, G. H. Shoenberger, W. H. H. Taylor, Francis Read.

A special meeting of the club was held at Massard's Coffee House in the fall, and the following resolutions adopted and added to the constitution as Articles XX. and XXI.

Resolved, That the first Thursday in November shall be fixed upon to hold the anniversary dinner of the club, which shall be a game dinner, from game killed by the members the day preceding, divided into two parties or sides, by the president and vice-president. Each member may invite a guest by paying his expenses.

Messrs. Wm. Corbin, J. J. Wright and J. D. Garrard were appointed a committee to report a suitable scale of game. It was also resolved that the members should appear at each June meeting, dressed in sportsmen's costume and with their shooting apparatus for inspection. At this meeting John Winter resigned from membership, and J. D. Garrard was elected to fill the vacancy on the standing committee.

The first hunt of the club to provide game for the dinner was held on Wednesday, Nov. 2, and the members met on the evening of that day to exhibit the game shot and count the points. President Buchanan's side counted 161 points, two of his men,

Smith and Jones, not taking part. Vice-President Yardley's side had a total of 72 points. The first dinner was held on Nov. 3, at Wm. Corbin's Sportsman's Hall, located on the Turnpike, three miles east of the city. Twenty members and a like number of invited guests sat at table, and many toasts were drank among them. The following seem worthy of being recorded:

"The Object of our Association; Improvement in the Noble and Manly Exercise of Field Sports."

"The Honest Sportsman; May his 'Charge' of Care be Light and the 'Recoil' of disappointment never felt."

"Our Country; May We 'Mark' Well Her Honor and always 'Stand Ready' to Defend It."

"Fire Arms—Every American should know their Use; But for them Our Days of Freedom would be Numbered."

"Our Brother Sportsmen throughout the World—While their 'aim' is correct, may they Never 'misfire.'"

"The Feathered Tribe—"On the Wing' or on the Table, the Sportsman's favorite."

"The Fair"—The 'Surest Shots' where the Heart is the 'Game.'

K. and E. T. Yardley having removed to Philadelphia, Francis Read was elected treasurer in place of the former at a meeting held in December at the Louisiana Coffee House, and Matthew L. Harbeson was elected a member in place of the latter.

At this meeting the club subscribed for the Cabinet of Natural History and American Rural Sports, established in 1830, published in Philadelphia, and for Skinner's Sporting Magazine, published in Baltimore, where it was established in 1829, and was the first publication on field sports issued in the United States.

Mr. Corbin reported the amount of game killed by him since the formation of the club to Dec. 20, as follows: Woodcock 75, quail 163, rabbits 21, rail 3, ducks and mallards 9, ducks and teal 55, bullhead plover 8, yellow-leg plover 13.

The record of game killed by individual sportsmen, and in the side hunts are, I think, interesting to present-day sportsmen, as showing the variety and abundance of game in the early days in this section.

At the quarterly meeting, on March 26, 1832, Messrs. Corbin, Anmack and Gibson were appointed a committee to report a scale of game. The members were divided into sides for a shoot on April 3, to provide game for the supper to be given on April 4. The supper was given, and was a success, the records saying, "That after a time spent in eating, telling hunting stories and singing, the company adjourned at an early hour (for sportsmen)."

The game brought in by the two sides for this occasion was as follows:

Buchanan's side—R. Buchanan: 2 Spanish curlew, 1 blue-wing teal, 3 marling; points 36. J. Anmack: 1 green-wing teal, 1 banty, 12 snipe; points 30. J. Gibson: 1 mallard, 2 wood duck, 2 green-wing teal, 3 snipes; points 25. B. B. Fessenden: 1 mallard, 2 wood duck, 1 green-wing teal, 4 snipe; points 24. Total points, 115.

Corbin's side—W. Corbin: 2 wood duck, 7 teal and banty, 1 yellow-leg plover, 1 marling, 16 snipe; points 64. J. J. Wright: 7 teal and banty, 6 snipe; points 33. F. Read: 1 spoonbill duck, 1 blue-wing teal; points 8. W. Noble: 5 ducks, 1 batter box, 3 teal, 9 snipe; points 55. T. Dawson: 3 teal, 14 snipe; points 37. J. D. Garrard: 1 mallard, 6 snipe; points 17. G. Smith: 4 marling; points 4. Total 218.

The annual meeting was held on June 25, 1832, and the officers for the ensuing year were elected. The annual dues were also fixed at \$2; the initiation fee to remain at \$5. Members unable to give a satisfactory reason for not turning out on the appointed shooting days of the club, the meeting decided should be fined \$1.

The officers elected were: R. Buchanan, President; R. Somerby, Vice-President; F. Read, Treasurer; W. P. Noble, Secretary; Standing Committee: Wm. Corbin, J. J. Wright, J. D. Garrard.

The game scale as reported by the committee was as follows: Quail or partridge, each 1; woodcock, 5; bullhead or golden head plover, 2; pheasant and grouse, each 15; deer, 50; rabbits, 2; canvasback, black ducks and mallards, each 5; English snipe, 2; yellow-leg plover, 2; Spanish curlew 10; wild turkey, 20; wild goose or brant, each 30; rail, 1; wood duck and baldhead, each 4; teal, bunkers and all other ducks fit for the table, each 3.

The first recorded trapshooting match of the club was held on Jan. 30, 1833, at Corbin's Sportsman's Hall. The day was mild, with a light drizzling rain, "though pleasant enough for shooting," writes the club secretary.

Wild pigeons were used in this match, and in matches for many years afterward by clubs in different parts of the country, and there is no question but what this practice was an important factor in the practical extinction of this beautiful bird, which was so abundant in certain sections, even as recently as the '70s. The ties were shot off at quail—what a united protest would be heard in these days against the sportsman who would countenance such an unsportsmanlike (as we deem it) proceeding by his presence.

A meeting of the club was held at 11 A. M., and the following

regulations were adopted to govern the intended match at pigeons and quail for premiums. The distance for shooting at pigeons was fixed at 20 paces, and at partridges (quail) at 12 paces from the traps, birds to fall within the fence (about 100yds. in area) or no hit. If one copper misses, the other barrel to be used, but not at the same bird. Five pigeons to each member. First prize, \$20; second, \$10; third, \$5. Following are the scores made:

Five pigeons: Graham 2, Harbeson 1, Noble 4, Fessenden 2, James 2, Anmack 5, Corbin 2, Wright 2, Strader 2, Gibson 5, G. W. Neff 5.

The ties were shot off at quail: Neff 4, Gibson 1, Anmack 4. Neff and Anmack shot off the second tie at 5 pigeons: Neff 4, Anmack 3. First prize was awarded to Neff, second to Anmack and third to Gibson. This was the first trapshooting match in the United States of which any record exists, as far as the writer has been able to learn.

The meeting on March 25, appointed April 2 as the day for the spring hunt, the game to be exhibited and counted at Holmes' Coffee House, on the 3d, and a game supper to be given there on the 4th. The hunt day was cloudy, with rain after 2 P. M. The weather for three weeks previous to the hunt had been dry and unfavorable for snipe and ducks, and under these conditions the hunt was considered a very successful one. The game killed was as follows: Mallards, 3; spoonbills, 1; teal, 18; snipe, 110; wood duck, 6; marling, 18; ducks, 2; banty, 1; sprigtails, 1.

A meeting was held at the Commercial Exchange on Sept. 23, when officers were elected, though it is not stated why the election was not held in June, as provided in the constitution, but lack of attendance at the meetings was probably the reason. The officers elected were: R. Buchanan, President; J. D. Garrard, Vice-President; F. Read, Treasurer; W. P. Noble, Secretary. Standing committee: Wm. Corbin, J. Anmack and J. J. Wright. New members elected were Henry Jordan and Chas. Bryant. Mr. Harbeson resigned as an active member, and was placed on the honorary member list. The following report of game killed by the members was handed to the secretary and recorded: Buchanan: pheasants, 3; ducks, 4; partridges, 5; rabbits, 2. Corbin: partridges, 408; rabbits, 41; snipe, 139; woodcock, 13; red-heads, 4; mallards, 49; widgeon, 4; teal, 38; banties, 21; canvasbacks, 4; black duck, 2; wood duck, 6; sprigtails, 13; butter box, 7; plover, 5; rail, 9; curlew, 1. Anmack: Snipe, 24; teal, 1; banties, 3; woodcock, 3; partridges, 39; plover, 3; rail, 2; yellow-leg, 7. Strader: Pheasants, 4; partridges, 24. Garrard: Partridges, 33.

The fall hunt was held on Nov. 5, and the count took place on the 6th, at Holmes', and in number and variety of birds was successful.

On April 1, 1834, the usual spring shoot was held. At the meeting on May 28, it was stated that Mr. Corbin had purchased a quantity of wild pigeons, and the standing committee appointed May 30 as the day for the shoot. It was decided not to offer any premiums. No record of the shoot was kept.

R. Buchanan tendered his resignation as president at the meeting of Sept. 5, and Vice-President Garrard, with J. J. Wright and J. J. James, were appointed a committee to express to him the desire of the club that he reconsider his action. On Sept. 25, Mr. Buchanan having been placed on the honorary list, his resignation was considered accepted. Geo. Neff also resigned, and Mr. Read vacated the office of treasurer. The meeting was adjourned to Oct. 4. At this meeting B. B. Fessenden was elected President pro tem. Caleb Jones was placed on the honorary list, as was W. P. Noble, at his request. The following officers were elected: J. D. Graham, President; J. Strader, Vice-President; J. Sumach, Treasurer; T. Mattock, Secretary; Standing Committee: Corbin, Wright and Jordan.

At a special meeting on Oct. 12, held at Holmes' Coffee House, H. Hamilton was elected a member. It was decided to hold the annual meeting at Sportsman's Hall, all arrangements to be made by the Standing Committee. At the meeting on Oct. 22, which was held at Holmes', the club was divided into sides for the hunt for the anniversary dinner. Messrs. Jordan and Corbin were captains, as they counted the most game in the spring hunt. At this meeting Mr. Armstrong was placed on the honorary list at his request.

The hunt was held in November, the game being counted at Holmes' on the 5th, the result being as follows (points in parentheses):

Jordan's side—H. Jordan, 1 woodcock (5), 4 snipe (8), 3 rabbits (6), 49 quail (49), total, 68. J. D. Garrard, 2 turkeys (40), 3 woodcock (15), 8 mallards (40), 1 rabbit (2), 17 quail (17), total 114. J. J. James, 8 teal (24), 1 snipe (2), 23 quail (23), 1 rabbit (2); total 51. Winter, 1 mallard (5), 3 teal (9), 4 quail (4), 2 snipe (4), 1 turkey (20); total 42. Bryant, 2 rabbits (4), 1 quail (1); total 5. Strader, 2 teal (6), 18 quail (18); total 24. Fessenden, 5 teal (15), 2 rabbits (14), 8 quail (8); total 27; total points for side, 331.

W. Corbin's side—W. Corbin, 2 woodcock (10), 59 quail (59), 6 rabbits (12), 1 mallard (5), 1 snipe (2), 1 marling (1); total 89. J. Anmack, 8 woodcock (40), 1 teal (3), 13 quail (13), 2 rabbits (4); total 60. Gibson, 1 turkey (20), 3 mallards (15), 2 teal (6), 4 rabbits (18), 1 woodcock (5), 10 quail (10); total 64. Schaick, 1 turkey (20), 1 rabbit (2), 2 snipe (4), 12 quail (12); total 38. J. J. Wright, 2 quail (2); total 2; total points for side, 253.

At the regular quarterly meeting held on March 23, 1835, at Holmes', Messrs. Wm. J. Van Horn, E. Miller, Dr. J. Cobb and Joseph Longworth were elected to membership. April 1 was selected as the day for the spring hunt, the game to be exhibited and counted at Holmes' on the 2d, and the dinner to be given at Corbin's Sportsman's Hall on the 3d. All game counted to be at the disposal of the club. The honorary members were invited to take part in this hunt, their game to be counted one-half to each side of active members. Wm. Corbin and J. D. Garrard were captains. This was the best hunt held by the club, the game brought in being 17 mallards, 8 sprigtails, 5 widgeons, 9 wood ducks, 163 snipe, 16 teal, 8 marlings, 5 baldheads, 4 banties, 1 goosander.

Fifty-five members and guests assembled around the tables at Sportsman's Hall at 4 P. M., and partook of the game, to which had been added some fine bass and salmon.

The annual meeting was called on June 22, and adjourned to June 29, at which date the following officers were elected: J. D. Garrard, President; Jacob Strader, Vice-President; Joseph Longworth, Secretary; Jacob Anmack, Treasurer. At this meeting the by-law (No. 17) regulating the open season on woodcock was repealed, and it was left with the Standing Committee to prescribe from year to year, and communicate to the club the proper season for commencing the woodcock shooting. The annual fall meeting of the club was held on Sept. 23, and arrangements made for the fall hunt. It was decided to have the club turn out on Oct. 19, hunt on the 20th, exhibit and count game on the 21st at Holmes', and dine on the 22d.

On Oct. 17 a meeting was held, and it was decided to postpone the fall hunt indefinitely in consequence of the unfavorable state of the weather, the committee to notify the club to turn out on such day as they deemed proper. At this meeting Wm. Tift was elected to membership, and resolutions passed at a previous meeting expelling T. Winter, were rescinded.

On Oct. 24 a pigeon shoot was held, the members divided and shot with the following results: Garrard 3, James 4, Schaick 3, Hamilton 2, Van Horne 2, Fessenden 2, Anmack 3, Gibson 4, Wright 3, Dawson 2, Gordon 3, Strader 1, Tift 4, Corbin 2.

At this meeting it was decided that the club should turn out on the first Wednesday in November, hunt on Thursday, count game on Friday, and dine at Holmes' on Saturday. Mr. L. Harbeson was elected an active member at this meeting. The hunt on Nov. 7 was attended by Messrs. Corbin, Garrard, Gibson, Dawson, Bryant, Anmack, Jordan, Schaick, Van Horne and Strader. No record seems to have been kept of the result, nor of the dinner arranged to be held at Holmes'. At the April 23, 1836, meeting, J. J. Wright was appointed to fill the office of treasurer in place of J. Anmack (who was to leave the city) until the annual election in June. R. Buchanan was placed on the active member list. The club having lost by death its president, J. D. Garrard, and secretary, W. P. Noble, Messrs. Fessenden, James and Buchanan were appointed a committee to draw up resolutions of regret. A special meeting was held on Sept. 10 for the election of officers, the result being: Jacob Strader, President; John J. Wright, Vice-President; Wm. Tift, Treasurer; R. Buchanan, Secretary. Standing Committee: M. L. Harbeson, W. J. Van Horne, P. Schaick. An adjourned meeting was held on Sept. 17, at which Geo. Williams and Ira Athearn were elected to membership to fill vacancies.

The regular quarterly meeting was held on Sept. 26, and it was resolved that the books of the club be shot for under such arrangements as the standing committee should provide. Messrs. James Corbin and Schaick were appointed a committee to draw up a new scale of game. The report of the committee on finance and by-laws was read, showing \$33.64, several volumes of sporting publications, and four engravings presented by Major Gano, in the hands of the treasurer. The committee recommended rebating all fines and yearly dues against members up to Sept. 26. The following changes in the by-laws were advised. Each member to pay \$2.50 for the regular anniversary dinner, whether present or not. The fine for not turning out at the annual hunt to be increased to \$2.50. Members not paying fines and dues within three months after same are due, shall be considered as having forfeited right of membership. The seventh proposed amendment stated: "Believing that the members of this club have too strict a sense of honor as sportsmen to shoot game out of season, the fines provided for such breaches by the constitution are hereby abolished and repealed." The committee, Thos. Dawson, J. J. James, R. Buchanan and Wm. Tift, also made several minor changes, which were approved, and their report adopted. Mr. Wm. Corbin reported having shot since June, 197 woodcock, 18 wood duck, 19 blue-wing teal, 7 quail, 3 yellow-leg plover, and 1 rail. The club was divided for the fall hunt, Anmack and Corbin, having the highest counts at the last hunt, being captains. Tuesday, Nov. 8, was designated as the day for the hunt, the game to be counted at Holmes' on the 9th, and the anniversary dinner to be held at Sportsman's Hall on the 10th.

The committee on game scale reported as follows: Woodcock, reduced to 4, pheasant to 10, mallard to 4, rabbit raised to 10, rail 1, turkey reduced to 10, goose 15, curlew 5, clapper rail 4, deer struck out. The new scale of points read as follows: Quail or partridge, 1; common rail, 1; bullhead plover, 2; yellow-leg plover, 2; clapper rail, 4; woodcock, 4; pheasant, 4; turkey, 10; rabbit, 4; English snipe, 2; Spanish curlew, 5; canvasback, 5; redhead, 5; black duck, 5; mallard, 4; wood duck, 4; baldhead, 4; teal, banties and others, 3.

The hunt on Nov. 9 was considered successfully, particularly in regard to ducks and snipe. The following game was brought to Holmes' and counted: Quail, 147; Snipe, 6; rabbits, 36; woodcock, 3; plover, 1; pheasants, 1; mallard, 2; teal, 1; partridge, 2.

The dinner on the 10th, at Sportsman's Hall was served in Corbin's best style, but was not numerously attended, owing to the wet, unpleasant weather, which also caused an early adjournment of the party.

On March 15, 1837, a meeting was held, and it was determined to hold the spring hunt on the 21st, the game to be counted at Holmes' on the 22d, and dinner to be served at the same place on the 23d.

The following note was written by the secretary, R. Buchanan: "On the day for turning out, and previously, it was determined by the counsellors to give notice to the members that owing to the unfavorable weather and great scarcity of game, it would be useless to turn out for a hunt with any prospect of success. Accordingly all the members remained at home, except Wm. Anmack, who was not notified. He reported Wednesday evening with 11 snipe, being the only report made."

A meeting was called for Tuesday, April 11, and the spring hunt was set for Wednesday, the game to be taken to Holmes' on Thursday and the dinner to be given at Sportsman's Hall on Friday at 4 P. M.

On April 14, Mr. Corbin reported to the secretary the amount of game killed by him since Sept. 26, 1836, viz.: 243 quail, 9 bullhead plover, 12 teal, 7 baldhead ducks, 4 mallards, 16 rabbits, 1 Spanish curlew, 23 woodcock, 145 snipe, 1 black duck, 12 banties, 1 wood duck, 5 marlings.

The secretary writes that the spring hunt was held as appointed, but owing to his sickness and consequent absence, no account of the game was taken. The hunt was not a successful one, the amount of game being below the average. The dinner was given as appointed. The following game killed between April 14 and Sept. 18, is recorded, and shows a falling off in quantity. Corbin, 276 woodcock, 6 wood duck, 8 quail; J. Strader, 30 woodcock, 6 wood duck, 5 snipe, 45 quail.

The secretary writes: "Never since the formation of the club have woodcock been so abundant as this summer, and never have the members of the club been so successful in shooting them. The numerous excursions and pleasant dinner parties for the last three months bear ample testimony to the sport they have enjoyed from these noble birds. The summer has been cool and pleasant."

On Oct. 9, at a meeting held at Holmes', the club was called upon to pass resolutions of regret on the death of one of its old members, Henry Jordan. The first Tuesday and Wednesday in November were selected as the days for the fall hunt, and Thursday for the anniversary dinner at Sportsman's Hall. Messrs. Corbin and Schaick being highest in count at the last anniversary hunt, were appointed captains, and chose sides.

Messrs. J. Wheelwright and G. H. Shoenberger were elected to membership on Oct. 28. The weather on the hunt days was clear, dry and pleasant, but game was not plenty, at least for most of the members, the whole number of points counted being 309, which was rather less than the average. The dinner was never served in better style, nor more numerously attended, but in spite of the general enjoyment, the company separated at an early hour.

On April 16, 1838, at the meeting held at Holmes', Mr. H. H. Taylor was elected a member. The spring hunt was set for Thursday and Friday, April 19 and 20. The game to be counted at Holmes', and the dinner to be held at Sportsman's Hall, on the 21st at 4 P. M. At this meeting a new plan was tried, which was not a success. It was decided that the club should not be divided into sides as heretofore, but that each member should volunteer his best exertions for the occasion. For many years no further entries were made, but in 1863 Mr. R. Buchanan, the last secretary, closes the record book with the following:

"Note.—The volunteer system as provided in the resolution of the last meeting recorded did not work well. Emulation was destroyed. But few members turned out at the spring hunt, none reported, and the dinner was abandoned."

No regular meetings took place during the summer, but a few of the members turned out for a hunt on Nov. 6 and 7, 1838, brought in their game on the 8th, and dined at Corbin's Sportsman's Hall at 4 P. M. on that day. The game reported was as follows: W. Corbin, 54 woodcock (216), 4 quail (4), wood duck (4); total points 224. Wm. L. Harbeson, 27 woodcock (108), 1 rabbit (4), 1 bullhead plover (2); total 114. J. Wheelwright, 3 quail (3), 1 rabbit (4); total 73. W. J. Van Horne, 3 quail (3), 2 rabbits (8), 1 bullhead plover (2); total 13. Wm. Tift, 2 woodcock (8), 1 quail (1); total 9. Jacob Strader, 8 woodcock, points, 9; total points, 399.

This account of game is extracted from a loose memoranda found in the book. No account was left of the dinner, which was the last held by the club. The spirit of the association was broken, the meetings quickly abandoned, and the club, after an active and pleasant existence of seven years, dissolved informally.

This entry is made after a lapse of twenty-five years, and out of the forty-two members, but sixteen are now living.

(Dec. 9, 1863.)

Their names and ages are written below: Jacob Anmack, 74; Geo. Graham, 66; Wm. Corbin, 69; J. S. Armstrong, 65; E. J. Miller, 57; G. K. Shoenberger, 57; R. Buchanan, 67; C. Schaick, 58; Wm. Tift, 73; W. L. Harbeson, 58; Caleb Jones, 64; Ira Athearn, 64; W. H. H. Taylor, 57; J. Wheelwright, 53; Jos. Longworth, 51; Thos. Winter, 70.

(Signed)

"R. Buchanan, Sec'y."

For a number of years after the dissolution of this club there is no evidence of the existence of any organized body of sportsmen.

Trap Around Reading.

ORWIGSBURG, Pa., Oct. 24.—The live-bird shooting match held here to-day was a grand success, and attracted a large crowd of sportsmen from surrounding towns. The birds used were old ones, and, assisted by high winds, made shooting hard. The shooters were divided into two classes, the entrance fee for the first class being \$5, while \$2.50 paid an entrance in the second class. In the first class Haverty, of St. Clair, won first money, while Moran, of Schuylkill Haven, with 9 to his credit, won first money in the second class. Schuylkill county rules, 21yds. rise, one barrel only, and gun below elbow until bird is on the wing, governed the contest. Summary:

First Class—Long 6, Goetter 7, Haverty 9, Rehrig 6, Green 6, McQuail 4.

Second Class—Heine 3, Ruppert 3, Burd 8, Gore 3, Clausman 2, Murry 7, Moran 9.

Mahanoy City, Pa., Oct. 3.—Jess Webb, of town, and Joseph Schmicker, of Shenandoah, have been matched to shoot at 15 birds on Thanksgiving Day, for \$50 a side.

Lebanon, Pa., Oct. 20.—William Jones, of Lincoln, defeated Wm. Coyle, of Inwood, in a match at live birds, for \$50 a side, here to-day. Each shot at 15 birds, Jones killing 14 and Coyle 10.

Robeson, Pa., Oct. 22.—A live-bird shooting match took place at the Mansion House shooting grounds, this place, to-day.

First event, 5 birds: McClennan 1, Zeller 5, Hoffert 3, Wertz 4, Kenap 1, Osborn 2, Weidler 4, Sherman 4.

Second event, 5 birds: McClennan 0, Osborn 3, Hoffert 5, Konap 2, Wertz 5, Clark 5, Kurtz 3, Spatz 5, Zeller 4, Sherman 3, Link 1.

Third event, miss-and-out: Spatz 3, Hoffert 3, Clark 2, Kurtz 2.

Fourth event, miss-and-out: Weidler 3, McClennan 3, Hoffert 3.

West Chester, Pa., Oct. 29.—The West Chester Gun Club held the last shoot of the series this afternoon, and it was won by Howard. Bennett won five shoots during the season, and carried off the large silver challenge cup. The fight for the second prize, a carving set, was closely contested, and Howard, winning to-day's shoot, made him tie with Ferguson, each having three wins. On the shoot-off at 10 targets each man broke 8 targets, and then it was decided miss-and-out, Ferguson winning.

DUSTEX.

Trap at Jacksonville.

JACKSONVILLE, Ill., Nov. 3.—In a return match here to-day between ten-man teams representing Mason and Morgan counties, the latter won by a single target. Early in the year Mason county won the original race, which was for a stake of \$100 a side, each team shooting at 50 birds.

A sweepstake programme was also shot, being stopped by darkness at 140 rounds. Charlie Spencer and Frank Riehl, shooting for targets only, won first and second average. E. J. Scott was high amateur.

Events:	1	2	3	4	5	6	7	8	9	10	11	Broke.

Team race:

Mason County Team—Burkhardt 43, Aden 30, L. Mulford 41, W. Mulford 40, Schulte 41, Mangold 42, Bockwitz 43, T. Mulford 36, Ramsey 43, A. Mulford 45; total 413.

Morgan County Team—Ed Scott 46, Goebel 44, Groves 44, Masters 44, Killam 39, Scott 36, Craig 44, Jewsberry 39, Engelbrecht 35, McGill 43; total 414.

KILLMORE.

Fremont Gun Club.

FREMONT, Ind., Oct. 27.—The Fremont Gun Club held its first annual tournament on Oct. 27. The day was all that could have been desired, as weather was perfect and the attendance for our first effort was very good indeed. The management was left entirely to the club's officers, with the exception of John S. Cole, Jr., of Detroit, Mich., who represents the Union Metallic Cartridge Co., and who handled the cashier's office with entire satisfaction to all concerned, and managed to find time to look after his companies' interests with good effect at the same time. He was the only trade representative present, and left a good impression. The club feels greatly encouraged at the success of this its first effort, and are planning another and larger affair to be held earlier in the season of 1904.

The best shooting was done by Mr. Geo. Miller, of Hamilton, Ind., and the Old Reliable Smoke Loshabaug, of La Forte, Ind., these gentlemen carrying away first and second high average respectively. The scores follow:

	Shot at.	Broke.		Shot at.	Broke.
Miller	150	136	Streeter	150	104
Smoke	150	135	Lint	120	81
Tarney	150	129	Davis	130	66
Steele	150	128	Reed	80	54
Shepardson	150	127	Albright	70	17
Sowle	150	120	McKeon	20	12
Morrell	150	114	Cobb	50	19
Gleason	140	110	Rantz	20	9
Hooverstock	150	110	Lewis	20	10
Rich	150	106	Scott	10	5

LINT, Sec'y.

SIDE LIGHTS OF TRADE.

At Paducah, Ky., Oct. 20 to 23, the first four high amateur averages were won with "Infallible." At Newark, N. J., Mr. H. H. Stevens broke 163 out of 180 targets, using 25 grains of "Infallible."

At the Individual Rifle Championship Match, Nov. 3, Dr. W. G. Hudson used the Stevens-Pope .33cal.; Mr. Kelly used a Stevens-Pope, and Mr. Fred C. Ross, third, used a regular Stevens, .32-40. A detailed account, this week, is presented in our rifle department.

At the Atlanta, Ga., tournament, Harry Hall made high average, 163 out of 175. At Millbrook, N. Y., Oct. 16, in a 100-target race for a gold medal and the Dutchess county championship, F. B. Stephenson won. On Oct. 12 and 13, at Mahanoy City, Pa., Neaf Apgar won high expert average and Fen Cooper high amateur average. At Raleigh, N. C., on Oct. 31, Walter Hoff, of the Hazard Powder Co., won high average and made a run of 99 straight. On Oct. 22, at Rising Sun, Md., Lin Worthington won high amateur average. Ail used Peters factory loaded shells. Leroy Leach, Wood Lake, Neb., in his two recent great performances, hitting 990 out of 1,000 and 1,000 straight, used Peters .22 short cartridges, loaded with King's semi-smokeless.

PUBLISHERS' DEPARTMENT.

"The Rifle Gallery," by James E. Bell, Major and Inspector-General of Rifle Practice, District of Columbia, is the title of a work replete with information on the practical matters pertaining to the rifle, the rifle gallery, and the rifle range. Although in it is modestly set forth that it is "for the use of the National Guard, school and clubs," it is besides useful to every rifleman who desires to add to his store of knowledge. The plans of a rifle gallery, the manner of conducting it, the equipment, and the implements for conducting practice, rifle mechanism, gallery shells, sights and sighting, sighting drills, positions (standing, kneeling, sitting and prone), are minutely described and illustrated. The care of the rifle, lubricants, etc., are fully treated. The work contains 100 pages. It can be obtained for ten cents on application to Lafin & Rand Powder Co., Bureau of Advertising, P. O. Drawer 1001, Wilmington, Del.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1908 BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, NOVEMBER 21, 1908.

VOL. LXI.—No. 21.
No. 846 BROADWAY, NEW YORK

OUR CHRISTMAS NUMBER.

THE Christmas Number of the FOREST AND STREAM will be the regular issue of December 5. It will be enlarged to fifty-two pages and will be profusely and handsomely illustrated. Among the features will be the following:

THE STATE DINING ROOM OF THE WHITE HOUSE. Two full-page views showing the game heads with which, under direction of President Roosevelt, the room has been decorated.

AUDUBON'S PORTRAITS OF BIRDS. Three full-page reproductions direct by photography from the originals of Audubon's plates of the wild turkey, male and female, and the Labrador duck.

MULE DEER IN THE YELLOWSTONE PARK. Five pictures from photographs from life.

WHEN THE FROST IS ON THE PUMPKIN. A full-page drawing by W. P. Davison.

THE HOME OF THE ALBATROSS. An account with pictures from life photographs of the great albatross colonies on the island of Laysan.

And other contents to be announced in our next issue.

The Christmas FOREST AND STREAM will be of exceptional interest and value. The number will be among the handsomest publications of the season. The price will be 25 cents. Order from your newsdealer in advance.

FLOATING DOWN THE MISSISSIPPI.

We print to-day the first, preliminary, chapter of the story by Raymond S. Spears of the expedition which he has undertaken for the purpose of giving the readers of FOREST AND STREAM many columns of good reading. Mr. Spears has already and abundantly demonstrated his peculiar equipment for such a trip, and the Mississippi series will not fail to be a welcome part in following numbers.

WHAT OF THE WOODCOCK?

TO-DAY we talk or write of the lordly grouse, of Bob White, game bird of America, or of English pheasants, springing from the ground almost under the feet and shaking their long tails at the gunner, who in his astonishment and half alarm, is likely to fire both barrels in the air as the bird sails slowly away. Two generations ago it was not so. Then the men who wrote and talked about shooting spoke of another bird which then was their favorite, the most highly esteemed game bird of the land. In those days as, in the estimation of the gunner, the canvasback was the chief of all the ducks, so to the heart of the upland shooter there was no bird so near as the woodcock. He is little and round and ruddy of coat, and if you see him on the ground he seems to carry his long bill awkwardly and with difficulty, but as he twists away through the branches of the swamp with eccentric but deliberate flight, he still stirs the heart of the sportsmen of the older generation as does no other bird, except the ruffed grouse.

The woodcock is so easily killed and flies so slowly against the guns and the dogs of modern times that he does not have half a chance for his life. Moreover, he is subject to dangers that never threaten gallinaceous birds or ducks, and his nature is so simple and confiding that he is really unfitted to take care of himself.

When you start him in the swamp, or by the little spring hole where he has been seeking for worms, he flies away, not because he is frightened, but because he wishes to be by himself; and when you invade his solitude he simply gets up and moves away because he does not wish to be bothered by disagreeable strangers. He acts, in fact, much as you might act if, when sitting in a car, a drunken man should come in and drop down into the seat beside you. You would probably move to another seat.

A year or two ago attention was called to the interesting paper on the disappearance of the woodcock by Dr. A. K. Fisher, of the Biological Survey. Dr. Fisher is not

only a scientific man of eminence, but a keen sportsman as well, and having given special attention to the woodcock he could tell better than most of us how rapidly this species is disappearing. What with summer shooting in some States at the north, winter shooting all over the south, and the occasional recurrence of cold storms extending far enough south to freeze the woodcock's winter feeding grounds and so to cause him to starve, this charming little bird has been growing more and more scarce until now it is seldom seen.

It would be interesting to learn from FOREST AND STREAM readers what their experience has been with the woodcock during this autumn. Have many of them been seen? Have many been killed? We know that cover which a dozen or twenty years ago was favorite fall woodcock ground, has been worked over this season without starting a single bird; and there is no doubt that the woodcock are few by comparison with years ago. Still, there may be more this season than we imagine, and if any group of men can give us facts about this, these men will be found among the readers of FOREST AND STREAM.

Early November is the time when most shooters of New England and the middle States have been accustomed to look for the woodcock, picking up in their wanderings of the day a few of these birds, to add to the bag of quail and ruffed grouse which reward the hard but pleasant labor of a day's shooting over rough hills or through tangled swamps. Among the white birch sprouts that grow on the steep hillside, and in the little openings among them, where are to be found low cedars, sumacs, bayberry bushes and blackberry vines, the woodcock like to lie at mid-day and rising from there with twisting flight, to plunge down at evening to the wet spring holes where the grass remains green late in the fall, and the rich black soil furnishes a home for the worms on which they feed.

If you are happy enough to live in the country, and to do your shooting near your home, you know all the spots for miles about where at the different seasons you will find the woodcock. You are not obliged to waste time beating over a great lot of unknown country in the hope of running across a bird here or there, and you can tell whether this autumn there have been woodcock about you.

It would be interesting to know as to this, and we should like to have those who can do so, tell us what they know about the woodcock in the autumn of 1903. But since this little bird is now so scarce, if you set out to make investigation as to the numbers, why not leave the gun at home and take only the old dog, who will show you now, as he has shown so many times before, whether or no there are woodcock in the covers.

PISECO.

REAR-ADMIRAL LESTER A. BEARDSLEE died at Augusta, Ga., November 11, aged sixty-seven years. Admiral Beardslee's death removes one of the Old Guard of the FOREST AND STREAM's contributors. The first number of the paper, printed August 14, 1873, contained a sketch of "Wild Fishing Among the Kroos," off the coast of West Africa, bearing the signature Com. L. A. Beardslee, U. S. N.; and for a quarter century following the nom-de-plume of Piseco was a familiar one in these pages. The career of a naval officer gave opportunities of observing interesting phases of life in all quarters of the globe; and wherever Piseco sailed he found material for papers which were among the most entertaining features of this journal.

Born in Little Falls, N. Y., in 1836, Admiral Beardslee was in 1898 placed on the retired list for age, and after spending some time abroad, made a home for himself at Beaufort, S. C.

The Beardslee trout which happens to be mentioned in our columns to-day, is the blue-back trout of Lake Crescent, which takes its name from Admiral Beardslee. While in command of the Pacific Squadron, 1894-1897, Admiral Beardslee explored the fishing of Crescent Lake, Clallam county, Wash., and there discovered a variety of the *Salmo gairdneri*, which was first described by him in the angling columns of FOREST AND STREAM. The fish was named *Beardsleei* by Messrs. Jordan and Evermann "for Admiral L. A. Beardslee, U. S. N., in recognition of his active and intelligent interest in American game fishes."

AND now comes the case of Willard Ames, of Malone, N. Y., who the other day, with the help of a female companion, drowned a buck in Indian Lake by holding its head under water until it was dead. The incident is one of the manifestations of human brutishness which at first blush might seem to call for comment; but it is difficult to perceive what comment could be more forcible than the bare statement of the facts. Right minded persons abhor such a deed; alienists would probably diagnose it as the act of a pervert; and all of us would pray to be delivered from ever falling into the company of the assembled guests of the house party who congratulated the deer drowners on their success. The Adirondack law should follow that in many other States and forbid the killing of deer in the water. The statute now prohibits crusting, which means killing deer when there is a snow crust through which the deer break and thus become an easy prey. There is no essential difference between clubbing to death a deer in the snow and drowning a deer by holding its head under water in a lake; and the law might well take cognizance of the deer drowners.

THE little girl's composition described pins as things which saved people's lives by their not swallowing them. In like manner glass bottles may be described as things which save the forests by not setting them afire. The beer bottle and the whisky bottle have been inveighed against before now as non-essentials in one's camp outfit; and now the new charge is made against the bottle thrown away by campers, that it is of an incendiary nature, and fires the prairies and woods. A case is reported from France of the burning of a haystack which was ignited by the focusing of the sun's rays by an empty beer bottle left behind by a party of picnickers. In Queensland and other grass countries great care is used to avoid the leaving of glass where it might kindle a fire. The San Francisco Bulletin suggests that some of the forest and grain field fires which break out spontaneously are started in a similar way. If there is reasonableness in the theory, we shall have to add to the injunction to put out the camp-fire another to bury the bottles.

WITHOUT any ulterior purpose of converting, or perverting, the FOREST AND STREAM into a journal of literary criticism, we have given free rein to the participants in the Kipling debate, and both sides have had full opportunity to say their say. This is to give notice that after to-day we shall have room in only one more number, that of November 28, for further discussion of the subject. With that issue the debate will be closed, not to be reopened until Patti shall make another farewell tour. The Kipling controversy has been attended with much interest. Those who have taken part in it have represented a wide geographical range, from Kansas to Newfoundland. The substance of the debate has been copied into our English contemporaries and the merits of the question have been taken up by correspondents of those journals. It may reasonably be assumed that many a reader has been prompted to turn to Kipling's Red Gods in the original volume who otherwise would not have made their acquaintance.

IN his report on the Yellowstone National Park, Major John Pitcher, the acting superintendent in charge, strongly recommends that adequate provision may be made for feeding the game in the Park in the winter. He points out that the settlement of the country adjacent to the Park is constantly restricting the food range, and the danger of loss by starvation is increasing in corresponding degree. The antelope and sheep now winter so near to Fort Yellowstone that it would not be difficult, Major Pitcher thinks, to provide for feeding them.

THAT is an unusual and neglected field of exploration and adventure which Mr. Kephart writes of this week; and amateur cave explorers will not fail to appreciate the value of the hints drawn from our contributor's experience for their guidance.

CORRESPONDENTS are requested to observe that the only address to which communications intended for this journal should be sent is No. 346 Broadway, New York. We have no other office.

The Sportsman Tourist.

Floating Down the Mississippi.

I.—For a River Outfit.

THE worst part of going anywhere always seems to me to be the getting ready for the trip. It is a pleasure to know that every preparation well done has its reward before the end many fold, but the worry lest something important be forgotten, something useless be added to the burdens, makes a hardship of what might otherwise be a most enjoyable portion of a journey, little or long. Probably the fact that my hunting has been reached after weary miles under a pack basket has rendered the getting ready a painful process of boiling down and leaving behind.

Experience eases some of the trials. One learns how little and what is needed after a time, and yet, in spite of the protest of his shoulders, the pack-carrier will add a few ounces that might better have been left behind, and fail to take something that would have proved most useful, or pleasing, unless he each time exercises every care and most careful calculation.

The anxiety is redoubled when a region new to the would-be tourist camper is in mind. In spite of most elaborate precautions and thought, there will be mistakes—so many, in fact, that one is sometimes tempted to not get ready, but just go on the day appointed. That is the easiest way to get ready I know of, but—perhaps, alas!—I've never had the nerve to try it even for a week in familiar woods.

I began last spring to get things together for a trip in a rowboat down the Mississippi River, the start to be made at St. Louis. I had been down the Tennessee in a mountain-made boat and so had some of the duffle necessary, and some idea of what a long river journey would require. On the Tennessee I had a wooden box six feet six inches long, twenty inches wide and four inches deep on the bottom of the boat to sleep on in case of necessity. It kept me above the water that was always in the boat when I slept in it. I slept on the box several times, rolled up in a blanket, never once thinking to fill a couple of sacks with leaves for a bed. This time I thought of my place to sleep first of all. Instead of depending on houses along the bank for a resting place, the boat was to be my house and home. A heavy canvas hammock with a cover sewed on it, making a large bag, is the bed decided on. In some fashion I am to rig it, cot-fashion, from the oar locks, aft to the stern seat by rope or stick, or both. Over this, as in my other boat, I aim to arrange hoops of green cane over which to draw an old nine-foot-long canvas for a boat tent. The open ends of the boat covering will be stopped by the one-time sides of an old lean-to which I carried on a walking trip toward the south; and mosquito netting will be over the openings to keep out insects and snakes, especially snakes.

It seems as if all the old hunting and fishing trips had each left something behind which would serve some purpose or other somewhere along the big river. For instance, some fish-hooks which I used in Huntington Bay, Long Island, are a proper size—No. 1—for the blue cat of the river. I have yet to catch a blue cat, but Mr. Horace Kephart told me this morning here at St. Louis that I'd find them in certain sloughs down the river. I have yet to see a slough to know it for certain, but I'm in hopes of recognizing either the dry-land kind or the behind-the-island sort at the first look at one, also the blue cats.

A very important part of the outfit gathered from my duffle at Northwood, N. Y., was for cooking. It consists of a small frying pan, a graniteware plate, two graniteware pails—one covered—a cup, a knife, fork and spoon—only I've got to get the fork, and mustn't forget. The plate will serve to cover the frying-pan in cooking. The Kid guys me somewhat because I am taking nickel-plated knife and spoons. He says it's a sign of tenderness. At any rate, coffee or soup or potato eaten from old iron leaves a rank taste in my mouth, and I'll not stand it if I can help it. After all, it is the little discomforts that hurt the pleasure of a trip. The big ones are enjoyed, even while they last, by anyone with the love of adventure or with a sense of the fitness of things.

I have always carried a mending kit with me, and the needles, thread, and patches invariably prove of service at frequent intervals. Once an ax wound was sewed up with some of the white thread, and scores of tears, wears, and rips have been closed up by more or less skillful use of needle and thread from the little red case, with its one pocket and half dozen flannel leaves, well wrapped by a cover and tied with a ribbon.

Because of the horror with which I regard all snakes, harmless or otherwise, I have a pair of substantial leather leggings. One blade of my pocket knife will always be keenly sharp for cutting open a snake bite, and in my duffle, handy, will be a vaseline bottle full of matches tightly corked. If other matches get wet, these will not,

and the bottle, if I hold a lighted match inside of it, and then put the mouth of the bottle over the wound, the cooling of the air within will cause a suction that draws the wound—useful in case of a wound by a rusty nail, or insect sting, as well as by a snake bite.

I have an acetylene gas lamp, of the sort used on automobiles. Its light is very brilliant, and when I am tied to a stump down in some bayou I can read one or other of the few books I have with me, or write for a little while before turning in. But this lamp is a matter of experiment. It seems to be a most excellent lamp for night travel if that should ever be necessary—which I hope it won't.

I have woolen and cotton underwear, thickest woolen socks, for in a boat cold feet are apt to come in bad weather; short and long trousers, a pair of blue overalls, a thick sweater, a couple blue half-wool overshirts, two pair of shoes and a pair of moccasins. A mackintosh is a novelty to me when in the wilds, but I have no doubt but what the one I carry will prove its value often enough during the winter.

A 10-gauge shotgun and a heavy revolver are the firearms I decided to bring at the last moment. I carried a .38 caliber rifle part way with me, but when I came to think of the trip, which is not a hunting or fishing one, I decided that the shotgun and revolver were all that are necessary. It will serve for anything I care to kill—even for a bear. For ducks and the like, I could have nothing better. A rifle is well enough for birds when there is a bit of meat in camp, but even a poor hunter can get small game with a shotgun—squirrels included. A copy of the game laws is essential in this connection, for the tourist must never forget that there are laws relating to non-residents in many of the States. But even here the non-resident is not entirely shut off from eating fresh wild meat. Some birds are not protected—blackbirds, for instance, and I have found them good eating on many occasions. A brother of mine, cramped for provisions, once ate a young blue heron and pronounced it good eating. Herons, in most States, are not considered game or songsters. The tourist, it seems to me, should not be without expedients, or hidebound. It is well in getting ready to have in mind some things with which to meet such common emergencies as lack of grub, snake bites, mosquitoes, and the like.

To cook with, I early decided to get an oil stove. An open fire in a sand box under a tent on a boat on a warm, sultry, rainy day, is an abomination, and yet a long-legged kettle, a Dutch oven to cook corn bread biscuit, roast a rabbit or duck, or do other "heavy" cooking over an open fire, seems necessary. It will not do for the tourist who expects to live for months on his own cooking not to have a plentiful supply of utensils for cooking the variety of articles to be had by purchase, acquirement or capture. With two or three varieties of vegetables, a slab of meat, some water and salt, one can make soups, and substantial meals. Beans, Irish and sweet potatoes, onions, condensed milk, a slab of bacon (it's better than salt pork), flour, chocolate, loaf sugar, rice, salt, summer savory, pepper, butter, tea, a can of tomatoes, and perhaps some other things are to be purchased. These, if loose, will be carried in old cloth sugar and salt sacks, of which I have about forty. They serve admirably to pack clothes in, also.

An ax for firewood when I want a camp-fire is needful. Sometimes one is tempted to carry a hatchet. I have carried a short handled hatchet that weighed a pound and a half, and found it very serviceable, indeed; but one is limited to trees not exceeding three inches in diameter if a hatchet is all he carries; also he is liable to scalp his knee with one. I left the hatchet at home, and will get a three and a half pound ax—big enough for work in a lumber camp. In a boat one can enlarge a great deal on the pack-carrier's outfit.

It is always interesting to know about the region one is traveling through—real travel is for the purpose of seeing things. Thoreau traveled all his life through the fields near Concord, Mass., and continually made discoveries in his neighbor's fields and pastures. The same may be said of Thibet is not more to be praised than the discovery of something new in his own back yard. In some respects the stay-at-home explorer is more to be commended. Some hundreds of men have seen and written about the Mississippi. The library explorer need never take a back seat when it comes to so old a stream as the Father of the Waters. In fact, nothing but the figures which have resulted from fifty years of unremitting observation and calculation by men who have done nothing but consider the size and forces—especially the forces—of the Mississippi can in any measure give one a comprehensive idea of just what the Mississippi River means. A mere series of glances at the river is not enough. And yet these figures, to be comprehended, must be read by one who can understand the distances of the stars, and who is filled with wonder at the thought of radium. All that has been said and written about the most wonderful of American streams falls short of the reality. A feeling of disappointment was the first sensation I had when I saw the river for the first time last week. I had just crossed it on the cars, thinking it was backwater from a flood. It looked narrower than I expected; it didn't seem to be rushing onward; it looked sluggish, insignificant, muddy, black. After a time I saw that the little building on the far side was in reality three stories high, the bobbing mass of black drift a ways from the bank, compared to a flour barrel—that seemed the size of a tomato can—proved to be a tree trunk sixty odd feet long pounding away southward. The men of science with their foot rules, their six-ounce glass graduates, their broom handles loaded with lead, and stop watches, their sheets of paper and lead pencils, their gauges, sounding poles, and levels—they have told stories as full of wonders as any that man ever conceived—and one finds them in little pamphlets labeled "Tabulated Results," "Levee Systems," "Reports of the Mississippi River Commission," and other things of that sort.

Poets rise up and put spurs to Pegasus telling of Horatio at the Bridge—but the man who flung the bridge over the river has his story told in mere figures that mean, nevertheless, somewhat more than a clash of arms. It was the scientist who first brought men near enough together to fight, and furnished the means for continuing the combats. No mere passer by, such as I am, could in

any fair measure understand the Mississippi until he examined with care "Tabulated Results" and other things of that sort. One or two of these in an outfit give a traveler something upon which to build his notions of region, its size, and resources. And after these there come the history of the men in the new valley, searches for gold, and the making of a home—land, pestilence and peace, exploration, commerce and growth. Mankind has much to answer for in the development of the Mississippi Valley, and some rewards to gain. A not nice saying up in the Adirondacks is, "There's a man who's got guts." A woodsman who "has guts" is a good fighter and somewhat more. In looking at the history of the Mississippi Valley one is bound to come to the conclusion that its history was made by men who had guts. A history or two is a most useful part of an outfit. I have one in mine, and will make use of it in fine places fit to see for the sake of the men who made it memorable. A series of maps, got out by the Mississippi River Commission showing every landing, house, wood lot, and what not along the river, is a part of an outfit which will be most useful without a doubt in connection with history, but especially so when looking for a place to get grub.

In buying an outfit, or the things that it is necessary to buy, I have always tried to get things of common household use and service, rather than the special things invented for the hunter and fisherman. There is no doubt but what a special camp kit, packed in a very small space, is most useful in the confined space of a very small boat, or canoe, but by adding slightly to the space, those who must consider the fact that the common house ware can be put into it, the heavier material even lending itself to considerable economy of space if care is taken to get that fit in each other, basins the same and matching plates. It always seemed to me that the best camp kit that man who can take common everyday things to camp, and so distribute them in the making of his meals and grub as to get the whole goodness out of each article, from the tent and its poles to the pepper and summer savory. I had this impression one time by Mr. A. H. Clark, of New York, probably can do more camping to the twenty-four hours than any one who has been along the Hudson River. He said: "A man who goes on a vacation does so recreating, not to tear and wear himself to pieces. It was a novel view of the situation to me, but I, by practice that a few little extras in camp, extra salt, extra sugar, an extra vegetable or two, a bottle of catsup, go far toward reducing the hardship against which the body rebels—as every one knows who has passed through the "roughing it" stage of love nature. As a camping trip down the Mississippi for months long is in prospect before me, I have had to consider my outfit with all care.

Mark Twain and other humorists make a laugh matter of such things as fever and ague, dandy fever, "Louisiana shakers" and the muddy water of the river. "They expect us to drink this slush!" an indignant stranger is made to say. To watch the mass of water that fills a common drinking glass from a St. Louis faucet, for instance, as it disintegrates, gathers visible specks that slowly settles to the bottom of the glass, a dull, opaque, thickening, is to suggest all manner of internal troubles. I could taste the clay when I first drank it, but scientists say it is not so dangerous as most well water, and some of the oldest citizens of the United States have drunk this water all their lives, holding the glass toward the light to observe the color of the river therefrom, and rejoice in the convoluted and rounded clouds that appear as the liquid eddies whirls fresh from the thrust of the faucet. It may well to remark that St. Louis has the largest brewery in the world, and that "everybody drinks beer" there. Dealers in distilled water do a thriving business, and alum comes in large packages. The size of the alum is so great that germs are isolated, and, therefore, Science proves this, nevertheless malaria is so prevalent along the river, that like the Jersey mosquito joke. I have laid in a supply of bromo quinine and a pint of whiskey, listerine and vaseline, to meet the common exigencies of bad water and bad air. I said that "by taking care of oneself there is no danger," but clothes nicely adapted to the temperature and humidity, punctuality as regards bathing, consistently appropriate food served in the best style—as a recent magazine article said in regard to typhoid fever there are precautions which one can take, but it is possible to take them all. Fortunately, one need be far from good doctors these days along the river.

As regards the boat, I had in mind to get a flat bottom, flare-sided craft about 18 feet long, 4 feet wide, and 18 inches deep, as near the dory model as possible. But Medart, here at St. Louis, said this would not do so well as a boat often used on the river for a long or by sportsmen. The one I have is just short of 20 feet long, 15 inches deep and about 42 inches wide. It is called a clinker model, and is built of three-eighths cypress boards and oak ribs, keel and other frame. As it is a lap-streak boat, a hole punched in it will be a most serious accident, requiring considerable genuity to repair. But as it is not easy to upset, large enough to stir around in a bit, and looks like its coat of lead-blue color, it promises to be good enough for my purpose—and one needs a good boat when on a journey of which the days in the slough and bayou country will probably be the most numerous. The quality that commends it most is ease of running.

Of course, getting ready for a trip never does end the last day ashore or afloat when "on a vacation" one sees one doing some kind of preparation or another. I carried the things I was to wear from New York State, but waited till I got to St. Louis to buy my utensils and groceries as I would need to buy. The trip began the day I left Northwood, I was still getting ready when I saw St. Louis. From my view of St. Louis seemed decidedly worth looking at—but until I had been there a day or two. On the way to the town I dreaded the stay in the city. I wanted to be "going."

RAYMOND S. SPEAR

Cave Exploration.

THROUGHOUT my hunting ranges in the Ozarks, caves are so numerous that I often vary the routine of camp life by exploring underground. The surface rock of this region is mostly a porous and easily soluble limestone, through which the rain water, acidulated by fallen leaves and other forest debris, sweeps downward and eats out subterranean channels. These channels are enlarged by erosion, and thus caverns are formed. A similar formation is common in western Virginia, Kentucky and the southern parts of Indiana and Illinois. This belt, continued beyond the Mississippi to the Indian Territory, contains the largest and most beautiful caves known in our country. Few of the larger ones have been fully explored, and there are, no doubt, hundreds that no man has ever entered.

It is rare sport to be a pathfinder in the weird realms of the underworld. Sluggish indeed is the pulse that does not leap at the thought of going where mortal has never been, and seeing what no other eye has seen. The spice of adventure, the thrill of exploration, the slightly heroic feeling that comes from risks coolly taken and difficulties overcome, the lure to go farther, farther, and the uncertainty of ever getting back again—these lend to the sport of cave hunting a peculiar fascination. Moreover, it takes no long and expensive journey to reach your land of mystery, and you can go at any season of the year.

In exploring a cave that has not previously been entered, the party should be small. Three men are enough, and four should be the limit. A larger party confuses everyone by its reverberating babble, it moves too slowly, and there is the greater chance that someone will stray or flunk. Let it be understood that this first trip is for the purpose of exploring and nothing else. Choose a leader, and obey him like a soldier. The cave will probably be a labyrinth, both vertically and laterally; so you cannot afford to straggle away from each other. If one of the party gets into trouble, you should be on hand to help him.

Wear old clothes, of course; for you will probably be wet and muddy from head to foot ere you emerge. The clay of caverns usually leaves an indelible stain on cloth. Overalls and an old canvas hunting coat are good—the latter on account of its roomy pockets in which you can stow the necessities of your trip, and so have no stick-outs or hang-downs among your appurtenances. Remember that you must climb and crawl. It is bothersome, if not dangerous, to carry anything that will flop around and get under you when you are wriggling along a shelving rock with an abyss below, or to be jammed and wedged fast when trying to crawl through a narrow tunnel.

It is imperative that every man in the party should carry a lantern. One of the lights may well be a common kerosene lantern. Its bearer should have a good length of strong twine with which to lower the light down pits or precipices. The other men will do better with acetylene lanterns. A common bicycle light does very well, if you remove the clamp and rig a wire bail through holes drilled in the top; but it should be of such kind as will stand on its bottom. Carry spare carbide; also a canteen of water, for some caves are dry, or you may be unable to reach the drainage level. Urine will do for the acetylene lantern in an emergency. Each man should also carry a few short paraffin candles. If not otherwise needed, they are useful to mark difficult or doubtful places on the return route. It stands to reason that plenty of matches should be carried. It is not enough to carry them in a waterproof box—the matches themselves should be waterproofed. This may be accomplished by dipping them in melted paraffin; but these are not thoroughly reliable, for the wax may rub off. A better way is to dip the matches, one at a time, into a thin varnish prepared by dissolving shellac in alcohol, and then laying the sticks separately on paper to dry. If the varnish is too thick, the matches will not burn well. Experiment until you get the right consistency. Such matches will ignite and even after they have been soaked in water a day or more.

Stow where you can get at it a piece of sandpaper well wrapped in sheet rubber. I was taught this kink by an experience that I shall not soon forget. With but one companion, I was exploring a new-found cave that was exceedingly tortuous and had passages leading in every direction. I stopped to examine something while my comrade, not noticing my halt, went on down and vanished. After a few minutes I started to follow my leader. Soon I had to get down on my belly and worm my way through a hole in the rock that was not much bigger than the width of my shoulders, and was crooked to boot. I was lighted by a common kerosene lantern. When I was about half-way through the hole my lantern upset and went out. Its mechanism for opening and closing was new to me, and, in fumbling with it, I dropped my waterproof match box. Fortunately, I laid hand on this precious article immediately, but it was wet on the outside. Then I discovered that there was nothing about me that was dry enough to strike a match on. My clothing was soaked with drip-water, and the rocks about me were wet. I yelled like a good fellow for my partner, but he was far out of hearing. It would have been foolhardy to move, for there was an abyss behind, and I knew not what in front. Since the cave was a labyrinth, there was some probability that Sid might not find his way back by the route he had taken. No one on earth but ourselves knew where we were. Despite the cold air of the cavern, I believe that I began to sweat. The darkness seemed tangible and ponderable. Incalculable tons of rock seemed to close in upon me like a shrinking garment. I forgot that I could get a light with my teeth by jerking a match-head between them. I kept on yelling, and in a few minutes, which seemed æons, I heard the welcome halloo of my comrade in a passage underneath. Slowly he retraced his steps, and released me from an unpleasant predicament.

In the pockets of your coat, or in a pouch strapped so that it cannot dangle nor get under you when crawling, carry a ration in the most compact form (the army emergency ration in tin is all right), a pocket

alcohol stove of the smallest size, a 4-ounce flask of alcohol and one of brandy, and, if you smoke, your pipe and a tin box of tobacco. A compass you will take, of course; but it will prove of slight service if the cave is labyrinthine.

The rear man of the party should carry a ball or tube of light twine for a guide line. This he will let out as he goes along. It is an infallible guide back to the entrance. Each of the other men should carry a spare ball of twine. The man next to the leader should have a 50-foot length of half-inch rope, wrapped about him like a sash. Carry nothing in your hands but a lantern. The camera and flash-lights may well be left behind for a subsequent trip. Some magnesium ribbon should be taken, to light up large chambers. It is also useful in flash-light photography to get depth of background. In this case, the man who lights the ribbon should be well concealed from the camera, or you will get curious effects of forked lightning in your picture.

Other useful things that may be added to your outfit, if the party be large enough to carry them, are a cold chisel, geologist's hammer, bags for specimens, a dip-net for blind fish, a thermometer, and a pocket aneroid. To measure accurately the height of large chambers, carry some toy balloons with thread attached. But, on the first trip, at least, go light, with everything stowed as compactly and get-at-able as possible. Remember that you must use both hands in crawling over difficult passages, and in climbing or descending. Do not omit a ball of oiled tow or cotton. This is to be weighted with a stone, lighted, and cast into any sink-hole or chasm where you may fear fire-damp. This gas is only found in deep holes that have no draft, and is, I believe, never met in caves proper. The air of a true cavern is purer than that outside, and you can work harder in it without fatigue. One does not catch cold in a cave, whatever may be the temperature, unless he has been imprudent in entering before cooling off, or emerging too abruptly. In this respect, it is wiser to explore caves in winter than in summer. The temperature of a cavern is constant the year round, but that of different caves varies from each other. The extremes, I think, are about 45 to 60 degrees.

Most novices are afraid of meeting snakes or "varmints" in caves. It is a rather foolish dread, though natural. Serpents or beasts in caves of any considerable size are almost as rare as spooks. If, by extraordinary chance, you should meet one, it will probably be near the entrance. The only snake that I ever saw in a cave had tumbled in by accident when frightened. The only signs of wild beasts that I have discovered in such places were those of a woodchuck, and some bear beds made long, long ago. The newspapers once published a story of our killing a five-foot rattler in a cavern, and printed a photograph of the reptile for verification. The snake was genuine enough, but he was killed outside the cave. If you should encounter a wild beast underground, just flash your lantern in his face and scare him to death.

The only interesting mammal that I ever found in a cave was a white bat. In a small cavern chamber, Sid and I had paused, lost in admiration of the beautiful white incrustation that covered the rock above and all about us. Never, save after a fall of snow, when ice crystals glittering in bright sunlight heighten the effect, have I seen such dazzling purity of whiteness. As we gazed, Sid suddenly pointed to something clinging within reach above my head. It was a bat, virgin white as the roof from which it hung. White rats in caves I had heard of, but not of albino bats. Sid was of the opinion that the sudden appearance of such horrid, antediluvian monsters as ourselves, and our voices breaking the age-long silence, had frightened the poor thing until its hair turned white. We captured it, and confined it in an empty lunch box. An hour or so later, when we emerged, our first thought was of our prize, and how it would appear by daylight. Sure enough, it was white as snow. Some time later we exchanged it, and, to our astonishment, it had turned yellow. I took it home. The next day it was on every-night bat, of conventional color.

Some of the white incrustation of the cave, that I had brought with me in a bag, had turned to the color of iron rust, after exposure to the sunlight. I presume that the bat had been well dusted with it.

The difficulties encountered in cave exploration are analogous to those of mountaineering, save that you may need a boat, and you must depend utterly upon artificial light. It will not do to rope the members of the party together, for the way is often so tortuous that such a rope would be a nuisance, if not a positive source of danger. It is sometimes necessary to go hand-over-hand on a rope, and such exercise should be practiced before starting, unless one is already adept. In such maneuvers, and in crawling through narrow holes or crevices, go slowly and cautiously, one at a time.

It is hair-raising to have a man wedged in the rock so that he cannot move. I had one such experience, and it is enough. Some two years ago I discovered a "blowing-hole" in a wild part of Ste. Genevieve county, Missouri. When first found it was merely a 6 or 8-inch hole in the middle of a cattle trail. In summer a cold blast blew from it, scattering the leaves for yards around. The rains enlarged this opening until a man could lower himself into it. Five feet below the surface it connected with a crack in the rock that looked as though it had been rent asunder by an earthquake. This crevice descended at a sharp angle, but was too narrow to admit a man. Sid and I enlarged it with a cold chisel until, with a rope, a thin man could slide down edgewise. It went down at an angle for 20 feet, then vertically for 25 feet, and then connected with a cavern of comparatively recent formation. Later a party of seven men attempted to explore this cave. We were below from seven to nine hours, but did not reach the drainage level. It was when trying to get out that the "stick" came. Three men succeeded in climbing to the surface, but No. 4, when almost at the top of the vertical shaft, got one leg fast in a crack and could not dislodge it. The men outside could not free him, nor could we below, for we could not get at him. No. 4 was nervy, and did not whimper, but his position was unenviable, to say the least. His strength waned, but

he dared not let go the rope for fear of breaking his leg. Those of us below could not get out until he did. All the chisels in the county could not have liberated him in a week. Finally, by careful and gentle wriggling, the poor fellow freed his leg and reached the surface. And he wants to go down into that cave again.

Well, no sport is sport unless it involves some risk. It is something to know that your nerve has been tested, and that it has borne the strain.

HORACE KEPHART.

The Lodges of the Blackfeet.

(Continued from page 374.)

THE importance of the buffalo to all prairie tribes is, of course, well understood. It furnished them with food, clothing, and shelter. From its hide they made lines and cinches, and with it they covered their saddles; the sinew gave them thread for sewing; they carried water in its paunch and also boiled meat in it; its ribs and its dorsal spines gave them their knives, and arrowpoints and hoes were made from the shoulder-blades; cups and spoons and ladles were fashioned from the horns; the hide of the neck formed their shields and gave them glue for their arrows and their bows; the head of the humerus was used to rub hides to make them soft; they braided and twisted ropes from the hair; the brain was used for tanning, and the fat from the bones was eaten; if the people were troubled with certain simple skin diseases, they rubbed their bodies with the gall mixed with the contents of the paunch, and this cured them. It is not strange, therefore, that among the prairie tribes the buffalo was regarded as a most important protecting spirit, and was the chief among all the animals of the plain.

A sacred object of great importance—because connected with the food supply—was the buffalo stone or iniskim of the Blackfeet. This buffalo stone possessed in itself some power, which gave its possessor the ability to draw the buffalo to him. Buffalo stones were found on the prairie, and the person who succeeded in obtaining one was regarded as very fortunate. Sometimes a man while riding over the prairie heard a peculiar faint chirp, such as a little bird might utter. He knew the sound to be made by a buffalo stone, and stopped and searched for it, and if he failed to find it, marked the place and returned next day to look for it. If it was found he was glad.

These buffalo stones are usually small ammonites or sections of baculites or sometimes merely oddly shaped nodules of flint. It is said that if an iniskim was wrapped and left undisturbed for a long time it would have young ones. That is, two small stones similar in shape to the original one would be found in the package with it.

All this is of the olden times, and since there are no longer buffalo, the buffalo stone is no longer useful. Yet within a few years an old woman gave me an iniskim that had been in her husband's family for many generations, and told me that if I would rub this stone with the kidney fat of a barren buffalo cow, and pray hard, I should never be hungry.

There was a time, far, far back, when the people did not know about the buffalo stone, but at that time, in a season of great want and suffering, the first one was found. It was winter and the buffalo had disappeared. Heavy snows had fallen; so deep that the people could not move after the buffalo; so the hunters killed deer and elk and other game along the river bottom, but these did not last long, and presently they began to starve.

One day a young married man killed a rabbit, and since he and his wives and children were all hungry he ran home fast and told one of the women to hurry to get water to cook it. She went down to the stream and bent down to fill her bucket, and as she did so she heard the sweetest singing she had ever heard. It was near her, but she could see no one, and for a long time she forgot her water and looked and listened. Presently she took a few steps in the direction from which the singing seemed to come, and then it appeared that it came from a cottonwood tree close to her, and when she was near to the tree the singing sounded almost in her ears. She looked closely at the tree and saw wedged in the bark by a branch an oddly shaped stone, and with the stone some wool from a buffalo which had rubbed there. And now she saw that the song came from the stone. She was frightened, and did not dare even to run away. After a little while the singing stopped, and the stone said to the woman, "Take me to your lodge, and when it is dark call in the people and teach them the song that you have just heard. Pray, too, that you may not starve, and that the buffalo may return. Do this, and when day comes your hearts shall be glad."

The woman took the stone from the tree and carried it back to her lodge and gave it to her husband, telling him about the song and what the stone had said. After it became dark the young man called the chiefs and old men to the lodge, and his wife taught them the song, and they prayed as the stone had directed them. Before long they heard a noise, a rumbling sound, at first a long way off and gradually coming nearer. It was the tramp of a great herd of buffalo coming. Since that time the people have taken care of the buffalo stone and prayed to it.

Two of the most important lodges in the Blackfoot camp are known as the *In-is-kim* lodges. Both are painted with figures of the buffalo, and they came to the tribe long, long ago, "in about the second generation after the first people." Formerly all the Blackfoot tribes lived far to the north of their present home, yet these lodges are said to have been discovered near the place where the Siksikan now dwell. These lodges came to the tribe in the following manner:

One day, long, long ago, two old men, friends, had gone out from the camp to find some cherry-shoots, with which to make arrows. This was on Bow River, below the Blackfoot crossing. After they had gathered the branches, they sat down on a high cut bluff on the river bank and peeled the bark from the shoots. The river was very high. One of these men was named Weasel Heart, the other, Fisher.

As they sat there, Weasel Heart chanced to look down into the water and saw the top of a lodge and its poles standing there above the surface. He could not believe that what he saw was actual, yet it was broad daylight,

and, however hard he looked, the top of the lodge and its poles were there.

Weasel Heart said to his companion: "Friend, do you see any object in the water or on the other side?"

Fisher looked across the river and said, "I see only some buffalo."

"No," said Weasel Heart, "I do not mean on the prairie; look down into that deep hole in the river and you will see a lodge there."

Fisher looked as directed, and saw the lodge—it was the black buffalo lodge. "Oh, yes," he said; "I see it, and I see another lodge standing in front of it." Then Weasel Heart saw that lodge, too—it was the yellow buffalo lodge.

They wondered at this and could not understand it; but they were both men of strong hearts, and presently Weasel Heart said: "Friend, I am going down to enter that lodge. Do you sit here and tell me when I get to the place." Then Weasel Heart went up the river and took a drift-log to support himself, and pushed it out into the water and swam down toward the cut bluff. When he had reached the place where the lodge was, Fisher told him, and he let go the log and dived down and disappeared from view.

For a long time Fisher sat there waiting for his friend; but at last, after he had been there for half the day, he looked down the stream and saw a man on the shore—it

they cannot do so; let us try to make a crossing so that it will be easier for them." So Weasel Heart, alone, crossed the river and sat on the bank on one side and Fisher sat opposite him on the other. Then Fisher said to the people: "Pack up your things now and get ready to cross; I will make a place where you can cross easily."

Weasel Heart and Fisher filled their pipes and smoked, and then each started to cross the river. As each stepped into the water, the river began to go down, the crossing grew more and more shallow. The people, with all their dogs, followed close behind Fisher, as he had told them to do. Fisher and Weasel Heart met in the middle of the river, and when they did so they stepped to one side up the stream and let the people pass them. Ever since that day this has been a shallow crossing. These lodges came from the Under-water people—*Sú ye tuppi*.

Certain of the *In-is-kim* are kept in these lodges in little bags. They can be kept only in these lodges, and by these lodge-owners.

The yellow-painted buffalo lodge has, surrounding the border, at the ground, a black band, fifteen to eighteen inches in width, on which are painted a double row of white disks, four to six inches in diameter. These disks, called stars in my article in the *Anthropologist*, are not the stars of the sky, but what the Blackfeet call dusty stars, the term used for the puff balls which grow on the prairie and which when ripe seem to inclose fine powder

BLACK-PAINTED BUFFALO-STONE LODGE.

was Weasel Heart, who walked up the bank until he had reached his friend. Fisher said to him: "I was afraid that something bad had happened to you. I have been waiting a long time. You went into that lodge that you saw (the black buffalo lodge); now I am going to do the same thing, but I shall go into the other one."

Fisher went up the stream and then swam down, as Weasel Heart had done, and when he reached the place, he disappeared as Weasel Heart had disappeared, and the log he had been resting on floated down the stream. Weasel Heart waited for his friend as long as Fisher had waited for him, and when Fisher came out of the water, it was at the place where Weasel Heart had come out. He joined his friend and they went home to the camp.

When the two had come to a hill near the camp, they met a young man, and by him sent word that the people should make a sweat-house for them. After the sweat-house had been made, word was sent to them, and they entered the camp and went into the sweat-house and took a sweat, and all the time while they were sweating sand was falling from their bodies.

After this the people moved camp and went out and killed buffalo, and these two men took hides and built two lodges, and painted them just as the lodges were painted that they had seen in the river.

Now, the people wished to cross the river below the Blackfoot crossing, but as the stream was deep it was always a hard matter for them to get across. The dogs and the travois were often swept away, and the people lost many of their things. At this time the tribe wanted to cross, and Fisher and Weasel Heart said to each other: "The people wish to cross the river, but it is high and

or dust. The band close to the ground therefore represents the prairie or the earth. The ground color of the lodge is yellow, while the buffalo are brown. The bull is painted across the front of the lodge, the cow across the back. The pinning of the lodge passes down behind the bull's shoulders. In the bull, the hoofs, the two eyes (both on one side of the head), the knees, tongue, genitals, kidneys, tail, and horns are green. The life-line is red and green in alternate blocks, and the heart is green. A spot between the horns, and the insides of the ears, are red. The cow has the tail, kidneys, hoofs, ankles, horns, tongue, ears, two eyes (on one side), and the nostrils red. The life-line is red and green. In each animal the tongue protrudes; each is licking the rump of the other. Below the smoke-hole at the top is the butterfly cross.

The black buffalo lodge has the black band at the ground with a regularly-spaced double row of disks representing stars. The buffalo bull and cow are black on white ground. The bull is at the front of the lodge, its pinning passing down just back of the shoulders. The tongue, two eyes, horns, hoofs, front pasterns, heart, and genitals are green, the nostrils, inside of ears, a spot between the horns, the wrists, hind pasterns, hooflets, kidneys, tail spot, and hocks are red. The cow is similar, except that the tail spot is green. At the back of the lodge there is a green butterfly cross; the wings are black, painted with stars, and the points of the wings carry buffalo tails and hoofs.

The two lodges last mentioned are situated on the northwest side of the camp-circle, and are not far apart.

GEORGE BIRD GRINNELL.

[TO BE CONCLUDED.]

More Musings from Sand Lake

Why Eight Lines of Kipling's "Red Gods" were Brand "Spurious!"

Où la chèvre est attachée, il faut qu'elle broûte.

EIGHT or ten of your regular contributors have had good time rising to my "red gods" fly, and have extended themselves in protest at my strictures on Kipling's double quatrain, chosen from the whole "poem" by a friend as the least vulnerable. These apologists have not been prudent in husbanding their resources. Men who wished answer them have been asked by me to be silent. Weight of numbers and impetuosity of apology were used to diminish, if possible, the force of the criticism. Mr. Ascroft has drawn their fire admirably. Even Doctor Morris, whom I can never sufficiently thank for having sent me to the Serpentine, Bay of Islands, Harry's Brook and Bay St. George in Newfoundland, joins the apologist. Private letters from friends have advised me to admit that I "had been argued to a stand-still"—as if this were a mere contest, instead of a search for the truth. Other lamented the "unfortunate choice" for the attack, of the "truest" lines in "The Feet of the Young Men."

The Old Angler, whom I extinguished in the interminable sea-trout discussion, being deprived of a favorite theme to tilt with Mr. Hallock about in print, no gets Mr. Hallock to join him against me. Mr. Verning is all right under his crust. May his years, and those of Mr. Hallock, sit lightly.

I am satisfied that the great body of FOREST AND STREAM readers are not represented by the apologist who, I take it, represent a provincial defense of what is said to be a "poem" inspired by Maine woods.

In the torrent and onrush of apology, I find one generous foe—Hermit—who extends the *noblesse oblige* due to a fellow sportsman, no matter how ignorant and misguided he may be. Thanks, sir, for your courteous words—sincere, heartfelt—contrasting gratefully. Now I ask you to come out back of your Maine tent, face the west, and take the following wireless message from me:

My fellow fisherman, I am only an "ignorant," "senseless" Sand Lake angler, who has been angrily told by eight or ten of the writers for FOREST AND STREAM to be silent until I go and get some experience, and not dare to call Kipling's "word-picture" a "spatteration." If ever meet you, my first words shall be, "Have a cigar and what's your favorite moist joy?" You hail me with a friendly "Come east."

Brother, I've been east, and likewise have had guide, mostly Indians, pole me up over a thousand miles of swift water, and down nearly twice as many miles. Have been in Maine three times. Been to Moosehead, and from there by buckboard to the headwaters of the St. John River, and down that stream into Square Lake. Waded, paddled, poled and portaged from the line of the Bangor and Aroostook Railroad to the Soudnahonk and back, and had to pay forty dollars for the five day round trip with one guide. I saw at least twenty other canoes, going up and down streams in Maine; yet my New England friends think I must have been blind, for I never saw a "shod" (not sleeved) canoe-pole in Maine, nor anywhere except one pair at John Connell's camp on the Tabusintac in New Brunswick.

Brother, I am here at beautiful Sand Lake in Michigan, two miles from Pentecost Station on the Lake Shore Railway. I hire my boat all day for a quarter, and am living like a fighting-cock at a little "hotel" for a dollar a day. That saves me \$2.50 a day as compared with Maine. I need no guide, row myself. That saves \$2.50 more, a clear gain of \$5 daily by not coming east. Any when I and the small-mouth black bass are both of the right mind, I "ketch 'em to beat the band." No self important, oracular "guides" to charge me \$3 daily for intimating to me that they know it all, and taking me to places they want to go to and I don't, and who insist on using semi-handspikes that are tools of the lumber camps, and then calling them canoe-poles, and dubbing me an ignoramus if I say they are not. They are proud of that "click" of the log-driver's tool, which they have "worked in" on me as the genuine pole, and claim it can be heard a mile, and even exultantly cite a confessedly unknown writer in a Boston paper to prove it. Now, I ask you as a man and brother, do you think they don't want me to catch fish or shoot big game, and so use their shod poles in my canoe to frighten away all my fish "long before the canoe comes in sight," and mean to scare my deer and moose that way, by keeping them in a state of alarmed alertness and wonder about what naval fight is approaching? See? Besides, if I want to shoot a deer, they charge me a big license fee for the privilege of coming to their camps and spending a lot of money—charge for the privilege of even firing one shot that may miss. Worse, and unpardonable, they insist on branding me as a criminal as branded in Paris. They Bertillonize me taking my height, color of hair and mustache, beard and eyes. Insultingly they ask if I can write my name and record my answer. Then they actually sit down and do a lot of hard thinking, trying to spell out *why*, as I write this, their camps are so deserted of non-resident hunters whose lovely cash they meant to get.

Brother, you invite me to come east. I've been east. Pardon a hospitable suggestion. Suppose you come west instead, and really see some Indians, camp-beds and canoe-poles. Come on, to the lakes and streams of the Kootenai Country, to Slocan, Arrow, Okanagan, Harrison, and Sugar and Mabel lakes. Come to Lake Chelan, Crescent and Sutherland, in Washington, and see Mt. Olympus glassed in the two latter. Come to Two Medicine and St. Mary's lakes, to Crow's Nest Lake and the Elk River. You shall take blueback Beardslee trout that weigh 15 pounds each. You shall find plenty of Indians that are not smoky and that cannot be "smelled further than you can smell Limburger cheese." Come on, to the Frankfort lakes of Michigan and see unshod canoe poles on the swift Platte River; come to the Fifield lakes of Wisconsin, the Alexandria lakes of Minnesota to Lake of the Woods and Lake Winnipeg. I have fished in all the waters named, and have camped on over half of them. Better yet, come to the Campbell River and Cowichan Lake on Vancouver Island. If you want

A—BLACKENED TIMBER.

blackened timber you shall see it by hundreds of square miles. Or, best of all, sleep beside me in a tent by Emerald Lake north of Field, and we will take a day's journey and see the Yo Ho Cañon, and Takakkaw Fall taking its sheer, snow-white plunge a third of a mile, and look at glaciers around which the bighorn sheep browse, and everything sticks up on edge about a mile and a half. You will not see even one pair of shod canoe-poles in all your trip. Or if you want to try and crawl into the barrel of your gun, nothing is easier than to take you to another world of camping and angling waters, the great Shuswap Region, with Anesty, Seymour, Main Arm and Adams lakes and their streams, where mountains are nearly two miles high, and lakes often 1,200 feet deep. There you can get introduced into society—of the silver-tips, cinnamons and grizzlies, who will charge you on sight, and favor you with a "swipe" you will remember if you survive. During eleven long summers of delight I saw all this, if I am a Sand Laker now. See them yourself; I will get you a round-trip pass over the Canadian Pacific Railway, and you will come back asking, "Where is Maine, anyhow?" Or come and dine with me when I return to New York, and we will sneer at Sherry's menu, and agree it is not "in it" with the roasted fool-ben and fried trout in the woods where we don't wear white handcuffs and breast-plate shirt-fronts under white ties, nor make ourselves black grasshoppers in clawhammer coats. And when you are old, join us in a tent on the little Slagle River in Michigan, probably the best home of wild, natural beauty in all the world. And then I'll cry *peccavi* if you also do not insist that a man who was well known not to be a canoeist, camper, angler or sportsman, was a fakir when he presumed to misadvise you that the feet of all the young men are "turning" to his patch of "blackened timber" that he happened to see when some Maine sportsmen entertained him, and where he seems to have been visited by a counterfeit "heavenly muse" that embalmed him with a "divine afflatus" so he might steal your tent over your head, and make you sleep in starlight or rain and fight mosquitoes and gnats, make from it robes that, Dowie-like, he gets on wrong-side out and hind-side foremost, and then write a fake "poem" of "universal application."

Then you will join me in pointing "the slow, unmoving finger of scorn," and crying "Mountebank!" when such a man coolly asks you, "Do you know" some unlocated, swift stream where all the log-jams are "right-angled," and "bars" are of "shingle?"

I review this, for it is vital. Some years ago a man went to Brattleboro in Vermont, married there, made a visit or two to Maine, and was entertained by Maine sportsmen, as I am told. He had secured some notoriety as a writer of swashbuckler rhymes about soldier life in barracks, his work in that way being recently characterized by the London Athenaeum as "amazing intellectual vulgarity," "fitted for the music halls, or for exponents of cheap materialism, and philistine admirers." It was well understood that he was not a fisherman or woodsman, canoeist or camper. He was a literary hack, everything being grist that came to his mill. And he planned a "grand" "poem" which the Maine folks should accept as coming from a new Elijah, a High-priest of Nature at whose feet all sportsmen should sit in admiration. The possibilities of the wild and beautiful should be exhausted; nothing should be lacking in the spellbinding picture of the angler and his camp of beauty and grace.

Mind, this "poem" was to be the record mark, superb, the very apotheosis and quintessence of the beauties and hypnotism of the joys of angling. And that is what his apologists call it in these columns—that no picture known to them is so lovely, sweet, grand, vivid, and true!

He, an ignoramus of the camp, was to write for the delectation, instruction and joy of even the especial sportsmen and woodsmen who had made Nature's real beauty and grace a humble study for a life-time—for men who welcomed and searched for any one who could write with the heart and eye of the beholder with knowledge about their loved domain. No Cagliostro of sport

could safely sweep the harp-strings for them. They themselves loved best to admire and worship with mute lips, and only talk of it all with their hearts, for they knew Nature should be studied rather than described by puny words. Over them always was the sense of impotence to tell of what they saw and felt. And when a passer-by, seeking his own glorification and cash profit, assumes to enter their temples and fill their forest cathedrals and dim aisles with false notes, they are not merely indignant, but furious. For all this is to them a sacred thing, almost their religion, as it is a reverent form of worship. They are jealous of this realm, and no vandal hand can be permitted to smirch it unchallenged.

If this were not a sportsmen's paper, all that I have so far said would be omitted. The eight lines attacked are now quoted by me, I hope for the last time, for I am always pained to look at and feel their falsehood. But

first I repeat that Kipling was a fakir when he wrote them—that I claim him to have been a megaphone "word-artist" flinging a potful of language paint on a canvas, and demanding that real lovers and beholders of Nature's loveliness should admire his "splotteration." I am glad that Mr. R. W. Ashcroft, himself the editor for some years of a sporting magazine, and who has just returned from a long canoe-trip with two Indian guides in the back wilderness of Ontario, has had the courage to face, single-handed, the storm of protest and apology. I indorse his every word, and thank him. As it is now claimed that the poem describes only conditions in Maine, his world-inquiry about canoe-poles, already fairly complete, need not be pursued further; and I have asked him, with thanks, to discontinue it.

Here are the lines under discussion:

"Do you know the blackened timber? Do you know that racing stream,
With the raw, right-angled log-jam at the end;
And the bar of sun-warmed shingle, where a man may bask and dream,
To the click of shod canoe-poles round the bend?"

It is there that we are going with our rods and reels and traces,
To a silent, smoky Indian that we know;
To a couch of new-pulled hemlock, with the starlight on our faces,
For the Red Gods call us out, and we must go."

In point of fact, this is applied to angling sportsmen and the camps of the entire world. Kipling puts it into his book, "Five Nations." As Newfoundlander states, he was "not short-sighted enough to localize what was meant for a universal picture." And mind, in the very title to the poem, Kipling says by implication that the feet of all the young men in the world are "turning" to his "right-angled" log-jams and "blackened timber," when nothing can be more manifest than that not one young man in a hundred has the spare time, and cash, and the inclination, to go into a camp.

Now, take the false lines, one by one, and follow them:

"Do you know the blackened timber? Do you know that racing stream,

In the three very first words, he uses one of his favorite tricks—mention of something he knows the reader cannot be supposed to know because it is not located, and which it was his duty in fairness to locate; yet which he assumes credit to himself for knowing about while the reader does not. This is cheap "mystery." No poetic license can justify the placing of the reader in a condition of pre-arranged ignorance, and then impliedly placing one's self on a pedestal of superiority because the reader has not been informed of what the writer himself does not disclose, but pretends to specify, knowing all the time that he does not.

But a horrible, vitally offensive choice is made in the next three words. Note how the line-up of Kipling's apologists, basing their defense on the unimportant point of shod or unshod canoe-poles, is swept away by the offensive display of quick environment for the angler in the words "the blackened timber." These are vital, and

B—LEAVING A CAMP—A LAST LOOK AT THE SLAGLE RIVER.
"Good-by, Sweetheart! Good-by!"

"And from the stream I turned away,
But heard it many an after day."—CLARE.

brand all eight of the lines as false work. For "blackened timber" is chosen as the ideal camping site—the *ne plus ultra* of angling delights in a camp!

Here is a picture (A) of typical blackened timber.

Now, instead of the deliberate mischoice of the quack sportsman, see in the next picture (B) what a real beholder of Nature regards as beautiful for a camping site. I shall not offend readers by asking which site they prefer.

But in this line is further false work. The "racing stream" is not the ideal stream of the angler, being too noisy and full of tumult. There, no water-music reigns and thrills, but only a perpetual roar. It is too full of rocks, too difficult to ascend. The real paradise of Nature for the angler is a big brook like Temnyson's (I defy any critic to show faults in those lines) with rifts and eddies and still pauses, and liquid water-breaks as described by Camoens:

"Sonorous now it rolls adown the glade,
Now, plaintive, tinkles in the secret shade.
Now from the darkling grove, beneath the beams
Of ruddy morn, like melted silver streams,
Edging the painted margins of the bowers,
And breathing liquid freshness on the flowers."

Let the apologists here who say that no poetry can stand the test of "hyper criticism," try their hand on *those* lines. It is the sort of stream which is ideal for the camper and angler, the stream that lingers around roots and

"Purls and murmurs as it moves,
In circles round the tree it loves."

I give herewith a picture of a perfect angling stream. The next line contains three vital errors:

With the raw, right-angled log-jam at the end,

I thank Mr. Jaques for demanding that the apologists answer in unison the questions: What are "traces" in

their formation, so long as Kipling tells them they are. I cannot discuss such a manifest error seriously.

It is rare, indeed, that even two logs lie together in a jam, and form a fairly accurate right angle as to those two logs alone. Only the sportsman of the subliminal, he who appeals to things below the threshold of his consciousness, can make a whole log-jam right-angled to itself; for Kipling states it is so *in esse*, not specifying anything else to which it might be right-angled, as it would not be anyhow. He merely evokes from the potentiality of matter, another phantom and hocus pocus.

The apologists realize now that Kipling's line does not state that his log-jam is right-angled to the shores of the stream; but in the more recent unfoldings of this discussion they have discovered it will be most plausible to say he meant that. This merely changes their dilemma. As shown above, such a condition of a jam cannot be described by the one compound word "right-angled," but only a jam that is right-angled to itself, like the log house of Dixmont's counterfeit *reductio ad absurdum* that Mr. Hoyle exposed so happily. Yet it is predicted with confidence that, having found this best "construction" to put on Kipling's word of misdescription, the apologists will now claim that the jams shown in Mr. Hardy's pictures were never asserted to be right-angled. Then to show them in a discussion over the word was absurd. Even if Kipling's jam formed a straight line of logs squarely across the stream from bank to bank, the one word "right-angled" could not properly be used to show the jam was right-angled to the lines of the banks. Besides, it is insisted with utmost emphasis that even if the word could be so used, it would be almost a miracle to find such a jam, and that an undoctored picture and jam cannot be shown that would justify that "construction" of the word. Mr. Hardy, Hermit, Doctor Morris and others declare that all or nearly all jams

states that the logs in jams lie at all angles, so a whole jam must be right-angled! Mr. Venning defies any one to call "hung up" logs a jam; and then proceeds to thank Mr. Hardy "very hearty" for producing the pictures of just such logs and labeling each, "A Maine Log-Jam"; while Mr. Biddle also thanks him for having "cleared up all these questions." Mr. Ames now asserts that the lines were written about Maine only; while Newfoundland declares that Kipling did not make the mistake of localizing them and they are a universal picture. Mr. Ames says a jam may be found in a cove; others say with Hermit that it must span a racing stream. Several say in substance that the sportsman is pleased with the clicks of the shod poles, while Mr. Keim is equally sure that the chances of getting game are increased a hundred per cent. if the hunter gets away from those clicks. These inconsistencies could be much extended. It is a Babel of cross-tongues. So many men, so many minds; their statements are honeycombed with contradictions! Gentlemen, *ajustes vos flûtes!*

And the bar of sun-warmed shingle, where a man may bask and dream,

Here I agree that if, as Mr. Venning noisily contends, the racing stream "moves boulders of ten or fifteen tons hundreds of yards," then it is possible for that stream to throw up "shingle" into a bar. But to sit on this uncomfortable, angular shingle or stone, look at blackened timber, and bask and dream, would be extremely bad taste in the sitter, and his dream would be a pipe-dream.

To the click of shod canoe-poles round the bend?

I have often had canoes pushed up quick water by guides that had no real canoe-poles, but only used iron-shod semi-handspikes, often with a hook on one side, whose primary purpose (that for which they were really made) was solely for use as a *log driver's* tool, not a pole whose sole use was intended to be for pushing canoes up quick water, and never to be used for driving logs. Only such poles are genuine canoe-poles. I have been on the St. Johns River in Maine, and both Cascapédias, the Restigouche and Tabusintac in New Brunswick, the whole length of the Peribonca River in Quebec, and up the Albany and English rivers on the north side of Ontario, and I never saw a shod canoe-pole on one of them that was a *sportsman's canoe-pole*, and not primarily intended for use around lumber camps in the hands of log-drivers, instead of real guides. It is all very well to write of "synchronous strokes," "rhythm of shod poles," "pretty music," etc.; but the men who joyed in that noise heard log-drivers' tools instead of the actual poles of the sportsman. Besides, I cannot for a moment admit that the "click" of even the shod pole can be heard around the bend of a noisy stream. I hold many letters denying it.

Mr. Hallock, collaborating with his former opponent in the sea-trout matter, says, as quoted by the Old Angler: "I have never seen either an ash or maple canoe-pole."

Very well. I quote from two letters before me, written by the best posted actual woodsman in Maine, Mr. D. E. Cummings, the owner of the famous camps on Square Lake: "Canoe-poles used by guides are from twelve to fourteen feet long, made usually of *ash or maple—white ash preferred*—and diameter about one inch at each end, and one and a half inches in the middle."

He says further: "Canoe-poles used by river drivers for *driving logs* are made much on the same principle as canoe-poles, only they are a *third larger poles for driving logs*."

Now let the Nestor of the Old Guard and the Old Angler quarrel it out with the best posted man on this subject in all Maine. His two letters are sent to you herewith, and be it remembered that this shod or unshod pole question has no more relative importance in excusing Kipling's false work than the end of a pole has to "blackened timber."

I met Mr. Hallock on the north shore of Lake Superior in the late sixties; and last month he honored me with a long, greatly prized call, during which I was much impressed with his ripe culture and *noblesse oblige*. Yet this founder of FOREST AND STREAM and prince of American anglers has been induced by Mr. Venning to be quoted in the discussion as charging me with general ignorance (for that is what his quoted words mean) because I have never seen but one *shod* pair of *real* canoe-poles. It is therefore submitted to him that, as he says, he has never seen an ash or maple canoe-pole, while Mr. Cummings (a much better special authority) says such poles are usually made of maple or ash, it might with equal force be asserted that Mr. Hallock's knowledge is limited. Will he claim that because this discussion has demonstrated what I have never denied and freely admit, namely, that *some* canoe-poles that are *real* canoe-poles are actually "shod," it follows that all the other detailed and proved charges of vital misdescription in Kipling's eight lines have been refuted? Is he willing to go on record as saying that the sections of spinning-tackle known in some regions as "traces," are used by anglers on racing streams in connection with rods and reels, as per Kipling's assertion in one of his lines? Let him remember that Kipling says: "It is *there*" (to the racing stream) "that we are going." Any mere tyro of angling knows that traces are not used on racing streams. Will he demonstrate that log-jams are right-angled, and "at the end" of racing streams? Mind, the red gods "*call*" or summon out, not *drive, send, or impel* out, *so they are alleged to be something apart from one's self*, and must dwell where they call from. Will Mr. Hallock make an affidavit that crimson beings whom he has actually seen, heard, and can describe in detail, live in fire-destroyed timber, and that such timber is the ideal camping-spot rather than a happy, magnificent forest; and that all "young men are turning" to such timber, "where the moon shall be confounded, and the sun is ashamed?" Will he deny the accuracy of the words of Jeremiah: "*For the habitations of the wilderness are lamentation, because they are burned up?*" And does he not see that he cannot afford in his advanced years to mar his great reputation by sanctioning advice to "young men" which is really as follows when paraphrased:

Come, all ye longing campers, to the grime and ashy soot,
To horrid, nightmare vistas without end,
Where trees that once were happy have been stripped of leaf and fruit,

AN IDEALLY BEAUTIFUL TROUT STREAM THAT DOES NOT "RACE."

Remoteness, Nature's dearest nymph, and Beauty wild,
Clasp hands in love where, in my sleepless bed,
I sing and play in laughter, like a happy child,
Fond Earth beneath, sweet light and air o'erhead.

connection with rods and reels? What is a "raw log-jam?" What is a "right-angled log-jam?" What does "at the end" mean? Let them avoid answering in concert, and make their replies plain and so they will agree.

No log-jam was ever raw in its physical character, not even when its logs have all lost their bark. But it is claimed that it is "raw" as a blemish on the landscape. To assert this is to disprove it. More, no log-jam was ever right "at the end" of a racing stream. Here again it is sought to shield Kipling by stating that where a log-jam (sometimes) chokes and fills the entire width of a stream, it *seems* to be at the end of the stream—that is, the river ends where it does *not* end. This is ingenious, but not ingenuous, like tying knots in a rope and saying the rope ends at each knot. It is "getting away from the bull and falling into the ditch."

Before me are pictures of British Columbia log-jams, but I do not need them, preferring to work with Mr. Hardy's own tools. I ask that his two pictures of such jams be reproduced here. He claims that the pictures show the jams to be right-angled. He sends them to FOREST AND STREAM for that purpose. One is a picture of logs *parallel* to the bank or shore; the other is a fantastic pile of logs not spanning a fourth of the stream (not at the end of it), and sticking in all directions! Both, so different in form, are given to show that both are right-angled!

Doctor Morris instructs us that *his* jams are all right-angled. Let him take the two pictures to a college professor of geometry and ask him: "What is a right angle?"

"When one side or line of an angle is perpendicular to the other line or side, it forms a right angle," the professor will reply.

It would indeed be a daring Doctor Morris who would then say:

"Well, sir, the log-jams shown in these two pictures are right-angled, although so different from each other. You are an ignoramus, sir, and must be blind!"

It would be worth much to see the face of that professor as he grasped the delicious humor of such a claimant taking himself seriously. Yet this is "sweet" description by the "genius" of the New Englanders. With them all log-jams are right-angled, no matter how varied

form that way. Then let them send a photograph of even one such jam to FOREST AND STREAM. Mind, it must show a jam whose upper line lies straight and squarely across the stream, and forms a right angle sharply with each shore-line. No differently formed jam is right-angled with the banks.

And here, as well as anywhere, note how Kipling's misdescription and lack of description involve these apologists in hopeless contradictions—strand them on a bar with their statements sticking in all directions, like logs in a jam. Mr. Jaques must smile as he realizes how easily he could make a little table showing these contradictions, and how crushing its facts would be.

Mr. Hardy's pictures (I have asked you to reprint them), totally different, are supposed to show how right-angled log-jams form, and they show nothing of the kind. Their "rearing up" is supposed to have some connection with their being right-angled when they span a stream. Now Hermit declares that a right-angled jam is only one that crosses the whole stream. In other words, the stream itself, and both banks, must not only be *actual parts of a right-angled log-jam*, but the upper line of the jam must be free of logs that "rear up," and be exactly in line across the stream; and the banks themselves, and the edges of the water, must all stand in straight lines—something no man ever saw. Take a far more favorable illustration for the apologists. Suppose a pole were laid exactly across a newly cut ditch with water in it. A man would be daft to call that pole a right-angled pole. It could not be until it had made both banks and the water between them a *part of itself*.

But the Old Angler is more absurd. He seems to think it will tend to prove log-jams can be right-angled if he quotes from some former essay by himself which states that some special logs in a jam can form scalene and isosceles triangles!

Mr. Fowler asserts that the red gods are one's own blood, and then naively inquires if they may not be the trout and salmon, thus ignoring all the other fishes, and the wild animals and birds. Several others assert that these scarlet phantoms live in blackened timber. This groping is caused by the "exact," "matchless" description so admired by Mr. Biddle. Mr. Cristadoro

Where foliage-stir and wind-sigh never blend!
For all "young men are turning" to this graveyard of the graces,
To a Kipling Eden with its gloom and pall—
To blackened timber "sweet and pure" to smear their hands and
faces,
While red gods, non-existent, bark and bawl?

And is it not manifest to him that this Kipling "picture" was inserted into "The Five Nations" as being "of universal application," as the Newfoundland apologist justly states, and that all the good sportsmen who have risen in anger begin to realize their danger unless they claim, as they have now decided to do, that only Maine was meant in the lines?

It is there that we are going with our rods and reels and traces,

Note the statement that it is *there* that "we are going." Now, a "trace" is a section of spinning tackle that is never used on a racing stream. Even the stubborn, pugnacious Scot of eighty-three years is forced to admit this.

MR. HARDY'S "RIGHT-ANGLED" LOG-JAM. NOTE THE LOGS IN PARALLEL LINES ALONG THE BANK.

Yet Mr. Ames declares that the whole eight lines are "right as a trivet!" Why not have all the "young men" take to the blackened timber and racing stream a full outfit of heavy "jigger" triple hooks, weighted for taking the codfish of *salt* water? This is again Kipling's "wonderful accuracy!"

To a silent, smoky Indian that we know—

I have probably seen more Indians, singly and in camps and reservations and villages, than all these gentlemen. They were always dark skinned, often dirty, and sometimes smelled of bad whisky or worse tobacco. But "smoky," no! And suppose they were. Assume, as Venning declares, that one of them can be smelled "further than a man can smell Limburger cheese." It would merely prove further Kipling's lack of a true sportsman's taste. None of the gentlemen who have apologized for the lines would want such a guide; yet they say that Kipling's choice of such a guide in his Elysium of a camp is delightful. Charming, indeed! A "bar" of shingle (rough stone) to sit on, "blackened timber" for a view, and a

MR. HARDY'S ENTIRELY DIFFERENT "RIGHT-ANGLED" LOG-JAM.

Limburger cheese Indian to make a couch, pitch a tent, and to cook; and all the while the sportsman must pray for a strong wind between which and his ideal guide he must keep or be nauseated. This is woodcraft with a vengeance!

To a couch of new-pulled hemlock, with the starlight on our faces,

My experience has been that a bed of hemlock for a camp gets hard after a night or two is spent on it, for it heats under the sleeper, and sours, having a most disagreeable odor, acrid and unpleasant, always afterward. Also that the camper always tries to avoid dews, rain (mind, that this is a *camp*), blackflies and mosquitoes. That alone is the ideal condition. The man who is established in a real camp actually sleeps inside a closed tent, or as much as possible under a canoe. If gentlemen wish to get starlight on their faces and be bitten by the Maine insects and get wet with dew and rain, they are doing something outside of regular camping customs, and certainly not "ideal."

For the Red Gods call us out, and we must go."

I cite Mr. Ashcroft's admirable words:

"Red Gods," are pompous poetic license gone mad. No "gods" of red, white, black, Prussian blue or chrome yellow, or of pepper-and-salt or brindle, "call out" the woodman. But wild Nature does beckon to him. Her blue lakes, emerald forests, music of streams, plashing of waves on beaches, wondrous saffrons and grays and tenderness and delicacy of purples at dawn, voices of foliage and

winds, evening twilights, and above all, the mystery of her life, are not deities of any hue, much less "Red Gods." They are manifest messages from the only God, telling us of blessings, beauty and grace of the earth made for man's enjoyment.

If the word had instead been "wood-gods," that would have been permissible by poetic license, just as nymphs, fauns, satyrs, and dryads might properly be mentioned, for then they are understood to be mere mythological immortals—intangible, figurative. But when a *color* is given to "gods," it carries with it the absurdity that they have actually been seen, and are tangible actualities. So it is in order for Doctor Morris to advise us which of the very many shades of red (see Standard Dictionary, under "Spectroscope," page 1722, *et seq.*) is the proper shade in which to regard these scarlet deities, and the true style for them. Perhaps Dunlap would like a hint from them on the style of a hat. Are they tall or squat, bow-legged or knock-kneed? Do they wear boots, slippers, waders or sabots? Do they range through the blackened timber in troops, singly, or in pairs or quartettes? Do they get the seats of their crimson trousers black when they sit or sleep on the coal-black timber? Are they red clear through, or only on the skin outside of themselves? But why ask questions when the answer is so easy? The Doctor should write his "old guide Caribou Charley" to shoot a couple of "gods," and express them, packed in ice, to FOREST AND STREAM, 346 Broadway, New York, charges collect.

Or perhaps the withering flames that have left a black desolation and ruin of the timber, have scorched its spook gods red, like boiling water does a lobster. Or is that melancholy landscape of fire-swept woods really a new Forest of Arden, where the horrible appears beautiful as Bottom did unto Titania, and all because the juice of the Kipling love-in-idleness has been rubbed on the eyes of his votaries?

I hope that Doctor Morris, so famous as a keen student and scientist, will favor us with a special paper on "Red Gods," to remove our belief that the term is cheap grotesquerie. Let him remember that "a musk-grain of Belief will flavor a whole world of Quackery," so men fill themselves with the East Wind. Let him ask himself whether Kipling knew how capable men were of self-delusion, of their "trembling delight in the 'occult,' enigmatic duskiess and dust-clouds;" and if that is not why Kipling dabbled into psychic research, clairvoyancy, and looked into crystal balls and pondered on the incantations of the "medicine-men." Let him read the statement in Genesis that "out of the ground made the Lord God to grow every tree that is pleasant to the sight," and then ask himself if it is not an insult to the taste of every God-fearing woodsman to weave a picture of a forest of *burned* trees haunted by "red gods;" and if it would be any greater tax on the reader's credulity if it were claimed that, through these spook gods, the sportsmen may hold trance (whisky) communications with the moose in his lair and the salmon in his hiding-place; whether such work is "world-thrilling genius," instead of being identical with the phosphorus-pictures of the quack spirit-medium, and the lies of the gypsy, who, for a fee, tells credulous girls to "beware of a light-haired man;" whether it has not taken stock of the myriads of human beings, often even cultured and renowned, who can be "incipient energumens of the lunatic asylums;" and whether these "gods" with gibberings that "call," are not mere jack-o'-lanterns of bathos, flittering over the fens of Superstition.

Not one man of fifty sportsmen and scholars asked by me, could tell what Kipling meant by red gods. His apologists have been very shy, as Mr. Jaques points out, about giving any details about them. Several puzzled men have asked me what Kipling meant by them. I claim that he meant nothing but a wish to profit by deception, and therefore named only mystic, fake nonentities. This false mystery dodge, as I have already stated, is a favorite trick with him. By means of its use he can pose as a Sir Oracle, proclaiming from out the vagueness of the mist he purposely raises, that he knows what his readers do not know, and which does not exist, but which he is anxious to gull people into wondering about as probably existing in a way purposely left unexplained. Mind, I do not apply anything to him in this article that I have not demonstrated from his own words he has branded on himself.

No doubt he would wish that he had been saved from his friends in this discussion. They praise "The Feet of the Young Men" as Kipling guards and healers on the Dowie plan. That "poem" is one of the "gems" of his new book, "The Five Nations," which so conservative and competent an authority as the New York Evening Post scores *editorially* as "mannerisms," "cheapened," "something very like scolding," "disconcerting clatter," "professional flavor," "conscious of his audience," "dogmatism," "decadence," "Sir Oracle," "doggerel," "professional unction of the exhorter," "empty forms of words which lack even resonance," "attempting to play the part of a thinking man without taking the time for thought," and "You may no longer print so much as two couplets without appending a formal 'Copyright by Rudyard Kipling.'"

This is my final mention of this matter. If I have offended my real fellow sportsmen, I deeply regret starting the discussion, for I had rather have the good will of my brother anglers and hunters and campers, than to unmask false work by my writer.

It seems that the "true" Nature Poetry must be a hodge-podge of Realisms gone mad and muddled Mystery that is false. The world is all wrong about Nature Rhymes! Shelley has been vastly admired for his "sweet views imaged by the water's love of that fair forest green," and for his dim, leafy vistas "where the Twin Sisters of Silence and Twilight keep their noon-day watch, and all the cheated hours sing vespers."

But he was wrong, of course. Solomon's marvelous descriptions of freshly berobed Earth; David's green pastures and still waters; Homer's goodly trees and pleasant fields; Virgil's wonderfully beautiful Elysium; Firdausi's world gay with many-colored flowers; the bulbul singing in the palms of Hafiz; Tasso's exquisite word-picture of the beauties of the Island of Armida, and Cameens' harp-strains about the perfect Isle of Love; Shakespeare and his violets blue and daisies pied, and green fields of which dying Falstaff babbled; Clare with his thick and spreading hawthorn bush; Wordsworth and his violet

by a mossy stone; Burns and his milk-white thorn that scents the evening gale; Byron's land of the cedar and vine; Scott's rows of stately elms and Moore's exquisite Nature and Love tales of "Lalla Rookh"—all these are not true Nature Rhyming, but, as the Old Angler says of a description by Ruskin, are mere "gush!" For a soul-stirring rhymester, put Kipling on a rough boulder up in Maine to look at a blasted forest of desolation, through which roars a racing stream which "ends" every time there is a log-jam, which, in turn, must be impossibly raw and right-angled. Add intolerable mal-cords exhaled by an Indian guide, and the rhyme-picture is the "sweet" work of a "genius" that describes earth's greatest, wildest loveliness!

The situation is most instructive, and painful to me. Here are a dozen earnest, surprised, hurt fellow-sportsmen, all sincerely protesting (some angrily) at what they fully believe was an outrageous attack. They love the woods, and deem the eight lines to be wonderful poetry. Yet here is a little editorial from the New York Sun, for years Kipling's best newspaper friend, in its evening issue of the 13th instant, about the very book that contains "The Feet of the Young Men."

"Mr. Kipling may be many things: he is not a poet," says the Saturday Review, of London. If he has read the notices of his last book of doggerel he may well adapt his own line to his own case and say

"I have had a jolly good lesson, and it serves me jolly well right."

I repeat, it is a great regret to feel I have wounded brother anglers, campers and canoeists; and I have lingered in longing over Kelpie's suggestion that we do but look at opposite sides of the same shield. But no, it is absolutely clear to me that the lines are false work, and so I have no choice but to denounce them. I can only wish each of these gentlemen a long, happy vacation, "loose an' free" in camps where remote forests guard lakes and streams. They will answer here as FOREST AND STREAM may choose to continue the discussion. But, anyhow, from friend and foe I claim the sportsman's privilege. All who have differed with me here, and all other FOREST AND STREAM readers who love the woods, are cordially invited to call on me when visiting New York, and permit me to furnish a chop, mug of ale and cigar over a lunch-table.

L. F. BROWN.

The Red Gods.

Editor Forest and Stream:

I have been following with some interest as well as amusement, the controversy carried on in your columns for some weeks in regard to Kipling's "The Feet of the Young Men." It is unlikely that the poet's fame will be lessened to any appreciable degree by the adverse criticisms of Mr. Brown and Mr. Ashcroft. To those who have any accurate knowledge of nature and her ways, and of the actions and methods of men—civilized and uncivilized—any justification or explanation of the poem referred to is wholly unnecessary. But as a matter of fact, the writer, having in mind, perhaps, that there would be those to read it who had not, like himself felt

"The old spring fret come o'er you,"

gave some inkling of the atmosphere and locality of the poem and its main incidents.

It is somewhat unfortunate, as I think, that the poem, as it appears in "The Five Nations," does not give the key or introduction, as it was given when it first appeared in Scribner's of December, 1897.

The late W. Hallet-Phillips had then only recently died, and Kipling wrote in memory of his friend, who was himself somewhat of a traveler. The introduction, if we call it such, was as follows:

"Mingan River, May 26.—Antoine shammed sick when C— came up this week. He, of course, is waiting for L—, and intends to take him further along the north shore, where they are running by millions."

Medicine Hat, June 18.—Bill White says he is not going to guide any more fools who can't shoot, and wants to know if H— comes out this summer. He has some new ground marked.

"Camp Bunji, via Astor, July 1.—Birkett has snuffed the best tracker in the M— gullies and goes on. He is trying for the Pamirs, I hear."

"Southampton, May 6.—As my young gentleman has just put her in commission for cruises in northern parts, and am going with him, am unable to accept any engagements in home waters this summer. Respectfully, etc."

"Macassar, Feb. 19.—You will not get any men from that village if De V— has been before you. The head-man is his blood-brother, and is taught to know rival collectors. Even the boys will not collect, and it is impossible to get skins."

If the adverse critics of the poem will take the trouble to understand the writer, and to familiarize themselves with the locality named, and others with which Kipling is as familiar as he is with his own doorstep, they will perhaps appreciate his universality, as exemplified in this product of his genius. If not, all I can say to them is:

"Who shall meet them at those altars—who shall light them to the shrine?

Velvet-footed who shall guide them to their goal?

Unto each the voice and Vision; unto each his spoor and sign—
Lonely mountains in the Northland, misty sweat bath 'neath the line,

And for each a man who knows his naked soul!"

Let our critical friends go study with them, and may they soon feel the truth.

Natural History.

The Starling.

NEW YORK, Nov. 13.—*Editor Forest and Stream:* It is not so very long since I read in an issue of your publication some remarks about the conduct and habits of the descendants of the recently imported English starlings, which seemed to me not at all in accordance with what I knew of such birds in their own country. Of course starlings are messy birds around their nests and when they build, as they so often do, under a roof between the slates or tiles and the sheathing, the point of entrance and exit under the eaves is most unsightly after the young have been hatched. The cheers with which the young ones greet every arrival of the old birds cannot be said to be anything in the nature of a sedative, and as the old birds go to work getting breakfast very early in the day, each trip of the parents becomes a source of great annoyance to anyone who may be unfortunate enough to be located in a bedroom under that part of the roof selected by a pair of starlings for housekeeping purposes. I speak feelingly.

Outside of the above I cannot recollect starlings being objected to. They worked hard and cleared lawns and pastures of myriads of grubs of a large size, being more particularly busy when they had young to look after. Visitors to Central Park can easily recognize the few specimens to be seen on the lawns there during the early summer, as they walk and run about in a manner entirely different from the hop-hop of robins.

In our fruit gardens thrushes and blackbirds were real pests while fruit was in season, but I never remember to have taken a single starling out of the nets spread over strawberry patches, currant bushes or hung from walls on which cherry trees were trained after the English fashion. Robins and blackbirds aplenty have I handled that were caught in such nets, but never a starling. When, therefore, I read a complaint of the fruit destroying habits of starlings in this country, I pooh-poohed the matter, but luckily kept my pen quiet, for in the London Field, published in London, England, on Oct. 17 last, I came across an article which I read with the greatest interest, not to say astonishment, and which I hand you herewith for your perusal and for reproduction if you think fit. The last paragraph seems to me to be very instructive, suggesting as it does possible change of habits of birds in adopted countries. But may it not be possible that the serious damage done by starlings in Australia, cherries, apples, pears, grapes, apricots, etc., all coming alike to them, may be largely due to the extremely dry climate which parches the soil and prevents the birds from getting its accustomed diet of larvæ, insects and kindred food?

EDWARD BANKS.

IMPORTED BIRD PESTS IN AUSTRALIA.

From the London Field.

Some few months ago a South African correspondent of the Field asked for information regarding a proposed importation of the common starling (*Sturnus vulgaris*) to South Africa, particularly requiring to know whether there was any danger of its becoming a pest. In reply, Mr. W. B. Tegetmeier strongly emphasized the necessity for caution, exemplifying analogous cases of imported birds and beasts that had become great pests in their adopted homes. In this Mr. Tegetmeier advised very wisely, and if there is any country that has suffered, and is still suffering, to the extreme from the ill-judged acclimatization of foreign birds and animals it is Australia. The chief animal pests of Australia are mostly imported, and they include the rabbit, hare, fox, sparrow, and minah, and to these will shortly be added the very bird that your South African correspondent wished to import—the starling.

The sparrow, of course, is the bird pest par excellence at present. The present writer remembers well the first sparrows that were seen in his native town, in Central Victoria, and the enthusiasm that the impudent, common looking, little brown visitors excited in the British-born residents. It would have been a risky proceeding to have killed a sparrow in those days. That was not much more than twenty years ago, and yet to-day sparrows are to be found in myriads over practically the whole of the continent. Every hedge is alive with them, and they swarm in thousands over the farm and grass lands of the country districts, while the gutters of the towns are full of them. They are such a pest to fruit and grain that many shire councils sell poisoned grain at cost price to encourage their destruction, and many agricultural societies give bonuses for eggs and heads, and offer prizes to boys for the largest collections of eggs and heads during a season. Like the rabbits, every man's (and boy's) hand is against them; but—still like the rabbit—they continue to increase. The climate is so equable that they breed more freely than they do in Britain, and they have no trouble in securing food the whole year round. So that the day when the first pairs of sparrows were let loose in Victoria is a black letter day in our calendar.

In spite of this lesson, however, the indiscriminate importation of foreign birds continues. Such birds as the thrush, goldfinch and blackbird were thought to need no apology, and so far but few complaints have been heard of them. The finch has spread over a large portion of Victoria, as has also the thrush, but the blackbird is not so common. The showy appearance and rather pleasing note of the starling were probably thought sufficient to justify his importation, together with the fact that his British diet was mostly insectivorous. But, during the past two years, stories of his depredations in orchards and vineyards have been increasing so alarmingly, that at last definite action is to be taken. During the vintage of 1902, in March and April, a well-known South Australian vigneron wrote to the press in the following strong terms:

"During the present vintage the birds have been exceedingly troublesome at M'Laren Vale. Immense flocks of starlings, estimated at over 3,000, have been

hovering about the district during the grain season. It has been a difficult task to keep them off the vineyards. I have had to employ seven men for at least a month to shoot and frighten them. . . . Starlings have been considerably worse this year, and appear to be largely augmented in numbers. I can't see how we can reduce them, as they have three broods in the year, and there are, perhaps, four or five in a brood. . . . One cannot get at their nests, as they build in high trees and inaccessible places. As far as I know, no one has succeeded in poisoning the starling, like sparrows. Starlings are bound to be a serious trouble to vignerons in the future."

This year so many complaints were made in Victoria that the Government entomologist, Mr. C. French, has instituted a special inquiry into the matter, and has issued circulars requesting information. Up to the present the replies, according to the horticultural editor of the Melbourne Leader, constitute a heavy indictment of the starling. Mr. E. Hopton, one of the oldest and best known horticulturists in Victoria, whose property is situated near Geelong, after stating that his English experience was to the effect that the starling rarely ate fruit, reports that:

"Here, however, the bird has developed into a pest of the worst order. . . . Two years ago I dissected several starlings, and the stomachs were filled with grape seeds and some cherry stones. . . . The starlings fly in flocks into the cherry and apricot trees when the fruit is ripe, and destroy as much, if not more, than they eat. After the cherry and apricot season is over, they direct their attention to the apples and pears."

Mr. J. Brunning, another well-known grower of fruit, had a remarkable experience:

"A flock of starlings, about 600 in number, visited my orchard, and within half an hour destroyed the fruit on trees covering about eight acres, a fine crop of Jonathan apples suffering severely."

The Bendigo Vine and Fruit Growers' Association—one of the largest in the State—has decided to support the abolition of the close season for starlings, and the Fruit Growers' Annual Conference, held in Melbourne in August, carried a resolution to the same effect.

It will be seen, therefore, that the starling pest has become a serious matter. Curiously enough, as the preceding paragraph implies, the starling at present is protected by statute, the protection being actually for the whole of the year. The penalties, too, are heavy. For killing a starling a £2 fine may be imposed, and for poisoning one £10, while 10s. per egg is the fine for nest robbing. In each of the first two cases the value of the birds, £1 each, is added to the fine. Even when this now ridiculous protection is removed, as is certain to be done shortly, the orchard owner will have a difficult task before him to keep down the pest.

This experience is, therefore, another serious warning against the indiscriminate acclimatization of birds, and one of the chief facts that it teaches is that birds which may be harmless, or even useful, in their native countries, often turn out the very reverse in the country of their adoption. Another lesson taught is that the climatic and other conditions of their adopted country may induce them to breed more freely than was formerly their habit, and to in other ways increase their numbers unchecked. These two facts alone indicate the pitfalls and difficulties that beset the path of that well-intentioned but always dangerous person, the acclimatizer.

F. R.

The Texas Prairie Dog.

Editor Forest and Stream:

The prairie dog in western Texas is doomed. That is, he is if an act of the Legislature will have any effect in his case, but I am afraid that it won't.

Except the sheepman and his sheep there is probably no living thing in Texas, not even the gray wolf, that gets more left-handed compliments from the cattlemen than the little prairie dog. A colony of them can, in a short time, destroy as much grass as would support 100 head of cattle. Destroying it is the proper term, for they not only eat off the grass, but dig down to the roots and eat them also. The sheepman and his sheep can be got rid of; he and they can be run off, but not the prairie dog. He stays and multiplies. The rabbit has been given the credit of raising large families; the prairie dog can give the rabbit not only the cards and spades, but the rest of the pack, and then beat him when it comes to increasing the population.

When he has killed off all the grass in his neighborhood, and has made it more of a desert than it was before, he does not remain to starve, not by any means; he just moves on further west and begins in a new spot.

Cattle won't eat grass that sheep have been grazing over; this is why cattlemen and sheepmen cannot live in the same county. But the prairie dog does not leave them any to eat where he has been grazing.

Some of the ranchmen have tried to feed the dog on poisoned wheat; it does not work. A few dogs in each of the colonies are wise enough to let the wheat alone and confine their diet to grass; and they, after the rest have been killed off, soon restock the colony again.

The bisulphide of carbon works better; it can be poured down into the burrow, then the mouth of the burrow stopped up and that finishes the dogs in there; but while one man is doing this, his neighbor, who also has a large colony of dogs on his ranch, lets them alone, and they soon send out a colony to replace the one that has been smothered to death.

The last Legislature directed that in each county in the State where the dog is found an election shall be held to determine if he shall continue to be found there or not; and if a majority of the voters say he shall not, then he will have to go; and anyone who has him and who does not kill him will be fined. But the penalty is not large enough, and in consequence of that some men will do as they are doing now, let the dogs alone and run the risk of having to pay a fine. The risk of being fined is not great. Before he is fined a man will have to be sued by his neighbor, and he won't often be brought to book; his neighbor will not want to start a feud that might hurt him worse than these dogs would.

The law may work, but I doubt it; and from what I know of these dogs (and if I don't know them now it is not the dogs' fault; I have seen enough of them and kept them as pets), and if I might be allowed to express an opinion, it would be that the grandsons of these men about the year 1953 will still be killing prairie dogs, and will have left enough of them after they have got through with them to employ their grandsons in their turn along about the close of the century.

I would be sorry to hear that the comical little rascal had gone to join the buffalo. He is one of the most prominent objects to be met with in some parts of southwest Texas, he and his town often being the only things except sage brush to be seen for miles in any direction. He will sit up on his hind legs at the mouth of his hole and bark at the passing stranger until you pull a trigger on him; then just the fraction of a second before your ball reaches him he is down in his hole out of sight.

You may think you have hit him, but if you watch that hole a few minutes you will see his head stuck out of it; he is trying to find out whether you are still there or not. It was only the atmosphere you hit, not the dog.

I have seen a good many of them shot at, and have wasted more shots on them myself than I would have done if I had the ammunition to pay for, but I never saw many of them shot.

CABIA BLANCO.

Mammals from Old and New Mexico.

Two papers by Dr. J. A. Allen, extracted from the Bulletin of the American Museum of Natural History, describe certain mammals collected by J. H. Batty in New and Old Mexico, the Mexican provinces investigated being Durango and Sinaloa.

The country passed over had been almost unworked by collectors, and is quite distant from any point where thorough collection had previously been done. The altitude ranges from 6,800 to 8,500 feet, and the mammalian fauna, while scanty is unexpectedly rich in new form, while in respect to coloration and some other features, its species present distinctive peculiarities. As a whole, the fauna of this region more closely resembles that of the southern border of Arizona than it does that of the upper Rio Grande region of Texas and New Mexico.

The collection contains about 600 specimens representing 34 species, measurements taken by the collector in the flesh are in most cases given.

Among the animals described are a number of new species and sub-species, of which the most interesting to the sportsman are two deer, one of them called after the collector, *Odocoileus battyi*, is of the Virginia deer type and is similar in size and coloration to *O. couesi*, but is markedly different in skull. This animal, according to the collector, is not a timber deer, but frequents the high, almost treeless, mountain tops, like a mountain sheep. It is said to be not very common, and to be hard to approach on account of the open character of the country.

The other deer, *O. sinaloa*, is also of the white tail deer type. It is represented only by two young males.

The new lynx, of the bay lynx type, comes from near Escuinapa, in Sinaloa, and has received its subspecific name from that town.

A new coyote (*Canis impavidus*) from northwestern Durango, adds another to the multitude of small wolves of the West. It appears that in Mexico coyotes are much the same as elsewhere, for Mr. Batty says in his notes that in the valley of the Rio Sestín, "coyotes greatly annoy the ranchmen in the winter months. They are very bold, often entering corrals in the day, killing calves, sheep and goats. I have known them to take small pigs from the steps of the squatters' huts." Some of them also entered his camp one night and tried to steal deer skins, which were lying about.

A Story of a Spotted Adder.

THIS important news item was published in the Boston Post, Sept. 24, 1903, as a special dispatch from Hobart, N. Y.:

BABY'S FIGHT WITH SNAKE.

TWO-YEAR-OLD CHILD PROBABLY FATALLY BITTEN.

HOBART, N. Y., Sept. 23.—Two-year-old Helen Vandusen, the daughter of William Vandusen, was probably fatally bitten in an encounter with a spotted adder while playing on her father's farm near here. She fought the snake and was bitten four times, the reptile finally being killed by her mother, who was attracted by the cries of the child.

A well-known Boston sportsman who read it was moved to investigate the basis of the yarn; and to that end addressed a letter to the postmaster of Hobart, with questions, which, with the answers, are given below. The letter of inquiry explained: "There is a dispute between another person and myself as to whether a spotted adder is poisonous or not. There is no book on snakes which acknowledges that this variety is poisonous. Would it be too much trouble, or asking too much of you, to answer any of the following questions in stamped envelope inclosed?"

The questions and answers were:

Is any such family known in your place? Yes.

Have you ever heard of such accident? Yes.

If there was is there any truth to the story? Two small children out playing; no one saw the snake; more likely a dog.

Did the child get bitten? Yes.

If so, was she poisoned by the bite? No.

Was it a spotted adder? No.

Is the whole story a fake? Just about, only child was bitten.

If true, did the child die? No.

A Peculiar Moose Head.

Editor *Forest and Stream*:

In answer to your letter requesting me to give you some information concerning the capture of my interesting moose, I inclose a photograph showing the unusual growth of antlers; a double palm on one side, double brow antlers on the other.

The only incident of note in the capture was that my rifle missed fire twice. We were hunting at the headwaters of the Joco River in Ontario. I had seen ten moose on this trip without firing a shot, for none of the heads were of exceptional size. The cow and calf accompanying the old fellow started when we were about 25 yards away; my Indian Francois had been tracking them for some half hour; a moment later we saw the old bull walking away showing only a little patch of his side here and there as he passed between the hard wood trees. When the hammer of my rifle clicked he stopped and turned, apparently quite willing to dispute possession with my rival. At the second click he turned again and walked briskly in the direction the cow had taken. There are no oaths in the Indian tongue, but we have a few spare words in our language for such occasions, and with these Francois seemed perfectly familiar; not in loud boastful

look alike. One stuffs the skin full to the limit of its stretching capacity, giving your moose an altogether Hebraic expression; another folds the skin under, tucks it away, shrivels it up till your moose looks ashamed of having a nose at all. The truth is, the nose is ever changing in shape.

The nasal bones are shorter than in the horse or ox, and the septum nasi much longer and deeper, and it is the depth of this cartilage varying greatly in different specimens that gives some moose the pronounced Roman nose. The muscles that lift this heavy muffle are particularly well developed (especially the levator labii superioris alæque nasi), and the play of these muscles are ever changing the shape. The upper lip, unlike the wapiti and deer, in which animals it is devoid of hair between the nostrils, is well clothed in the moose except for a little T-shaped depression in the median line; thus making the bulky, ungainly looking muffle the daintiest of instruments with which to pick up a sprig of ground hemlock or pull down a twig of viburnum.

I have on several occasions been fortunate enough to creep very close to moose when feeding—within fifteen yards, perhaps—and had opportunity to watch the play of their nostrils, when, upon showing ourselves, they tried to wind us. One time we came so close that when we stood up an old cow immediately flattened her ears and charged. Francois threw his hat in her face; this dismayed her for a moment, and then she turned to follow the others into the balsam thicket. It is amazing how silently these animals can move through the forest. There has been much written about their low shuffling gait, but, on the contrary, they trot with high knee and hock action, as any animal of necessity must that travels on a walk or trot over so much fallen timber.

There is one point in connection with the shedding of antlers that may be worth mentioning. The circular artery which nourishes the antler through the vascular covering popularly known as the velvet, is constricted by the hardening burr at the base of the antler when the

A PECULIAR MOOSE HEAD.

profanity of the city, but in suppressed, almost unintelligible tones he cursed me, the moose, the ammunition, even the rifle that he had come to believe infallible.

You may know that I was a little flurried; more so, perhaps, than in any hunting experience, for I could see that the moose was of great size, and I realized that if the next cartridge failed he would be out of sight; but the third cartridge did not fail.

While paddling across Island Lake to camp, I asked, "What were you trying to tell me when my rifle missed fire?" The answer was: "Seems want get very big moose, seems dunno how."

While no harm can come to any gregarious species through the killing of a few old males, yet the killing, the taking of life, is the only unpleasant part of a hunting trip. Childhood is destructive. The boy who experiences no sensation save of delight, providing the teacher does not catch him while pulling the wings from a fly, or in successful rifle practice upon the neighbor's cat, growing into the wider fields of sport and thought, following the game into its home, acquiring a knowledge of its life, becoming acquainted with it, begets an interest and a love for it above the killing, and frequently the most successful hunters become the strongest advocates of game protection.

It is not the sportsman who destroys the game, it is the sportsman who protects it; but so long as man is a flesh-eating animal, so long as the law of the survival of the fittest obtains, so long as one life must be sacrificed that another may be prolonged, so long will mawkish sentimentality be out of place in game preservation.

And yet are there not thousands of hunters who each year pack upon their backs meat that someone has killed in Chicago, labor for days to carry it in to some remote camp, and eat of this product of life that someone has taken for gain rather than kill their friends of the wilderness—friends they have learned to love?

I have written all this because there seems to be a widespread impression that the man who goes for a little while each year to be rich without gold, content without gratified ambition, for a little while to be free—an impression that he goes to slay.

One of the first questions visitors ask in examining my moose heads is, "Why do they have such a nose?" No two moose look alike. No two taxidermists make them

latter has attained its growth. The velvet now dies and drops or is rubbed off against saplings. A little circulation is still maintained directly into the base of the antler. In verification of this I once found a dead moose that had become cast by his thigh being caught beneath a projecting point of rock. Whether he had been shot before being in this predicament or cast by accident I am unable to state, as he was lying in such a position that we could not turn him over to examine the under side for a bullet wound. In his struggles he had broken off both antlers at the shedding point, but before the shedding season—it being about the middle of October. The moose had so recently died that the blood was still oozing from the skull surface where the antler had been attached. But very little blood passes in this way, however, and so far as nourishment goes the antler is practically dead tissue.

There has been a great blood supply given to the rapidly growing antler; this is suddenly cut off and deviated into the general circulation. Isn't it quite possible that the physiological congestion so produced has some bearing upon the sense of vigor that comes over males of all the deer family at this season, and accounts for that restless, running, fighting mood which constitutes the rutting time, and which precedes the rutting period?

HAMILTON VREELAND.

The Connecticut Game Supply.

NEW YORK, NOV. 14.—*Editor Forest and Stream*: As my summer residence is in New Haven county, Conn., each fall during November I hunt there after partridges and quail, and it is a painfully but plainly evident fact that game of all kinds is not gradually but rapidly disappearing. This fall partridges and quail were scarce indeed.

Unless the Legislature of Connecticut speedily passes a law making not less than two closed seasons on game birds, and further allowing shooting only during the month of November, there will soon be no game birds at all. The imperative need of this is staring us in the face. There should be no halting in deciding that closed seasons must at once be ordered.

Every effort possible should be exerted to save and protect the game in Connecticut.

COURTLAND BARCOCK.

The Adirondack Deer Season.

UTICA, N. Y., Oct. 16.—Guides, woodsmen and veteran hunters generally seem to be of the opinion that there are more deer in the Adirondacks now than there were twenty years ago or even a decade since. The fact that the deer are apparently gaining ground slowly but surely under the partial protection that is afforded them is extremely gratifying, for it seems to indicate clearly that with an augmented corps of game officials and a better enforcement of the existing laws, they would in a few years become so plentiful that almost anyone who desired to do so could easily obtain a shot.

It is not thought that the aggregate number killed this fall will greatly exceed the total of a year ago. More satisfactory results could not reasonably be expected than were obtained in 1902, for the number of deer killed then exceeded that of the average for recent years. The conditions were such during a good part of this season as to render it difficult to move about in the woods a great deal without making noise enough to alarm anything but a fool deer. In the Adirondacks deer answering to this description are notably scarce, for their education has not been neglected, and they invariably act as if they knew by instinct, intuition or knowledge born of past experience, when the hunting season begins and whether a man is carrying a gun or a fishing rod. It has repeatedly been observed that deer which were apparently quite tame and lacking in fear of man during the summer months, would forsake their old haunts with the advent of September and flee for their lives at the cracking of a twig under the human foot. They may not have been shot at or pursued, but they seem to realize that they are in danger, and act accordingly. It may be argued that this is purely imagination on the part of the hunters, but there are many who believe that the deer know a thing or two which the public generally does not give them credit for knowing. In various portions of the Adirondacks this peculiarity of the deer was particularly noticeable this year.

During the summer the animals were seen in unusual numbers, often times in localities which they had not frequented before for many years, and they were reported to be very bold. But after Sept. 1 their habits underwent a decided change, for they manifested no inclination whatever to show themselves. It is time that a few of the less wary ones were shot during the opening days of the season by hunters who were watching for them on the ponds, lakes and streams in the wilderness, but these were exceptional instances, and subsequently this mode of hunting proved almost futile. Still-hunting was attended with but little better results so long as the foliage remained intact on the small trees and bushes, for it was impossible to see any considerable distance in the depths of the woods. By the last week in October, however, the leaves had mostly fallen, and the conditions for hunting were vastly improved, particularly so as there were two or three light falls of snow. Hunters then began to do more deadly work than they had been doing previously, and it is safe to say that the bulk of the deer killed this fall were shot within the past three weeks. It is a subject of such common remark among hunters who have visited the Adirondacks this year that they have seen a good many deer which for various reasons they did not shoot at, it tends to strengthen the belief that deer are more numerous there than they were at one time.

Owing to the unfortunate precedent which has been established in past years, the public has come to look for a formidable list of shooting accidents in the Adirondack region, during the deer hunting season. This fall, as usual, there have been a number of such casualties, although not as many as in some years. Deer hunters are evidencing a greater degree of caution than they did at one time, and it is gratifying to note that the dangerous practice of firing at every moving bush on the theory that there is probably game behind it, is rapidly dying out. Many hunters now wear red hats, red coats, red or white sweaters, and red shirts, while roaming about the woods in quest of deer, and it is believed to be a very commendable idea and a wise precaution. Bright colors do not alarm the deer, and the hunter who is attired in red has exactly as good a chance of obtaining sight of game as he would if he wore brown, gray or black, while the risk of his being mistaken for a deer or bear by some other hunter and perforated with a rifle ball is materially lessened. In the majority of cases the hunter who frightens a deer so that it escapes before he can obtain a shot at it, does so by some noise which he makes and not by the color of his clothing. Men who are experienced in woodcraft insist that it makes little or no difference, so far as alarming the deer goes, what colors a person may see fit to wear, for it is his movements, which in nine cases out of ten cause the game to become suspicious and seek safety in flight. Even though the hunter is moving noiselessly, if the deer sees him and observes that the strange object which has attracted its attention is in motion and probably approaching, that is sufficient, as a rule, to frighten the animal. In view of these facts, it is safe to assert that the red-coated hunter, if he happens to be standing or sitting still at the moment a deer discovers him, will be far less likely to alarm the animal than a man attired in any color would while moving about. Guides and hunters alike have come to recognize the necessity of exercising great caution in order to guard against shooting casualties, and it is now a common thing for members of a hunting party to warn each other before starting a day's trip not to shoot at any object unless they know positively that it is not a human being. It is sincerely hoped that people who frequent the wilderness on hunting excursions will continue to use due caution in this respect, as this is apparently the only way in which shooting accidents can be prevented. Reports from Sullivan county indicate that the deer hunting season in that part of the State, which began Nov. 1 and closed yesterday, has been an exceedingly lively one. There were upwards of 500 hunters on hand for the opening of the sport, and it is probable there

were at least a thousand men in quest of deer in that county during the fortnight that shooting was permitted. Many more deer were killed there than were taken last season. One of the finest specimens shot was a twelve-pronged buck, weighing 220 pounds, which was killed by Bruce LeRoy. The last fortnight was the second open season on Sullivan county for seven years, that of 1902 being the first. Deer are said to be very plentiful in the Catskill State Forest Preserve.

Many very large bucks were among the prizes secured in the Adirondacks. George Benton, of Utica, while hunting near Minnehaha in the Moose River region, early in October, shot a ten-pronged buck weighing 230 pounds. The latter part of October Seth W. Pride, of Holland Patent, brought down a 250-pound buck at Horn Lake. Schuyler S. Bardlong, of Chicago, while on a hunting trip near Star Lake, brought in a buck weighing 250 pounds and with antlers having seven prongs. Captain William Connor, of New York, while stopping at the De Forrest Angling Association club house, not far from Boonville, went out shooting and killed a 250-pound buck having handsome antlers. One of the largest deer ever killed in the northern part of the State, was shot by Ed. Flood, an old hunter, and exhibited in Antwerp last month. It was a 15-prong buck and weighed 247 pounds hog dressed, the estimated weight when first killed, being 300 pounds. It was shot near Alpine, twelve miles from Antwerp. Last Saturday the carcass of a buck weighing 250 pounds, bearing the card of J. F. Dorrance, Camden, was shipped through Utica by rail. A mammoth buck, weighing 300 pounds, consigned to a New York man, was also shipped through here on the same day. It is estimated that about 1,000 carcasses of deer have been handled by the American Express Company at Utica during the season which just closed. This city, being the southern terminus of the Black River division of the Rome, Watertown and Ogdensburg Railroad, which skirts the western portion of the Adirondacks, as well as practically the terminus of the Mohawk and Malone Railroad, which traverses the heart of the great wilderness, is the natural outlet for a vast territory, and the shipments of venison to and from this point are annually very large. It is generally conceded that there were more hunters in the Adirondacks this fall than ever before, but whether or not the statistics will eventually show that the number of deer killed was larger than in any preceding year remains to be seen. In addition to the cervine animals, which have been shot by Adirondack sportsmen during the past few weeks, several large black bears have been killed at different points in the wilderness and along the outskirts.

W. E. WOLCOTT.

In Massachusetts.

BOSTON, Nov. 14.—*Editor Forest and Stream:* This week has been crowded with events of interest to sportsmen. Mr. Wm. Dehon King, of Newport, R. I., just returned from a moose hunt in New Brunswick, called to show several fine photos which he took of the large bull which he secured, and gave a graphic account of the event, which led up to his success in obtaining a choice head. Mr. King left on Wednesday for a foxhunting trip in southern New Hampshire. From Mr. A. D. Thayer I obtained an interesting rehearsal of the successful trip of the Franklin sportsmen and others to New Brunswick. Mr. Thayer's brother Herbert, member of the Legislature; Dr. Martin, Messrs. Rockwood, Hosea, Stott, Woodard and Chapman, all of Franklin, Lawyer Baker, of Brookline, and Mr. Brown, of Wrentham, were of the party. They went in from Vanceboro to the camps of the Rockhaven Hunting and Fishing Club, which has a membership of sixty, chiefly from Massachusetts. Mr. Hosea got a bear. Mr. Thayer and others succeeded in getting deer. Mr. Thayer says it is a fine region for game, that thirty-five deer, besides moose and bear, have been killed by visitors to the camps this year.

On Wednesday evening, Nov. 11, your correspondent was royally entertained by the Greenfield Sportsman's Club, at the annual game supper. Venison, 'coon, pigeons and rabbit pie were features of the menu, and the work of the chef was first class. The president, Mr. Charles C. Russell, introduced Major A. N. Pierce as toastmaster. The Major put the members in good humor by several anecdotes, and showed much readiness as an experienced master of ceremonies, not forgetting to emphasize the important objects for which the club was organized. There were about 140 members at the tables, nearly all of whom are practical sportsmen. Among the speakers were Mr. Gerett, member of the Legislature last winter; his successor, Mr. Atherton, and Representative Ward, who has been re-elected for the coming year. Messrs. Gerett and Ward spoke in terms of high praise of the work of the State Commission and expressed their great appreciation of the courteous bearing of Captain Collins in their intercourse with him last winter, and of the ability he has shown in conducting his department. If the Captain could have heard all the good things said of him and the many regrets expressed for his enforced absence, I think it would have added some years to his life.

President Russell and his brother officers have reason to congratulate themselves on the flourishing condition of the club. Among the speakers were Vice-President Dr. L. A. Newton, Dr. Severance and several other members of the club.

It afforded your correspondent much pleasure to renew the acquaintance made last year with Secretary J. D. Fontaine and Directors D. W. Collins and Wm. Leipple.

President Russell and others had plans for going out for birds the next day, but they all told me they had found the partridges scarce this season. Deer are frequently seen in all parts of Franklin county.

Thursday evening the State Association had its first meeting of the season at the Copley Square Hotel with a very good attendance. President Reed occupied the chair, and a committee of seven was appointed to nominate officers for the coming year, of which Dr. E. W. Branigan, the librarian, is chairman. Mr. Ivers

W. Adams gave a very instructive and interesting talk on salmon fishing, in which he has had great experience in New Brunswick waters. Two of the most experienced moose hunters of Massachusetts, Dr. M. A. Morris and Dr. Heber Bishop, described their recent experiences in New Brunswick to the great delight of all present.

These descriptions were so vivid and brought out so many valuable points in reference to methods employed that I will try to furnish your readers an abstract of them in a future letter. Several of those present who are accustomed to hunt moose have said to me that they would not have missed that meeting for a good deal.

Last Monday an officer, while attempting to arrest two Italians with guns, in Middlesex Falls, was shot in the face by one of the miscreants. The one who fired at the officer escaped, but his companion was captured. The officer's face will be disfigured, but fortunately no shot entered his eyes. I wrote you previously in regard to Tom Burney's experience. It is devoutly to be wished some of these scoundrels could be punished to the full extent of the law as an example.

Mr. I. O. Converse, president of the Fitchburg Rifle and Gun Club, was one of ten new members elected on Thursday to membership of the State Association. He spoke of his experiences in the brush in (northern) Worcester county. Woodcock, he says, have been more plenty than usual, partridge not quite up to the average.

Mr. Kinney says in towns near his city there are hardly any partridge, and he regards the situation as very serious. Taking a look through Faneuil Hall market to-day, I was surprised to see the dearth of all birds of the season, except ducks, and these not over-abundant. Several recent accidents to hunters in Maine are reported, one in which Mr. E. C. Lewis, of Cambridge, mistook G. H. Spinney, of Staceyville, for a deer.

Colonel Wm. A. Gaston, recently candidate for Governor of Massachusetts, is now on his way from Maine, where he secured two bucks.

I am indebted to Col. E. B. Parker for returns from Windham county, Vermont, showing that 45 deer were shot there this year, about twice as many as last year. The bear shot by Mr. Howard on Mt. Tabor, is reported to have been quite a source of profit—\$10 as bounty, \$30 for the hide, \$40 for oil obtained from the fat.

Dr. Heber Bishop left to-day for Chain of Ponds, Maine. Several members of the Runaway Club, with guests, are going to Clearwater (Allen's Mills), Maine, next week.

CENTRAL.

Maine Records.

BANGOR, Maine, Nov. 14.—*Editor Forest and Stream:* The week just past has proved to be a record breaker, just as your correspondent came near predicting it would when writing a week ago. Among the noticeable records broken by the week's shipments are the records for a day's shipments, which in number of deer and number of total pieces of game passing over these railroad lines which center in this city was greater on Friday than in any day since a record began to be kept, and again in the number of non-residents, proportionately, taking game out of the State for this season. On the day in question, the 13th, the total shipments of deer amounted to 202; of moose, 14, making a total of 216 pieces handled by the express agents who run into this city from eastern and northern points.
